THE ECONOMY OF FUEL.—D. C. Clark in his work upon the economy of fuel says, "that only two methods present themselves, by which the supply of air and the want of the furnace can be made to correspond—either both must be made constant and regular or the fluctuations of one must be made coincide with those of the other," and he proposes to achieve the desideratum sought by an increased supply of air at the cooling by throwing open a sliding valve in the face of the door, which immediately commences closing slowly and automatically, and affords a greatly diminished supply of air to the furnace in harmony with the greatly diminished requirements of the fuel. The area valve, and the period of time throughout which the act of closing is to be prolonged being adjusted according to the nature of the coal and the average quantity supplied at one time. The outer furnace should be double and the air should pass into the furnace through a series of perforations in the inner plate. By this arrangement three important points are secured. First, the heating of the air; second, its subdivision into minute jets; and third, the keeping of the outer surface comparatively cool and thereby both economizing heat and preventing its radiation outwardly to the attendants.

MACHINERY AND ITS APPLICATION.—To a representative of a past epoch the new applications of machinery and the new methods of manufacture are a revelation, but there are stranger things in store for their successors now coming upon the stage of action. There is yet a vast reserve of mechanical skill to draw upon, and the inventive genius of the age is only just beginning to be developed. The skillful machinist of to-day may seem a veritable ignoramus in the eyes of posterity, and the man of the next century will undoubtedly find much in the changes of a single generation to challenge his astonishment and defy his comprehension. We of the present do not realize that a boundless field of discovery is opening up to us, and that new explorations are being and will be made. Thus, at every step, we shall find new and better, shorter and cheaper methods, and that certain principles and devices are capable of being indefinitely extended. Though past achievements border upon the domain of the marvelous, they are but the alphabet to the possibilities of the future.

A METALLIC TELEGRAPH POLE has been adopted by the Canadian Government for its telegraph lines on the northwestern prairies. The pole is constructed of malleable galvanized iron, and one and one-half inches in diameter at the top, and two and one-fourth inches in diameter at the bottom, and weighs less than 50 pounds. The bottom of the pole is set into a claw-plate, upon which the earth is closely packed to a height of about two feet. Then another plate is put into place around the pole and the earth is packed upon it to the level of the ground. The claw-plates take a hold in the ground at once, so that the pole becomes solidly fixed immediately after being set, which desideratum is only obtained by the ordinary wooden pole, after it has been in the ground for at least a year. A recent test is said to have shown the great strength of the pole, as a heavy No. 6 Government wire was strung, and the poles subjected to the greatest possible strain, but without moving them in the least.

THE MATERIAL USED IN KNIFE HANDLES.—Few people know the exact nature of the material generally used in knife handles. Aside from bone, tortoise shell and pearl, with which nearly everybody is familiar, the majority of knife handles are made of a wood known to the trade as cocobola, which is imported in large quantities from Panama. It is of special value for the purpose on account of its close texture, freedom from knots and flaws, and consequent disinclination to split. Many well known kinds of wood require varnishing and polishing and filling up of crevices before they attain the beauty for which they are famous. It is brought to this country in chunks, not in strips and planks like other woods. Sometimes the pieces weigh 500 and 600 pounds each, but generally much less. It costs two and one-half cents a pound.

THE BEST WELD.—Mr. Purvia, an English engineer, read a paper before the Institution of Naval Engineers on large forgings. Speaking of the different kinds of welds, he gave the preference, for heavy work, to the scarf weld, and considered the long V weld next best. He submitted some large specimens of welds, made by the use of sledge hammers, screws and the steam hammer. Upon trial all of the welds broke at a red heat, by being bent, except the one made under the steam hammer which was repeatedly bent forward and back till black hot, and then broke elsewhere than at the weld.

SCIENTIFIC PROGRESS.

Science in the Dye House.

The many discoveries made during the last 30 years in the field of chemical science, as applied to industrial pursuits, have given birth to an industry which did not exist before the year 1860. This industry is the manufacture of the coloring matters or dyestuffs which are derived from coal-tar. The many coloring matters which science has thus added to the list of dyers' supplies in this relatively short period are all derived from a product which was formerly a waste product—coal-tar—and no better example could be cited of the benefits which industries can derive from scientific studies. The effect of the introduction of these artificial colors has been to completely change the methods of dyeing textile fabrics.

The new colors, says the *Journal of Fabrics*, were first received with distrust, owing to the fact that some of them are of a very fugitive character, although most beautiful in shade; so that all aniline colors were declared not fast, and aniline became almost synonymous of "beautiful but frail." This prejudice, however, was slowly but surely dispelled by the discovery of some colors which are as fast as any natural colors can possibly be expected to be, and which are second to none in beauty and brilliancy of shade.

The production of artificial coloring matters is now calculated by millions of dollars. Europe is, of course, the great seat of this industry, Germany being the chief producer of these dyestuffs, being far ahead of any other country as regards the value of the yearly production. The United States are not occupying for this industry the place they ought to occupy as a producer, this production of coal-tar colors being very small in comparison with the consumption in this country, so that the largest portion of what is used here has to be imported. The manufacturers of coal-tar colors being what we may call a scientific industry, it is very much dependent on skill for its success and not on protective duties. This is the reason why this industry has so well prospered in Germany, the country which possesses the most perfect system of technical high schools.

The New Oxygen Process.

The new process for obtaining oxygen from the atmosphere, as introduced by the Brin Brothers, is described as follows: First, the air is drawn, by means of a partial vacuum, through a vessel of quicklime, which absorbs all the carbonic acid and moisture and reduces it to a mixture of oxygen and nitrogen. These gases are then drawn into the retorts, heated at 500 degrees, and the artificial lung absorbs the oxygen, while the nitrogen is drawn off to a gasometer for conversion into ammonia, etc. The Brins have, for the first time, made the artificial lung—baryta—indestructible. The use of baryta for the purpose is not unknown, but hitherto the baryta has been perishable, and has required renewal every four and twenty hours, at great expense. They make it virtually indestructible and unchangeable. In this way they claim to have effected an absolute revolution in chemistry; for, with a lung for the machine, and the atmospheric air for the material, they can make just as much oxygen as they like, and its uses, present and prospective, are almost innumerable and incalculable. For ventilation, aerating water without carbonic acid, for increasing the heat of blast furnaces and the light of lamps, its uses are self-evident.

The nitrogen, which was at first looked upon as wasted, has, by a process due to the same inventors, been turned into ammoniacal salts for manure. Most of the uses of these products were known. What is claimed is the almost fabulous reduction in the cost of production. The chemical text books, according to Messrs. Brin, are at fault as to the possibilities of baryta. They all teach that it is destructible; and the Brins maintain that, as they know how to treat it, it is indestructible. Oxygen in large quantities means a revolution in half the processes of chemical industries.

CHEMICAL ACTION EFFECTED BY PRESSURE ALONE.—It has lately been shown by experiment, that by the simple action of pressure upon two solids, previously thoroughly intermingled in a pulverulent condition, a chemical reaction between the two is effected. The substances experimented upon were barium sulphate and sodium carbonate. About one gram of a mixture of these two substances was submitted to compression; the cylinder produced was pulverized and submitted to the action of water, and the insoluble residue analyzed to determine the amount of barium carbonate produced. It was found that by compression of the mixture, under a pressure of 6000 atmospheres for a few seconds only, nearly one per cent of the barium sulphate had been transformed into carbonate. On subjecting the material of the first cylinder anew to compression, four times in succession, the amount of the carbonate produced rose to 4.73 per cent, and after six to 8.99 per cent. If these cylinders are left to themselves after compression, the chemical action will continue for a period of 14 days, the quantity of barium carbonate produced in the cylinder submitted to six compressions, rising, during that time, to 10.59 per cent. If the cylinder, after compression, be

divided in half, and one of the halves be heated for several hours to 245° Fahr., it is found, on analyzing the two halves, that the barium carbonate formed has actually diminished during the heating, the percentage falling between one and two per cent.

AN IMPORTANT DISCOVERY has recently been announced in connection with the new process lately introduced of extracting the saccharine matter from the cane. It has long been suspected that the presence of leaves and sheaths enveloping cane has hindered the successful production of sugar from sorghum by the diffusion process. But no careful effort to estimate the extent of this hindrance was ever made until a series of tests was undertaken under supervision of the New Jersey agricultural experiment station. The results of this study as recently published, are of unexpected importance. Not only has it been demonstrated that sugar from cane worked without leaf or sheath is of superior quality, but the expense of evaporation is so notably lessened that some cheap method of stripping the cane seems to be the only thing needed to insure financial success. A machine for this purpose has already been prepared, and the experiments will probably mark an era in the history of this industry. By the old method of pressing the juice from the cane, the best equipped mills secured only 70 pounds of the 145 pounds of sugar in a ton of cane. By first getting rid of the leaves and sheaths the diffusers secure 130 pounds.

THE ELECTRIC LIGHT ON LOCOMOTIVES.

Some time ago electric lights were fitted to the locomotives running on the Nichols Railway, between St. Petersburg and Moscow. For awhile, says the *London Engineering*, they appeared to give satisfaction, but at length the staff commenced to complain of them, and now, after an investigation by the directors, they have been totally discontinued. The lamps were powerful, throwing a stream of light a mile ahead of the train, and so far as the illumination of the railway track was concerned, the locomotive drivers and guards admitted their utility. Their objection to them was, however, that the contrast between the lighted space and the darkness on either side was so acute that it annoyed the eyesight, and in some cases, after a time, incapacitated the drivers altogether. Medical evidence was adduced by the company's doctors, proving in one or two instances the vision had been so injured as to provoke fears of blindness.

THUNDER RAIN AND ORDINARY RAIN.—There is a marked difference between the water which falls in an ordinary rain and that which is accompanied with electrical displays, or as it is sometimes called, thunder rain. Palmin says, in regard to the latter, the cloud from which it falls must be regarded as a constant flowing source of electricity. There can be no thunder or lightning without rain, notwithstanding the not infrequent assertions of thunder in a clear sky. Such reports are either from distant clouds, or the result of some other cause than a discharge of electricity. Harvest, or "heat lightning," is merely a distant storm. It is seldom that thunder is heard as an accompaniment to heat lightning—as thunder cannot be heard beyond 12,427 miles, while lightning is often seen, by reflection upon nearer clouds, at a much greater distance.

NATURE'S TRANSFORMATIONS.—In all the transformations of Nature, vegetable or animal, there is nothing more wonderful than that which occurs to the little inhabitants of the pools, known as tadpoles. A tadpole, the larva of a frog, has a tail and no legs, gills, instead of lungs, a heart precisely like that of a fish, a horny beak for eating vegetable food, and a spiral intestine to digest it. With the approach of maturity the hind legs appear, then the front pair; the back falls off, the tail and gills waste away, the lungs are created, the digestive apparatus is changed to suit the animal diet, the heart becomes reptilian in type by the addition of another auricle; in fact, skin, muscles, nerves and blood vessels vanish, being absorbed atom by atom, and a new set is substituted.

THE NATURE OF COAL.—Some investigations made relative to the heat of combustion of stone coal have led to the conclusion by Menier and others that during the formation of coal a certain quantity of heat must have been absorbed since the theoretical heat of combustion was always less than that actually observed. From want of knowledge, however, as to the real constitution of coal, it is regarded as impossible to determine the nature of this absorption. It is also a fact that, from want of knowledge as to the composition of coal, the heat of combustion cannot be calculated. It is well known that two coals of precisely the same chemical composition may and do afford very different degrees of heat in combustion.

A NEW KIND OF PAPER of very wide application has recently been introduced. Two sheets of Manila are taken and run through calender rolls, the sheets being placed with the fiber at right angles. Afterward the paper, now combined, is run through corrugated rolls. The result is a paper which can be sewed like cloth and is very durable. Such paper could be printed like calicoes or stamped like counterpanes, etc. It is a great advance on papers heretofore used as cloth substitutes.

SAN FRANCISCO:

Saturday Morning, Feb. 27, 1886.

TABLE OF CONTENTS.

EDITORIALS.—The Assaying Laboratory at Berkeley; Progress of Electricity; The Ohmen-Simmon's Valve Motion; Copper, 141. Passing Events; The International Geological Congress; Molybdate of Lead; A Profitable Gold Mine, 144. Balance for One Decigram of Ore for the Blowpipe Assay; The Inverted Siphon; Heirs to Cheateaux in Spain; The Surveyor of the Port; Mining Accidents, 145.

ILLUSTRATIONS.—Sectional View of Ohmen-Simmon's Valve Motion; End View of Ohmen-Simmon's Valve, 141. Hon. Wiley J. Tinnin, Surveyor of the Port of San Francisco, 145.

CORRESPONDENCE.—Virginia City, Nevada.—No. 4; Mineral and Metaliferous Veins, 142.

MECHANICAL PROGRESS.—A Novelty in Nail Making; To Temper Tools; The Iron Furnaces; Forming Screws on Sheet Metal Pipes; The Economy of Fuel; Machinery and its Application; The Material Used in Knife Handles; The Best Weld, 143.

SCIENTIFIC PROGRESS.—Science in the Dye House; The New Oxygen Process; Chemical Action Effected by Pressure Alone; The Electric Light on Locomotives; Thunder Pain and Ordinary Rain; Nature's Transformations; The Nature of Coal, 143.

ENGINEERING.—The New Light; The Suez Canal by Electric Light; New Railroads in South America; British Engineering; Rapid Engineering Work, 147.

USEFUL INFORMATION.—An Oil Economizer; Mine Explosions; Cleaning New Rubber Corks and Tubing; Tin Plates a Mile Long; Polished Iron Jewelry; Labor in the National Cabinet; Glass Flooring; Cementing Iron Railing Tops, 147.

GOOD HEALTH.—A "House Epidemic" of Pneumonia; Human Hair; The Thin Yankee; Clean Hands; Death Caused by Eating Dirt; Unhealthfulness of Oil Stoves, 147.

MISCELLANEOUS.—Practical Hydraulics, 146. MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Montana, New Mexico, Oregon, and Utah, 148-49.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board; Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 152.

Business Announcements.

Books—H. C. Baird & Co., Philadelphia, Pa. Plans—Byron Maury. Proposals—State Board of Silk Culture. Amalgamating Plates—S. F. Novelty Works. Chemist—F. Susteric, Big Spring, Tex. Huntingdon Mill Wanted. Paints—California Paint Company.

See Advertising Columns.

Passing Events.

There is a small gold excitement in Monterey county, not far from Soledad, an account of which is given in our Mining Summary. The region is not one where gold has been discovered before, and it does not seem probable that there will be any very big district developed.

The Honduras mines are attracting some little attention, but so far the reports received are rather vague.

In many places in the mountains the prospectors are out again and are at work. In the higher places, however, there is still too much snow for prospecting.

A good many gold mines are being reopened in this State at present. It is probable that there will be more or less inquiry for gold mines this summer, from which our California prospectors should profit.

The State Mineralogist has received a magnificent specimen of chichromate of iron, weighing over 150 pounds. It was sent from Scotland. It is entirely red in color and is a beautiful illustration of the crystalline formation. What makes it interesting is the fact that it was made out of California chroms iron. Large quantities of this iron is shipped to Scotland from California and used in the manufacture of chromate of iron and chromide of iron.

The International Geological Congress.

The meeting of the International Geological Congress was held according to the program in Berlin, and was well attended by delegates from the principal European nations. The United States was represented by Professors Hall, Newberry, Brush, Williams and Frazer.

The inception of this international gathering of geologists dates from the action of a committee at the meeting of the American Association for the Advancement of Science in the year 1876. The first congress was held at Paris in 1878, and the second at Bologna in 1881. At this Bologna meeting it was decided to prepare a geological map of Europe, and the work was confided to a committee which reported progress at this last session in Berlin. At the opening of the congress, by Professor Capellini of Italy, the president of the Bologna Congress, the Prussian Cultus-Minister, Herr Von Gossler, was introduced and gave an address of welcome in German, dwelling upon the fact that no science could advance without the aid of the other sciences. He reminded his audience that "Prussia had been the home of Von Buch and Von Humboldt, and in the name of the Prussian Government he warmly appreciated and recognized the honor conferred upon Berlin by the congress in choosing Berlin as its place of meeting and made the members welcome with the miners' greeting—"gluck auf." The proceedings of the congress were then conducted under Dr. Von Dechen, the honorary president, and Professor Beyrich as president and M. Hauchecorne as secretary, with a council of 20 members.

The geological map of Europe will be printed and published in Berlin. It will be divided into forty-nine sheets, which, when united, will form a rectangular map about twelve feet square. The topographic base will be prepared by Professor Kiepert, of Berlin. The International Committee guarantees to take 900 copies at 100 francs per copy, but the trade price will be 125 francs. Each national committee will furnish the geologic symbolization for its own country, and these contributions will be harmonized and connected under the committee of direction. The coloring will conform to the international scale of colors decided upon at the Bologna meeting, using graduated tints of the same color to represent the sub-divisions of each period—the deepest tints representing the oldest divisions. Portions of this map are completed, especially Central and Southern Italy.

The proposition to represent the Permian carboniferous formations by a gray color in three tints, and under the title of "Carbonic system," gave rise to a protracted debate. Professor Hughes, of Cambridge, England, objected to the union on the ground that the discordance between the two formations in England is enormous. M. Nikitin, of Russia, also objected. Professor Renevier (Switzerland) defended the proposition and thought the Culm, Carboniferous and Permian really constitute one system. Professor Newberry expressed the convictions of Professor Jas. Hall and his own, that in America there is no distinctive Permian but an insensible transition from the Carboniferous beds to those which correspond in position to the Permian, and that there is no strict line of demarcation between the Trias and the Permian, so-called. It was finally decided to preserve the present classification, and not to unite the two formations as one group. Objection was also made by Professor Hughes to the use of the word "Silurique," proposed by M. Renevier to include the Silurian and Cambrian, and he was joined by M. Jacquot (France), who stated, in support of the objection that the difference between the Silurian and the Cambrian could be easily seen in every part of the extensive line of contact between them in France, the Pyrenees and other places. Prof. Renevier explained that the proposition was merely to use one general color for these formations and to distinguish them by differences of tint.

The use of the names "Archean," "Primitive" and "Pre-Cambrian" was also discussed. The English geologists prefer the term Archean to Pre-Cambrian, and Archean was finally adopted. In the opinion of M. Jacquot, it is not at present possible to subdivide the Archean in France. It is deemed best to represent the mica-schists and the gneisses in the same manner. M. Firket objected to the term Azoic, as it begs the question of the existence

of life. In this report by Prof. Frazer for American delegates, attention is directed to the priority of the term *Taconic*, proposed and long defended by Dr. Emmons, and since discussed by M. Jules Marcou, in a paper published by the American Academy of Science and Arts. This term should be applied to the primordial fauna or equivalents of the Cambrian. Prof. Geikie proposed that the Congress should postpone the subject of the division of the Cambrian and Silurian until the meeting in Eogland, which was agreed to.

In regard to the Devonian, Dr. Beyrich thought it could not be separated from the Carboniferous at an absolute horizon. The three-fold division of the Trias was agreed to, and it was decided to make three divisions of the Jurassic. The troublesome and vexed questions regarding the subdivisions of the Tertiary were finally disposed of by leaving them to the committee under a unanimous vote of confidence.

In regard to the representation of the eruptive rocks, Professor Van Dechen declared that there should not be any distinction between the rocks of extinct and of active volcanoes, or between ancient and modern eruptive rocks. Mr. Blanford objected to the petrographic division of the eruptive rocks, while the sedimentary rocks are divided chronologically, and the whole matter was finally left to the committee.

The committee upon the formation of an international geological society and the establishment of an international geological journal reported favorably, but the council had decided against both plans, desiring to postpone the question until the next meeting of the Congress. The scheme of an international geological journal to be supported by private enterprise, was, however, approved.

In the closing remarks of the honorary president, attention was directed to the fact that the first scientific congress held in Berlin in 1858 was under the auspices of the Baron Alexander Von Humboldt. It was decided that the next meeting of this congress should be in the city of London, England, between the 15th day of August and the 15th of September in the year 1888, and that Messrs. Geikie, Beauford, Hughes and Topley be the committee to prepare for the proper reception of the congress. Professor Hughes repeated his statement made to the council that he had a petition signed by one hundred and thirty-seven English geologists requesting the congress to meet in London. This petition included the names of the Duke of Argyle, the Earl of Eoniskillen, and some of the most eminent geologists of Eogland. Professor Geikie said that English geologists follow the action of the congress with the greatest interest, and would unite in giving it a warm reception.

Molybdate of Lead.

Wulfenite, or molybdate of lead, is more or less abundant in Nevada and Arizona, but is found sparingly in this State. Some has been found, however, in Kern and Inyo counties. The mineral is of frequent occurrence in the ores of Ruby Hill, Eureka, Nevada. It is there found as aggregates of fine tabular crystals coating nodules of galena changed into sulphate and carbonate, and frequently mixed with crystals of the latter, as well as in minute crystals disseminated throughout the ore. Some of the galena contains considerable molybdenum, but whether the quantity contained in it will account for the presence of the considerable amount of wulfenite in some of the ore is a matter of doubt. From the manner in which some of it is found surrounding nodules of galena carrying molybdenum, and from its occurrence mixed with the other products in decomposition of that mineral, it is evident that a portion of it at least was formed by the decomposition of the molybdenum-bearing galena.

The existence of molybdenite (sulphide of molybdenum) has not been detected in the oxidized or unoxidized ore. It exists, however, in the underlying quartzite. Several specimens of this mineral were found in sinking the Richmond shaft from the 900 to the 1200-foot level; also in the crosscut from the 1200-foot station through the quartzite to the limestone. As it is usually found in the quartzite, it is in a very finely divided state, and were it not for a few exceptional specimens that have been found, its presence would have been overlooked. Mr. J. S. Curtis, in his monograph on the silver lead

deposits of Eureka, states that it is probable that its occurrence in the quartzite is due to secondary causes, and that like the pyrite, it was not an original constituent of that rock.

A Profitable Gold Mine.

The Plymouth Consolidated Gold Mining Co.'s property, Amador county, in this State, produced in gold bullion in 1885 the sum of \$850,527.44. The operating expenses were \$319,750.91, leaving a profit of \$530,776.23, which, with the surplus on hand Jan. 1, 1885, left a total of \$635,071.59. From this twelve monthly dividends, aggregating \$570,000, were paid in 1885, leaving a surplus of \$60,071.59.

This company was formed June 1, 1883, by the consolidation of the Empire, the Amador Pacific and the Plymouth Companies. The mines were well developed, and a considerable amount in dividends had been paid. Prior to the consolidation, gold bullion to the amount of about \$2,500,000 had been produced.

The following is a statement of all the receipts and expenditures of this company from its organization, June 1, 1883, to Jan. 1, 1886, a period of two years and seven months:

June 1, 1883—Cash on hand at time of organization of this company.....\$153,319.80

GOLD BULLION PRODUCED BY THE MINES AS FOLLOWS:
For the year 1883 (7 months).....\$ 527,170.50
For the year 1884.....1,033,518.97
For the year 1885.....850,527.44
\$2,441,216.90

Total receipts.....\$2,594,536.00

DISBURSEMENTS.
Operating expenses.....\$860,909.66
Construction.....165,644.03
Thirty-one dividends.....1,525,000.00
2,551,454.64

Cash on hand, Jan. 1, 1886.....\$43,081.45

With such a record it will be interesting to show more of the details of receipts and expenditures for the last year. They were as follows:

RECEIPTS.
Cash on hand, January 1, 1885.....\$74,795.06
Gold bullion produced January.....85,721.00
February.....80,974.87
March.....80,135.03
April.....82,191.67
May.....81,927.39
June.....82,616.70
July.....82,449.83
August.....73,156.97
September.....75,614.98
October.....64,951.36
November.....51,667.16
December.....49,258.49
\$954,822.50

DISBURSEMENTS.
Operating expenses:
Empire mine.....\$125,783.64
Empire mill.....16,582.87
Empire sulphurets.....2,466.03
Empire timber.....10,921.70
Empire wedge blocks.....1,576.00
Empire wood.....1,094.57
Pacific mine.....79,103.50
Pacific mill.....11,743.43
Pacific sulphurets.....2,001.34
Pacific timber.....7,608.93
Pacific wood.....59.73
Pacific wedge blocks.....209.50
Lagging.....4,803.37
Reducing sulphurets.....12,961.14
Water supply—canals, reservoirs, etc.....8,933.06
Charcoal.....370.99
General expenses.....24,806.01
\$954,822.50

Dividends.....\$60,071.59
Surplus.....60,071.59
\$954,822.50

The following has been added to construction account, and paid for out of the surplus:

Surplus.....\$60,071.59
New tunnel on lode line and development of Pacific claim.....\$5,579.37
Construction of shaft on Woolford property.....7,871.14
New tail race.....3,167.03
Tunnel from north shaft.....552.60
\$18,900.14
Cash on hand.....43,081.45
60,071.59

The cash on hand, \$43,081.45, is actual surplus, the company having no indebtedness whatever.

CALIFORNIA AT THE EXPOSITION.—We see by the New Orleans States that California inventions and industries are pretty well represented at the exposition now going on in that city, and to which Mr. C. B. Turrell is commissioner from this State. The display is spoken of as well arranged and as one of the important features of the exposition. Quite an extensive area has been assigned to California merchants, manufacturers and inventors. Among the things shown may be mentioned high explosives, borax, canned fruits, saws, soaps, hydraulic giants, quartz machinery, incubators, village carts and a number of small inventions.

THE Granite Mountain mine of Montana produced 1375 bars bullion up to January 1, 1886, weighing 1,496 522 ounces, estimated to be worth \$1,579,000.

Balance for One Decigram of Ore for the Blowpipe Assay.

[Written for the PRESS by C. H. AARON.]

In the accompanying cut, *A* is the beam, and is nothing more than a slip of wood through which are thrust, at right angles, two needles as shown.

B is the support, made of a strip of tin sheet suitably bent. The top edges should be parallel and smooth.

C is the base—a piece of board, to which *B* is fastened.

D is the pan, made of tin sheet. The top at *D* may be flat or concave. The legs must be so heavy that the pan maintains its position when suspended on the needles and loaded with a decigram of ore, etc., and so long that the pan may rest on them when the beam is slightly declined at that end.

E is a counterpoise made of lead. It is movable on the beam, yet is not so loose as to slip of itself. The center of gravity of *E* should be, as nearly as possible, in a line with the two needles—that is to say, the portion of it which is below a line passing through the two needles should equal in weight the portion above such a line.

To use this balance, put the decigram weight on the pan and adjust the counterpoise so as to lift the pan about an eighth of an inch from the base. Remove the weight from the pan and replace it by ore, reproducing a same condition of equilibrium. Place a finger under the counterpoised end of the beam and raise that, letting the pan rest on its feet. Remove this pan and transfer the weighed ore to the mixing capsule.

The delicacy of the balance will depend greatly on the adjustment of the center of gravity, as in all balances. If on trial the beam is found to tumble to either side indifferently, when equally or nearly equally loaded on each end, the center of gravity is too high and must be lowered by cutting away some wood above the line joining the needles, or by attaching a bit of lead to its lower edge (at the middle is best). If, on the other hand, the beam swings so that it can be balanced, but is not sensitive enough to small variations of weight on either end, the center of gravity must be raised either by whittling from the lower edge or by loading the upper edge suitably. With fine needles and a good adjustment this balance is sensible to one milligram or less.

The lead counterpoise is not to swing freely, but is compressed on the beam so that it forms practically one body with that. The pan, on the contrary, must have free movement, hence the legs must be apart so as to straddle the beam without touching, and care must be taken that they do not touch; this gives width on the top for the ore. All those balances in which the weighing is done by placing the object to be weighed or the larger weights on marks on the beam are unreliable. Although they may be sensitive to a thousandth of a grain, there can be no certainty of placing the object or the weight so that its center of gravity is precisely coincident with the center of the mark, and the error thus introduced may greatly exceed the limit of sensibility of the beam itself. The very small weights may properly be used in this way as the riders of an assay balance, because the possible error in place of the rider cannot cause a material error in the weighing.

The Inverted Siphon.

We would call attention to the discussion of the inverted siphon by P. M. Randall in his series of articles on practical hydraulics, as it is new and of the highest practical importance. Mr. Randall in this discussion, not only points out that in practice the inlet end of the inverted siphon may be placed either too high or too low in its relation to the outlet end, but rigidly demonstrates the proper point so as to attain the greatest economy. Several examples, it will be seen, are given, which fully verify the correctness of his result. The saving effected by the application of the principle enunciated and demonstrated by Mr. Randall is surprisingly large, amounting in extensive operations to immense sums of money. The verification of this statement will be clearly shown by the application of this principle to practical examples in this number of the PRESS.

An apparently inexhaustible quarry of rock salt has been found near Dona Anita, N. M.

Heirs to Chateaux in Spain.

Year after year the State Department at Washington, and the various U. S. legations in Great Britain and on the continent, have had letters showered upon them, heaps upon heaps, asking information about supposed estates awaiting heirs and alleged unclaimed fortunes, in this or that portion of the old countries. Again and again has patient and careful investigation been made by our representatives abroad, when the data furnished by

that came before the association—if we may judge by the reports published in our San Francisco daily papers—was to assist a certain person in taking a trip across the Atlantic, to ascertain the exact status of the Towneley estate. But this measure appears not to have been decided upon; and as the information thus to be sought has already been given at some length in a circular letter from the Secretary of State (a copy of which we have just received from the department) we hope to do the "heirs" a service, and save them need-

HON. WILEY J. TINNIN, SURVEYOR OF THE PORT OF SAN FRANCISCO.

applicants have seemed specific enough to warrant it, but never, to our knowledge, has it led to discovering the actual existence of any such property. As a general thing, however, the letters—whether from lawyers or laymen—have been so vague as to furnish no clew. "They are all more or less indefinite, many sad, and some ludicrous." "These communications often disclose the fact that the hopeful claimants, generally very poor, and misled, no doubt, frequently by de-

less expense and suspense, by now publishing it without abridgment.

DEPARTMENT OF STATE,
WASHINGTON, December 20, 1885.

SIR: I have received your letter inquiring as to an Act of Parliament passed in August last, and said to refer to the so-called Lawrence Towneley estate. Many letters of a similar character have been received both by this Department and by the legation at London. The prevalent idea of the writers appears to be that the estate in question consists of eight hundred millions of dollars, more or less, which are

BALANCE TO WEIGH A DECIGRAM OF ORE.

signing persons seeking employment as agents or attorneys, had repeatedly paid out considerable sums to prosecute their extravagant claims."

"There is little prospect of a cessation of such inquiries, and no doubt much time and money has been and will be uselessly expended, through the impositions of a certain class of a speculative turn of mind, who work upon the credulity of those who think they may have interests that can be realized." +

The latest instance of this species of hallucination is afforded by the Chase-Towneley craze. A meeting of imagined heirs, to the number of 70 or 80, has recently been held in this city, and an organization formed for the ostensible end of getting their share of a property in England. The first and only tangible proposition

lying in the Bank of England awaiting distribution among unknown heirs, among which are persons of the names of Lawrence and Chase in the United States.

I am informed by our Minister in London: First—That there is no money in the Bank of England belonging to any Towneley, Lawrence Towneley, or Chase estate, or to any claimants under those names.

Second—That there is no such estate in England as the Lawrence Townsley estate, nor any known family of that designation.

Third—That the Towneley estate is a large landed property in the counties of Lancaster and York which is now, and has been for a very long time, in the possession of its rightful owners, who are completely protected therein by the law of England, and that there are no unknown or American owners of any part of it, or any ground whatever for any such claims.

I have also received from our legation at London a few copies of the Act in question, which is a voluminous document of 288 pages. The names of Lawrence and Chase do not occur

in it. It is an act to adjust the equities arising under certain successive marriage settlements and other conveyances executed at various times between 1836 and 1877 in favor of the persons therein named. An amicable suit in Chancery is being conducted for this purpose, and by direction of the Court this Act was obtained in aid of its decree.

The statement widely disseminated in the United States that this Act affords an opportunity, or that there is any opportunity for the prosecution of any American claims to this property, is entirely incorrect. This Department is unable to furnish copies of this Act, but it can be examined here by claimants or their lawful attorneys, and could probably be obtained from London by any importing bookseller. The price of it in London is \$3.37 per copy.

You are strongly advised to pay no attention to any reports or statements of associations in reference to claims on the above-named estate, or to pay any money to agents for pressing the same. Neither this Department nor the legation in London can encourage or aid any investigations in this direction.

I am, sir, your obedient servant,

T. F. BAYARD.

We have also been shown private advices from a reliable law firm in the East, to the effect that the whole business, on this side of the water, was set on foot by designing parties, in hopes of entrapping and fleecing the credulous and unwary. But apart from this, Secretary Bayard's pointed and cogent letter ought to suffice to deter any but the most infatuated from further pursuit of such a will-o'-the-wisp, or, let us rather say, such a wild-goose Chase.

The Surveyor of the Port.

With a view to increase our readers' knowledge of men prominent in the various affairs of the State, we give from occasionally portraits of the leaders in the various lines of thought and action. We place upon this page the portrait of Hon. W. J. Tinnin, recently appointed by President Cleveland surveyor of customs of the port of San Francisco. Mr. Tinnin is a pioneer resident of California. He has been long prominent in public affairs and has gained a wide acquaintance. Born in 1829, on a cotton plantation near Jackson, Mississippi, he lived mainly in that State until 1850. He arrived in San Francisco on the bark Paola, in May, 1850. Taking up his residence in Weaverville, Trinity county, soon afterwards, Mr. Tinnin engaged in merchandising and mining successfully.

In 1871 and 1873, Mr. Tinnin served two terms in the Assembly of our State Legislature. In '75 and '76 he was a member of the Senate; in '79 he was elected to the Constitutional convention, and came within one vote of being its chairman, and for many years he has been one of the leading practitioners in the various law courts of the State. Mr. Tinnin was chosen Grand Master of the Grand Lodge of California of the Masonic fraternity, and thus adds eminence in social and fraternal affairs to his honorable record in the service of the nation.

Mining Accidents

Richard Hales received injuries at the Baltimore quartz mine, Auburn, Placer county, from which he died the next day. He was in the tunnel and had removed a false sett of timbers to put in a true sett, when the ground from the hanging wall caved upon him. His brother Sampson, who had been in the tunnel with him a few minutes before, heard him cry out, and went to his relief, but it took seven hours to rescue him. He did not think himself seriously hurt, and upon being put to bed felt comfortably, but along toward daylight he said he felt drowsy, and shortly after died quietly, caused, no doubt by internal injury.

On Tuesday last, Thomas Quinn, top-carman at the Crown Point mine, on the Comstock, was fatally injured. He was loading timbers on a car on the cags in this shaft at the second surface platform, when the cage, weighing two tons, was dropped, catching him between the upperdeck of the cage and the floor. His ribs were broken and the jagged ends forced through the lungs. The cage alone weighs two tons. The engineer claims that the cage was lowered in response to a bell from below.

HUGH LAMB, a foreman of the North Eod and Con. California & Virginia mine, died at Virginia City on the 22d. Deceased was the most noted practical miner on the Comstock. He had been in the employ of the honanza company as foreman since its organization, and his judgment in mining matters was implicitly relied on by Mackay and Fair.

*Dispatch of A. D. White, U. S. Minister at Berlin, to Mr. Evans, March 20, 1880. +Dispatch of Hon. James Birney, U. S. Minister at the Hague, March 1, 1873.

Rule 49 corresponds to Eq. (204).

ENGINEERING NOTES.

Navigating the Suez Canal by Electric Light.

In presence of the continued increase in the traffic through the Suez canal, even during the present commercial crisis, and to provide for the still greater increase that is anticipated in consequence of the abolition of the pilot dues and the lowering of the tariffs, by which merchandises now reaching Europe from the East and from Australia by the route round the Cape will be able to be sent through the canal, the company has for the last two years been making experiments with electric lights, with a view to enable vessels to continue their passage through the canal during the night. These experiments (says the Paris correspondent of the London Standard) have at length proved so successful that it has been resolved to permit, from the 1st of January next, all vessels of war and postal steamers provided with the requisite electric lights, to navigate by night that portion of the canal comprised between Port Said and kilometer fifty-four. Therefore, in almost half that portion of the canal where ships have to put into sidings to allow other vessels to pass them—in the Bitter Lakes vessels pass each other without stopping—vessels of war and mail boats, that together represent 22 per cent of the total traffic, will be able to continue their passage at all times of the day and night. This will constitute a great saving of time, and M. De Lesseps, in his circular, expresses the confident hope that the trial will be so successful as to enable him to authorize within a short time night navigation for all descriptions of vessels through the whole length of the canal.

New Railroads in South America.

The Argentine Government has recently made arrangements for a loan of \$59,000,000, which is to be expended in the completion of the railroad system of the republic, including two lines across the continent from the Atlantic to the Pacific, in order that the people of the west coast may avoid going way around the Straits of Magellan, which is a very disagreeable journey. A third line is to be extended northward into Bolivia. These are as great enterprises as the construction of our transcontinental system of roads, although the distances across that portion of South America is only about as far as from New York to Omaha. Under the terms of the contract all of the railroads are to be completed within five years from the first of January. The importance of these enterprises to the United States can not be overestimated. They will not only necessitate the expenditure of many millions of dollars for railway supplies, but the men who will be engaged in the work of construction must be fed and clothed with imported merchandise. The development of the country will increase its purchasing power, and the expenditure of nearly \$60,000,000 of foreign money within five years will give the country such a boom as it has never experienced. As this money is to be raised in England, it may be expected that a large part of it will be expended in that country, but the merchants and manufacturers of the United States can underbid those of England on nearly every article that will be required except steel rails; and if they adopt proper means they will be able to increase their exports to the Argentine Republic to a large amount, and get a fair share of the permanent commerce which this enterprise will develop.

BRITISH ENGINEERING.—The British Government has determined that the Soudan railroad through the desert from Suakim to Berber, a distance of 245 miles, shall be standard gauge, and every effort of the department will be made to push it through this season. The route is said to present no serious physical obstacles to the rapid building of a railroad, so there ought to be no difficulty in getting the road completed within four months after the first vessel carrying the labor and plant arrives at the base of operations. British engineers are not, however, famous for expedition in pushing forward railroad work. There is generally too much devotion paid to following established rules and precedents, and the system of using iron chairs for the rails to rest on, with all the additional parts entailed, is not conducive to rapid laying of track. From what we know of German military performance in rapid railroad building, we are not sanguine of the British war office getting their railroad built so rapidly as necessary. In connection with the siege of Metz, the Germans had to build a short railroad 23 miles long. All the assistance that an unlimited supply of men and money could provide was called on to push the work, and difficulties of construction were light, yet they were 50 days in getting the first train over that short line.

RAPID ENGINEERING WORK.—General Grant in his paper published in the November Century, describes the manner in which General Dodge, with 8000 men, repaired 102 miles of railroad in Tennessee and Alabama, and constructed 182 bridges, many of these over deep and wide chasms, and that all of this work was accomplished in 40 days.

USEFUL INFORMATION.

AN OIL ECONOMIZER.—An apparatus has been designed and patented by Messrs. Thornton and Tate, of Mount Vernon, Ind., which is designed particularly for the cleaning of oil which has been used upon machinery. Oil which heretofore has found its way to the coal pile on account of not being suitable for use again because of its condition, can, by the use of this apparatus, be made perfectly clean. The economizer is guaranteed to do the work of four gallons of oil, and at the same time only drawing one; in other words, one gallon can be used four times, and thus save three gallons out of four. This machine in actual service has cleaned the oil sixty times, the oil after each cleaning being again used, keeping the engine and machinery bearings smooth and cool, thus showing that neither dirt nor grit was left remaining in the oil. Consumers of oil are requested to investigate this matter closely, and reduce their heavy oil bills by using one of these machines. Among the advantages claimed are the following: It will keep the oil free from grit and dirt, saving a risk of heating or cutting the bearings. It will save expensive repairs, as oil can be used in large quantities without loss. It will separate any water that may accumulate in the drippings, from valves or piston rods, or other causes, leaving only the clean oil. In large establishments it will pay for itself in a year. No matter what kind of quality of oil is used, it will clean the drippings.

MINE EXPLOSIONS.—The investigations made by the Prussian Fire-damp Commission to ascertain the causes of explosions in mines show among other things, that many explosions attributed to firedamp, or outbursts of gas, are really due to the fine coal dust in mines. It appears that all kinds of dust are capable of exploding violently when ignited by such means as the electric spark, and that the explosion extends much further with coal dust than with firedamp. The experiments relative to this inflammability of coal dust are stated to have been devised as nearly as possible in accordance with the conditions prevailing in practice, and were carried on at the Koenig mine Neunkirchen, Sarrebruck. A gallery, or drift, driven from the surface, was chosen as the place for treating the dust, means being also provided for keeping the particles in a state of violent agitation by currents of air. To provoke ignition of the dust the electric spark was made use of, a means that is far from furnishing that volume of flame found by the French experimenters to be necessary to explode coal dust. The tests were many times repeated, more than two hundred times in all, explosions occurring in every case.

A REMARKABLE BOILER EXPLOSION was reported in the daily papers on the 15th inst., as having taken place at Harper's rolling mill, in Newport, Ky. The belting slipped from a large fly-wheel in the engine room, causing the wheel to explode, and a piece weighing nearly a ton struck two boilers near by, causing them to blow up, owing to the terrific force of the blow. Another piece of the wheel went up in the air and landed on the river bank a quarter of a mile distant. Fully one hundred men were in and around the mill at the time, and it seems miraculous that the casualties were so few, for only three persons were seriously hurt and only one fatally. The conclusion to be reached is that steam boilers are never safe, for even a non-explosive boiler would have hardly withstood so severe a blow without retorting in kind. A mule would not have stood such treatment without at least giving a parting kick.

CLEANING NEW RUBBER CORKS AND TUBING.—New rubber corks and tubing are always coated with more or less sulphur, and perhaps also some of the "filling" that is often added to them (which is often powdered soapstone). Mere washing in water will not remove this coating, especially from the inside of tubing. It is best gotten rid of by boiling the goods in a solution of one part of sulphide of sodium and two parts of caustic soda in 10 parts of water. The tubing should be lifted out of the liquid occasionally, and carefully reimmered, so that new liquid will pass throughout its bore. After having been thoroughly hoiled in this manner the goods are carefully washed in water. If the tubing is previously treated with warm water and thoroughly kneaded or beaten, to loosen the coating adhering to the inside, the above described cleansing process will be much more thorough.

TIN PLATES A MILE LONG.—"Tin plates a mile long" is rather a startling announcement, yet Sir Henry Bessemer hints that the means for producing such will be his next contribution to the science of practical metal working. His plans are not entirely made public, but in general they contemplate running the steel through the rolls and bringing it out plated with tin in sheets of any length, and then cut into plates of any desired size. The experiments are pronounced successful, and patents have been sought on the process.

POLISHED IRON JEWELRY.—What the old alchemist failed to do modern mechanics have accomplished, in effect at least. They have not exactly transmuted base metal into gold,

but they are making polished iron jewelry that is as attractive in appearance as gold filigree. The iron is highly polished and reflects light like a diamond.

LABOR IN THE NATIONAL CABINET.—There is talk of introducing a bill in the House of Representatives, creating a new department of government, to be known as the Department of Labor, the head of which shall be a Cabinet officer. A proposed feature is the requiring of sworn statements from employers, covering the wages paid by them and the profit realized on capital invested. It is possible that such a department might do useful work, but the clause requiring the disclosing of business affairs is too inquisitorial in its nature to be tolerated in this country. Employes as well as employers would object to officious meddling of this kind. This clause will have to be eliminated before there is any prospect of the passage of the bill.

GLASS FLOORING.—The substitution of glass flooring for boards continues to increase in Paris, this being especially the case in those business structures in which the cellars are used as offices. At the headquarters of the Credit Lyonnais, the whole of the ground is paved with large squares of roughened glass, imbedded in a strong iron frame, and in the cellars beneath there is sufficient light, even on dull days, to enable clerks to work without gas. The large central hall at the offices of the Comptoir d'Escompte has also been provided with this kind of flooring, and it is said that, although its prime cost is considerably greater than that of boards, glass is, in the long run, far cheaper, owing to its almost unlimited durability.

CEMENTING IRON RAILING TOPS.—A correspondent of the English Mechanic says that he used the following recipe with the greatest success for the cementing of iron railing tops, iron grating to stoves, etc., and with such effect as to resist the blows of a sledge hammer: Take equal parts of sulphur and white lead with about a sixth of borax; incorporate the three so as to form a homogeneous mass. When going to apply it, wet it with a strong sulphuric acid and place a thin layer of it between the two pieces of iron, which should then be pressed together. In five days it will be perfectly dry, all traces of the cement having vanished, and the iron will have the appearance of having been welded together.

A NEW style of paving block is composed of a hollow iron shell filled with any desired concrete, the shells being arched underneath, and for street paving are four inches wide and from ten to twelve inches long.

GOOD HEALTH.

A "House Epidemic" of Pneumonia.

Dr. Fr. Rudberg gives a brief account in the *Etica* of an epidemic of pneumonia occurring at the end of last year in a workmen's barrack at Sandarne, near Soderhamn, in Sweden, where there are five of these barracks, situated in a row, a distance of a couple of hundred feet from one another on a piece of sandy soil near a pine wood. The epidemic was confined to one of these barracks, there being only a single case in the remaining four at the same time, and very few in the surrounding districts. This building was constructed of wood, and had 16 rooms arranged in two stories, there being a common porch to every two rooms. Each room was occupied by a separate family. The total number of inhabitants was 78, of whom 47 were over 15 years, and 31 under that age.

The first case occurred on November 16th, in a boy of eight; subsequent cases occurred on November 27, and December 4, 7, 11, 14, 16, 19 and 20th. Of these there were four males and five females, one girl and one boy being under 10, but all the rest between 20 and 40. Six cases occurred in the lower story, and three in the upper. The disease appeared to have no tendency to pass from one room to the adjoining one, or even to another one on the same story, and in no case was more than one inmate of a room affected; but one woman living at a distance, who occasionally visited some of those who had the disease, was attacked by it herself on December 14th. It should be stated that there was plenty of intercommunication among the families. The writer does not mention any of the clinical characters of the epidemic.

HUMAN HAIR.—An expert has been figuring out some facts about the human hair. When the hair is pulled from the head it may be observed that the end which was implanted in the scalp is larger than the hair itself. This is the bulb or root from which the hair grows. A hair is, in fact, a delicate tube, round in straight haired persons and flattened in the curly-haired. It is the flatness of the hair which makes it curl. Women have coarser hair than men. The average number of hairs on the head is about 120,000. This calculation is based upon the ascertained fact that a square inch of the head of a person who has an average head of hair contains by actual count 1000 hairs approximately. In early days the kings of France used to pluck a single hair from the head and bestow it upon one of their attendants as a token of favor. The hair grows from eight

to ten inches a year. It has been found that it grows faster in summer than in winter. Light and sun evidently have an influence on the growth of the hair as on other vegetable products.

THE THIN YANKEE.—Americans incline to emaciation. A thin Yankee worries and asks what he shall do. First, be thankful you are not fat. Man's body is for use. Lean, flexible folks should be grateful that they do not waddle and wheeze. Besides, your chance for long life is better than a fat man's. But you need a certain quantity of fat, and I will prescribe for you. You probably eat too much, and hurt your digestion. It is not food swallowed, but food well digested that produces flesh. If your digestion is shaky, shun pie, cake, pudding, sweetmeats, all desserts, and confine yourself to beef and mutton, with graham bread, potatoes, and other vegetables, eating of plain food less than your usual quantity. Now, you must observe and eat more or less as your case may require. It is very important that you should masticate your food thoroughly. Live in the open air much, for after the food is dissolved in the stomach, it must mingle with much oxygen in the lungs before it becomes a part of your body. Bad food with pure air will make good flesh faster than good food with impure air. On rising and on going to bed slap your stomach and bowels hard several times with the flats of your hands. Shun tea. Sleep fattens, so retire early, and don't hurry up in the morning. Our friend, the waddler, ought to sleep little, you much. A good prescription for him is:

"Keep your eyes open and your mouth shut," while a good one for you is:
"Keep your mouth open and your eyes shut."
—Dio Lewis.

CLEAN HANDS.—According to the fearful experiments of Dr. Forster, of the *Medical Gazette*, there is no such thing as the possibility of clean hands on anybody. Washed with soap and water, with carbolic acid, with all and any of the disinfectants in common use, our hands will still remain scientifically unclean, that is to say, that a preparation called sterilized gelatine, absolutely destitute of living organisms on being touched by the fingers thus washed and supposed to be clean, immediately develops living organisms acquired from the fingers. But if the hands are washed in a dilute solution of chlorhydrate of mercury, or corrosive sublimate, one part to one thousand parts of water, perfect cleanliness is attained, and no living organisms will be developed by the touch of the fingers. It is pitiful to think that we are really so palpably made of the dust of the earth; but it seems that we must endure it, since corrosive sublimate can hardly be made the adjunct of our daily toilets, and if it were, then the next time we shook hands, or took up a hook, or went into the street, we should but develop a fresh crop of micro-organisms. The fact is that these discoveries of science show us, if they do nothing else, how fearfully and wonderfully we are made, and, if we regard them seriously, there is nothing we could eat and nothing we could do which would not make death seem to hang imminent in the air. There is one refuge for the unscientific, and that is in whistling the whole matter down the wind, keeping clean to the best of belief, and thus taking care of one's self, letting the micro-organisms take care of themselves.—Harper.

DEATH CAUSED BY EATING DIRT.—A death recently occurred at Portland, Maine, from eating dirt. The two-year-old daughter of John Shannon, a teamster, early in the summer began to eat earth, for which she developed an inordinate appetite. Neither punishment nor kindness nor threats could break her of the habit, and even when confined to the house she would escape mud from other children's shoes and eat it. Three weeks ago the parents began the strictest watch, and the child was permitted to eat only wholesome food. Her appetite was good, yet she began to grow thin and a sort of jaundice set in. The child grew weaker and weaker until the morning when she died. The parents would not permit a post mortem, but it is the opinion of the physicians that the dirt eaten by the child clogged the hilarity ducts, and that this produced death. Cases of dirt-eating are not uncommon among children, and whenever observed, medical advice should be sought, as the taste is produced by a diseased state of the system, and the habit is a dangerous one.

UNHEALTHFULNESS OF OIL STOVES.—It is not generally known that coal oil and gasoline stoves rapidly vitiate the air of a room for breathing purposes by the development of large quantities of carbonic dioxide. How much longer must this continue before manufacturers of such goods will obviate this new danger by inventing some form of hood and pipe for conveying this poisonous gas to the outside atmosphere? Volumes have been written concerning the ventilation of homes, and the injury that arises, especially to children and the infirm, from crowding too many people together in closed apartments, and now, with the introduction of oil and gasoline stoves in the household, a new difficulty presents itself which is not easily remedied in the endeavor to provide for health and comfort. These stoves are frequently found with several large burners in full blast, in small kitchens, hardly large enough to contain air to supply the healthful requirements of one person.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

CLEANUP.—Amador Ledger, Feb. 20: The last cleanup at the Gover mine was an improvement upon the preceding one. The 20-stamp mill disposed of from 35 to 40 tons a day. Sulphurets are still being hauled from the Amador Queen mill to the sulphurets works at Sutter Creek. When the work of hauling commenced there was several hundred tons of sulphurets on hand. They are largely mixed with sand, however. R. C. Downs has been in Volcano during the past week preparing for the starting up of the Downs mine early in the spring. At the Kennedy the water has been reduced below the 700 foot level, leaving only 100 feet of water to be taken out. It is thought that two weeks more work will reach the bottom of the shaft, which is over 800 feet deep. The ten-stamp mill of the Potosi was started two weeks ago by Jos. Carrara, on rock from the North California tunnel. We are informed that, judging from indications, the yield is likely to be very gratifying. The new-fangled concentrator at the Moore mine is not a success. It is to be pitched out, and buddles substituted in its place.

WEST POINT NOTES.—It might not be amiss to mention a few facts regarding this district. It is situated about a mile from the Amador county line, at an elevation of 2,500 feet above the sea. The extremes of climate here are not of sufficient severity to interfere with mining operations during the winter season. We are located in the timber belt, hence we are amply supplied with wood and lumber, which greatly facilitates mining and curtails expenses. The extent of the mineral is five miles in width by the same in length. A portion extends into Amador county, where may be found some valuable ledges, from which many thousands have been extracted. Perhaps two hundred mines have been found here but out of all of these there are about five that can be made to pay dividends with proper management. The principal mine is the Consolidated Lone Star & Reed and Hillary, but owing to partnership complications it is laying idle at present. There are 1,000 tons of second-class ore on the dump, that will average \$10 per ton, and a series of chutes from 50 to 100 feet in length and from 1 foot to 25 feet in width, every portion of the workings are in plain sight and open to inspection. Every ton of ore in the Lone Star mountain will probably pay \$10 per ton by milling.

SUTTER CREEK.—Amador Ledger, Feb. 20: Teams have commenced in earnest hauling wood to the Mahoney mine. There are three teams hauling steadily, and if the weather continues fine for a few days longer there will be enough wood on the ground to make it safe for them to commence taking out water. There is an immense amount of water to be taken out, as both the Lincoln and the Wildman have to be drained to a considerable depth. In all probability it will take at least a couple of months to get to the bottom of the shaft. R. B. Symington, a gentleman from San Francisco, who has been appointed to look after the Amador Consolidated mine, came up on that mission last week. He remained only a day or two. He expects to make frequent visits here in the interest of the company. Teams are busily engaged hauling wood to this mine also.

Calaveras.

GRAVEL.—Mt. Echo, Feb. 20: The celebrated gravel mine, situated at Monarchville, about three miles northeast of this town, and known as the Jack Rabbit mine, is yielding large quantities of the precious metal. The shaft is about one hundred feet deep, and the pay gravel is six or seven feet in depth. Numerous quartz localities have been made in the neighborhood of Angels recently, and prospecting is going on vigorously on all sides. A quartz "boom" in the spring is inevitable. Success to the energetic and ambitious prospector. It is currently reported and generally believed that the Lindsay mine has been sold to London capitalists for a large sum of money. This mine is situated about one-half mile west of Angels, and was discovered twenty odd years ago. Several immensely rich deposits have been extracted from it within the past fifteen years. It has heretofore been believed that it was only what is generally termed a pocket mine, but recent developments have demonstrated the fact that the mine contains a large body of good milling ore.

El Dorado.

THE HERMITAGE.—Placerville Republican, Feb. 20: The Hermitage mine, better known as the old Sugar Loaf mine, near Nashville, is being informed by reliable mining men, to be started up soon. The mine once the property of Mason & Ryan, is now in the hands of Dr. Smith of Plymouth. Work on the mine is necessarily delayed pending final arrangements regarding the purchase of the property. When these matters are fixed, as no doubt they will be in a short time, the mine will be started up again, and the erection of a mill commenced at once.

TEST OF ORE.—Georgetown Gazette, Feb. 20: Dr. Spencer is busy making a test of a lot of ore in the Eureka null of this place, taken from his mine within half a mile of the mill, just east of town. Sanford Hansen is assisting the doctor and his boys in the null, and judging from the quantity of amalgam piling up on the plates, the ore is turning out well. In fact, so encouraging is the apparent result, that new locations are being made on the lode.

PYRAMID MINE.—We have information from a perfectly reliable source that there is a good prospect for the Pyramid mine being started up soon. The mine has been idle for a long number of years, much to the detriment of the owners and the country. It is now bonded to a wealthy mining syndicate of Glasgow, Scotland, for \$30,000. The terms of the bond are that if the ore runs \$3.75 per ton, \$30,000 will be paid for the mine, and for every dollar over \$4 per ton that the ore runs, \$5000 additional will be paid. It is also the intention of the purchasing company, in case the run turns out satisfactory, to immediately commence the construction of a 40-stamp mill together with works for the reduction of sulphurets, with which the ore is rich. The ore is of low grade, but of immense body, and a large num-

ber of stamps can be run to advantage. It is situated at the junction of the Coloma with the Folsom road, about one mile this side of Gray's Flat, in a good mining locality. It is one of those mines which will do for permanent investment, with sure and regular dividends. There are many such in El Dorado county, and the sooner they are developed and disposed of to those having the capital to properly operate them the better for the county.

Mono.

BENTON NOTES.—Inyo Register, Feb. 18: The favorable opening of the mining outlook for the chlorides on Blind Springs Hill for 1886, continues to improve, and there is every indication that the production of ore will be materially increased over that of 1885, but it may be as well to avoid unnecessary prophesying, until results speak for themselves. A great deal of steady and persistent prospecting and mining has been going on during the winter months, and though every one cannot be successful, the prosperity of a few always helps out and gives renewed confidence to others. W. H. Russell intends starting up the Montgomery mill this week, and W. J. Hosking has gone up to put things in order for another run.

Monterey.

AN EXCITEMENT.—Salinas Index, Feb. 20: Profound excitement prevails amongst a certain few of the citizens here in Soledad over their alleged discovery of gold and silver in vast quantities. The mine seems to have been discovered by a Mr. Melville, a resident of this town, who has divided his attention for several years past between farming and mining, or rather prospecting, his mining of late being the partial development of a copper mine over beyond but near the Palisades, and at the same time keeping his eyes peeled for gold or silver. The date of this last and wonderful find we don't know. It is located up the gulch which starts near Carnahan's ranch house some three miles to the east of Chalona Flat, and runs right back to the hills. It is reported that a strip of country four miles in length has the same gold-bearing appearance. Specimens of the silver ore have been displayed around town but some experienced miners who live here state the ore does not have the same color they supposed silver ore always bore, but brighter. A mining company has been formed and a young man by the name of F. D. Wood elected recorder of the district. This excitement revives instances of long ago of some prospecting done in the same locality. Outside of the few who represent the company the people have no faith in this great ado and pass it by as a bubble.

NEW GOLD MINES.—Cor. Monterey Democrat, Feb. 20: I have prospected Monterey county for the last 12 years for mines and most of my labor has been spent in the old Chalone mining district and at last I have struck a ledge. The top croppings show for three miles, and the ledge is seven feet wide and assays show from top rock \$7.44 per ton, gold and silver. I have sunk five feet on the ledge and have taken out some very rich rock. To-day we organize a mining district at the residence of Mr. Thos. Nixon, to make laws and elect a recorder. We have laid out a township to be known as Silver City, but these mines are to be known as the Black Ruby Ledge, situated six miles southeast of Soledad.

Placer.

MINING AT TODD'S VALLEY.—Argus, Feb. 18: There is not much doing in the way of mining at Todd's Valley at present. Most of the claims are lying idle, principally, we believe, on account of the litigation between C. T. Wheeler et al., of Sacramento, against Chas. Constable, assignee of the estate of the late A. A. Pond. The only mine of any note now operating is that known as the Mountain Tunnel, located on the old Todd place. Twelve or 14 men are employed there sinking a shaft, which is down 25 or 30 feet below the level of the main tunnel. This shaft is partly for the purpose of supplying better ventilation, partly to convey the water wherewith to run the machinery of the mine. The owners are San Francisco men. Ernest Garbey is the superintendent.

Shasta.

DEADWOOD.—Shasta Co. Democrat, Feb. 17: With the advancing spring the outlook for Deadwood for the coming season is exceedingly bright. The mild and open winter has not materially hindered prospecting. The Brown Bear mill has been shut down for the past few days for much-needed repairs, and will be ready to start in a few days. The mill has recently changed working hands, with two competent men at the throttle. There is an abundance of rich ore on the dump and plenty of the same kind in sight in the mine. The shipment of bullion for the coming season would no doubt make many a road-agent not hesitate to face the messenger's trusty shotgun. John Gibson has his arastras running on Blagrove's ore which yields a handsome profit. George Chenoweth has leased the Brown Bear mine from the Gibson Bros. If there is any pay rock in the mine George will find it. John Yule and Alec Campbell recently struck it rich in the Monte Cristo mine, leased from the Brown Bros. The Van Matre boys are also taking out good ore from their claims. Tom Greene and Balleau are prospecting on a ledge which shows up plenty of good ore. The Trinity Mining Co. has its mill and mine shut down for a few days. Franck & McDonald Bros. keep their mill running steady on good ore. The company intends running a long tunnel in the spring to tap their mine several hundred feet deeper, and perhaps put an addition of five more stamps the coming summer.

A WORKED OUT MINE.—Shasta Courier, Feb. 20: The old and well known Washington mine at French Gulch had, like a number of others, its ups and downs. Men who called themselves mining experts, but who were not, and others who wanted to gobble up this valuable property for a mere nominal figure, were free in pronouncing the mine worked out. But the owners had not lost faith in it, and persevered in spite of all reverses and drawbacks. A few months ago an experienced miner, Robert Stanley, took a lease of a portion of the mine, and in a short time he, with the aid of two more men, developed an astonishingly rich deposit of gold-bearing quartz. Last Thursday Mr. Stanley brought to the office of E. Lewin here, the result of 29 tons crushing, 103 ounces of retorted gold and a great number of specimens literally covered with free gold and gold-bearing sulphurets. He has ten tons more of this ore out, ready for the mill, and about twenty tons that he calls second class ore, and enough in

sight to make several more such runs before his lease expires. The ledge itself, showing well all along, is not touched, and this ore was merely taken from stringers leading to it, and found, in a substantial working tunnel, now in 100 feet, for the future development of the mine, which gives promise to become quite a bonanza for the owners and the lessee. All French Gulch rejoices over this streak of good luck to the Washington boys, and so do we.

Sierra.

A PROSPEROUS OUTLOOK.—Sierra Tribune, Feb. 20: George Abbe visited his quartz mine up Ladies' Canyon last Wednesday, and found that in each day's progress softer rock is encountered. He believes that it is now only a matter of a month or so when the ledge will be reached. Mr. Abbe and his associates have expended quite a large sum of money in the development of this claim, and they deserve success. There is but little doubt that the ledge they are running for will prove remunerative as the surface indications all point that way. Mr. Abbe says that some very rich specimens have been found at various times in the croppings. Lately a San Francisco party secured an interest in the mine. He is said to be very wealthy, and consequently abundantly able to bear his share of expense. It would not be surprising if the inspiring sound of the quartz mill was heard in this quarter by the time another winter shall have rolled around.

PORT WINE.—Cor. Mt. Messenger, Feb. 20: Most all of the miners are busy, while they have water to run their mines with, which, I fear, will not be but a short time, as it is failing very rapidly. Moor's claim at Bunker Hill has taken advantage of the water season, and stripped considerable ground which looks very favorable. The next we come to is Liberty & Co., who are busily engaged with a small force of men. The next mine is Jas. Lewis & Co., who are working the school house ground, and have moved the building on the upper side of the road opposite to where it formerly stood. The Pilgrim Co., at American Hill, have struck the lower part of their ledge; 17 feet wide. It prospects well.

GOOD INDICATIONS.—The ledge which was recently struck in the Perry mine is widening and judging by a sample piece of the quartz shown us this week, the owners have cause to rejoice at the results already obtained. It is not unlikely that some kind of a stamp mill will be erected at the mine next summer. Many men believe that the Perry is a continuation of the Sierra Buttes lead. If this should prove true it would be a grand thing for Sierra City, as the mine is located within a stone's throw of the business center of the town.

INCREASED PROFIT.—According to all reports the erection of the chlorination works at the Sierra Buttes mine has proven a very profitable investment. It is said that the output of the mine has increased several thousand dollars per month since the process of saving and working the sulphurets was introduced. Previously the tailing from the mills were sold to parties who worked them by arastras and realized large profits, the company thus sustaining a direct loss.

FOREST CITY.—Forest City is a flourishing mining camp, and will probably continue to be for many years. The Ruby and the Bald Mountain Extension mines are doing well, and those, together with the Bald Mountain, give employment to many men. Business there is fairly good, and the people are contented and happy.

NOTES.—Charles Thompson has bonded his claim, located a couple of miles up the creek from Bassett's, to Watt Hughes for \$6,000, the bond to expire the 1st of June. Sam Hartley the other day picked up a seven-ounce gold nugget in his mining claim below town.

Siskiyou.

THE SUMMERVILLE HYDRAULIC.—Yreka Union, Feb. 18: The Summerville hydraulic mine in South Fork of Salmon district, owned by Messrs. Geo. Smith, R. H. Campbell and Geo. C. Spooner, is one of the most extensive and best equipped in Siskiyou county. The company last year constructed a four-mile ditch at an enormous expense, and are now so situated as to be favored with an inexhaustible supply of water the year round. They own their own sawmill and store, and employ a large force of men. They are now in a fair way of receiving their reward for their energy and enterprise. The cleanup for January amounted to \$6000, Mint figures, and the outlook for this month is fully as good, but March will be better, as the weather will be more favorable. The company own more ground than can be worked in the next twenty years, and as far as can be ascertained from careful prospecting the gold is distributed uniformly throughout the entire claim.

Trinity.

DEADWOOD.—Cor. Trinity Journal, Feb. 20: Deadwood with its arastras, mills, mines, monuments and towers is still here. Active prospecting is now being done, and most all of the old prospects undergoing development are proving extensive and valuable. Francis Balleau has one of the most promising ledges in the district. Quartz is being taken out in abundance, in which can be seen free gold diffused in large quantities through the rock. The ledge averages three feet between walls and consists of the solid quartz itself. A mill will be erected on the mine early in the spring. Van Matre Bros. are at present doing their share at development to Deadwood by pushing their mine actively ahead with prospects never more exciting. Messrs. Lamb, Hopkins & Co. have struck their lode in their tunnel which looks to be in a prosperous condition. Jeff Brown & Co. on Thorn Gulch (a fork of Deadwood) has employed a few more men in their mine and will hereafter run two shifts. All the older mines are in blooming circumstances and keep well up in the old time standard.

Tudumne.

SUMMERVILLE NOTES.—Tudumne Independent, Feb. 20: The Louisiana mine will start up in the near future. This is a good mine, but unfortunately it has always been poorly managed. We hope that under the new administration it may prosper and become one of the leading mines in the county. Clark and Brown have commenced the erection of a quartz mill, at a point about half-way between Cherokee and Summerville. Steam power will be employed to run the mill, and it will contain sufficient stamps to crush ore extracted from a four-foot vein. Mr. P. Easton is constructing hoisting works on his mine at Arastraville. We are informed that his mine is looking well. We wish our aged friend

all the gains and none of the losses to which quartz miners are at times subjected.

NEVADA.

Washoe District.

CHOLLAR.—Virginia Enterprise, Feb. 20: The main lateral drift south on the 3100 level of the Chollar mine having been put in complete order throughout, with covered drain boxes to carry off all the water encountered, drifting south was resumed day before yesterday. It will be remembered that when this drift was stopped, about a month ago, its face was within a few feet of the Potosi north line, where quite a strong flow of water was encountered. The drain boxes carry this to the Combination shaft, where the Cornish pump lifts it to the Suto tunnel, consequently unless a very much increased flow of water is encountered this drift will now be pushed onward through the Potosi ground, a distance of 700 feet, to the Baulion ground. When this is done the natural result will be the sinking of the Ward, or Baulion Combination shaft 700 feet deeper to the required level to meet and connect with this drift, forming a very desirable and much-needed connection for ventilation and development purposes. This drift has been run thus far in the footwall of the ledge—on the west side—and the ground being of a favorable nature excellent progress is being made. The face of the drift is passing the line into Potosi ground and developments in that direction will be watched with eager interest, for it will pass into and through a large block of virgin ground—unexplored territory—in which there is plenty of room for as large bonanzas as those of Crown Point and Consolidated Virginia.

CON. CALIFORNIA AND VIRGINIA.—About 400 tons is now the daily yield of this mine, which is reduced at the Morgan and Eureka mills on Carson river. The average assays given from the mill batteries is between \$14 and \$15 per ton. About \$40,000 worth of bullion was shipped to San Francisco last evening. The main drift west from the C. and C. shaft into the 1950 level has been put in thorough repair with a view to practical explorations in that section. On the 1650 level the drift northwest is in 60 feet and steadily being advanced. On the 1400 level the exploration drift has been changed to a southwest course and was advanced over 60 feet during the past week.

HALE AND NORCROSS.—The deep winze below the 3000 level has reached a point over 20 feet below the 3200 level, and is still being continued downward, the ground being dry and very favorable. Orders will probably be received to-day, or very soon, to discontinue sinking, and open a station on the 3200 level for a lateral drift south to connect with the Combination shaft, which has been sunk to that level, or north to explore and develop the rich prospects obtained to the northeast near the Savage line. A few men have been employed during the last week or two in the upraise, above the head of the deep winze on the 3000 level, extracting some very good ore. This upraise is to be continued to the 2900 level.

OPHIR.—The west drift from the old Mexican shaft, on the 300 level, has been extended 33 feet, making a total length of 185 feet. On the 400 level the north lateral drift from the west drift from the old Mexican shaft has been retimbered and put in good working order. A west crosscut from this drift was started a few days ago, and is now in 48 feet, showing favorable-looking vein matter with streaks and bunches of low grade ore. On the 700 level the joint Mexican and Union drift being run in connection with this mine, and running northwest through the Ophir ground, is in 36 feet having been extended 39 feet during the past week.

GOULD AND CURRY.—Draining the Osbiston shaft of this mine and the Best and Belcher is steadily progressing. The pumps work well and the water is reduced nearly to the 2100 level. Unless something unfavorable should occur they expect to connect with the third line of pumps at that point about the first of March. As the water gets more lowered, progress is necessarily slower, owing to the greater extent and depth of water belt to be drained. The work is being very actively and efficiently prosecuted.

YELLOW JACKET.—Daily yield 115 tons from the old upper levels, which is reduced at the Brunswick mill. Judicious exploration work is being carried forward in various parts of the mine with a view to future production. The old ore breasts and stopes however, continue yielding well, although the ore is of a very unremuneratively low grade.

CROWN POINT AND BELCHER.—The daily output of ore continues to be about 350 tons, a large proportion of which comes from the 1600 and 1700 levels. Some very good stopes of ore are being worked between those levels and above, which yield better under the stamps than the low-grade ore from the old upper workings.

SIERRA NEVADA.—The main north lateral drift on the 520 level is now in 1819 feet, 62 having been added during the week. Material, dry vein porphyry with very little quartz or clay.

ALTA.—The lateral drift north towards the Berton ground continues its good rate of progress, also its favorable developments of low-grade ore stringers.

UNION CONSOLIDATED.—Lateral drift No. 2 north has been extended 43 feet, making a total of 123 feet. Material, vein porphyry, clay and a little decomposed quartz.

MEXICAN.—The explorations on the 500 level are actively continued in promising vein matter.

KENTUCK.—Enough ore is being extracted to keep the Rock Point mill supplied.

Bell District.

ORE.—Belmont Courier, Feb. 18: Ernst & Esser will soon make a shipment of ore from their mines in Bell district; as work progresses the property continues to increase in value and the owners are well satisfied with the results as far as they have gone.

Clark District.

NEW DISCOVERIES.—Eureka Sentinel, Feb. 20: Charley Burlingame came in yesterday morning from Clark mining district, where new discoveries of a promising character were made some ten days ago. The recent finds are about 13 miles west of town, near Nickals' ranch, and are about six miles north of the old Spring Valley district that created considerable talk and excitement several years ago. Mr. Burlingame brought in with him a number of sam-

ples of ore that he took out of the shaft of one of his properties from the surface down to a depth of six feet. All of them are of a promising character, and two or three will, no doubt, assay well. The formation is limestone and quartz carrying galena. He says half a dozen or ten men are there hard at work, and already a large number of claims have been located. He expects to return in a few days.

Columbus District.

HOLMES.—Candlemas True Future, Feb. 20: We are getting the stope above the 5th well started and it looks well and we think it will be just as productive as at any point below. In places it is very large and the ore is good milling. It is a very large body of ore, and there is but little doubt that it will go to the surface. We are working in the McCuen ledge, near the old 7th, where we have a streak of ore that is 18 inches wide. It is 40 feet long, looks well and assays well. The stope 60 feet below the Morris drift looks just the same. It is 170 feet long and will average fully 4½ feet wide. The ore is good milling and all goes to the mill as it comes down. There are places in this stope where the ore is 15 feet wide. This is as large a body of ore as was ever worked in this mine. This ledge is north of and parallel with the east and west ore bodies that have been worked near the foot wall, and no work has ever been done in it except what has been done by the Holmes Co. The ore bodies worked in the mine have generally extended to great depths. This one has been worked in from 20 feet above the 5th down to the 8th level. We have been running a drift from main level to cut this ore body and during the past week we cut what we think is the west end of the Morris ore body on this level. We cut it 50 feet further west than we expected to, the ore and the ground it is in looks exactly like the Morris ground and ledge. If it proves to be the Morris it will be larger on the 10th than it is on the 8th, in which case it will be a larger ore body than any ever worked in the mine.

GENERAL GRANT.—Work on this claim is progressing favorably. Mr. Dunlap has the chamber cut out on the ledge in the tunnel and is sinking as fast as possible. The ore improves as he goes down.

GOOD WEATHER.—The boys are taking advantage of the fine weather. There are about 30 of them working on their own claims, and some of them have very fine prospects.

SILVER BOY.—Several parties have visited the mine of late with a view of purchasing. There are several fine specimens to be seen at this office.

Eureka District.

THE OUTLOOK.—Eureka Sentinel, Feb. 17: The Sentinel believes a better era will shortly dawn on Eureka. Preliminary steps have been taken for the inauguration of work which will materially aid in determining the value of many of the principal mines of the district below water level. While most of these properties immediately about us are what might be termed "virgin," the two—and the only two that have been worked systematically and energetically, namely, the Eureka Con. and Richmond—have no doubt yielded up the bulk of their wealth that existed above the flooded levels. The amounts that each of these properties have, disbursed to stockholders are up in the millions, and most of those who profited by this wealth, especially that produced by the Eureka Con., still hold to their property with the faith and zeal of those who are slow to let go of a good friend. The preliminary work to which we refer was decided on the other day by the Eureka Con. Company. A contract was let by them for a 20x60 direct-acting hoisting engine, similar to ones successfully in use on the Comstock, and having a hoisting capacity of at least 200 gallons per minute. It has yet to be constructed, but from what we have been able to learn, it must be ready for delivery within 90 days. Just as soon as it is placed in position, the work of draining the mine and sinking the shaft to a greater depth will be commenced. Many of us know what the Eureka Con.'s upper levels have demonstrated, and we know, too, a like formation exists in probably 20 of the 50 or 60 producing properties of the district. What there is below the water levels of these properties is a matter of some conjecture. That when shown, will, in no small degree, decide the permanency of the town. Firmly believing that it will result in the unearthing of large bodies of ore of a valuable character, the Sentinel hails the projected work with joy, knowing that it will, locally, be a common good. Until the desired result is known we have the knowledge that among those acquainted with the ground, and who are well versed in mining, especially in limestone formations, the theory and belief is common that the principal wealth of Ruby Hill and Prospect Mountain especially can be obtained only by such operations at depth as have just been inaugurated.

Esmeralda District.

AURORA.—Virginia Enterprise, Feb. 19: The Aurora boom seems to have moderated considerably, only about two dozen men being employed there at present. Many who rushed thither on the strength of the story that the mines had been sold to an English syndicate of heavy capitalists who intended working them for all they were worth, are getting out of there again. The Blasdel group of mines are merely bonded to the parties in question, who will purchase in case the returns of a few tons of ore now being extracted for shipment to London should prove satisfactory.

Jackson District.

MEN AT WORK.—Silver State, Feb. 20: There are some 35 or 40 men at work in the district, and the prospects are that the population will be quadrupled in a few months. The mill is rapidly approaching completion, and as there is no doubt of the permanency of the camp the miners think they should have a weekly mail.

ARIZONA.

TOMBSTONE.—Democrat, Feb. 20: Since the water-level was reached in the mines of Tombstone, more than two years ago, the bullion output of the district has been materially lessened and a feeling of uncertainty and suspense has prevailed among the property-owners of the camp. Reaching the water-level is always regarded as an important epoch in the history of any mining camp. The character and grade of the ore often changes at that point, and not infrequently the productiveness of the ledge disappears altogether when the water-level is passed; and then at times the volume of water encountered proves too great to be controlled by all the appli-

ces of modern mining machinery. Hence, it is not surprising that the feeling of insecurity or lack of confidence before referred to should prevail in Tombstone pending a solution of these important questions. But the Democrat, confidently asserts that the crucial test from which the camp is just emerging has been prolific in satisfactory results. Previous to the breaking of the Grand Central pump-rod in December last, it had been conclusively demonstrated that the water was easily controlled by the machinery now in place at the mines. The continuity and increased richness of the ore bodies below water level was also proven. These questions so vital to the prosperity of the camp having been satisfactorily settled, an era of greatly increased activity in mining matters may be confidently anticipated. Outside mining operators are regaining confidence, and as a result the ensuing season will witness the expenditure of many thousands of dollars in the development of claims that have long remained untouched. Appended is a partial resume of present operations in the district.

TOMBSTONE MILL AND MINING CO.—This company is perhaps doing more work at present than any other company in the camp. The Girard mill is pounding away night and day, at the rate of 2000 tons per month. Most of this ore is being taken from the old reliable Toughnut, although work is being done on the East Side, West Side, Lucky Cuss, Luck Sure and half a dozen other claims owned by the company. The concentrator and smelter at Charleston are still working the tailings beds at that place. Superintendent Cheyney informed the reporter that he could easily furnish ore from the several claims being worked to run three times the number of stamps in the Girard mill. Including those at Charleston, the company employs 180 men.

STATE OF MAINE.—This property, situated about half a mile west of the Randolph, is owned by Charles Leach. It has been worked continuously for more than four years, and during that time a vast amount of work has been done. The main incline is down 520 feet, at which point water was reached and further sinking prevented. Twenty-five men are at present employed, and 40 tons of ore are shipped monthly to Pueblo. The fact that these shipments pay the entire running expenses of the mine gives some idea of the richness of the ore. The 3 N., an adjoining claim, also owned by Mr. Leach, is being worked and considerable rich ore extracted. The main shaft is down over 100 feet.

LEASED.—Mohave Co. Miner, Feb. 12: Tom Steen has leased the old Mayflower mine on the hill opposite the Miner office, and will very shortly go to work on it. Some very good ore has been taken out of this mine in former days, and Tom is hopeful of finding some more of the same kind. Thomas Roberts returned from Kingman on Monday, where he had been to dispose of a load of ore from the Retort mine. His ore sampled 538 ounces in silver, and nearly two ounces of gold per ton. This is what might be termed a very fair grade of ore, but we have plenty of this kind in Mohave county. Ed. Thompson has bought out the interest of Ed. Cook in the Golconda mine, near Todd Basin.

GRAND CENTRAL.—The new pump-rods arrived this week. The work of putting them in place has not yet been begun, owing to the non-arrival of the steel coupling plates. Foreman Leach informed the reporter that within 30 days after the arrival of the plates the pump will once more be in operation. The pumps have been closed down nearly two months, and the water in the mine lacks 23 feet of having regained its original level. For the past three weeks it has raised at the rate of 14 inches per week. Forty tons of good milling ore, from above the 400 level, are being raised and sent to the company's mill daily.

PROMPTER.—The tedious litigation which has been in progress over this property for a year and a half has been happily settled, the Chicago stockholders having obtained complete control. Superintendent W. H. Ferry informs the Democrat that it is the intention of the company to thoroughly prospect the property. Seven men are now at work, and others will be put on as soon as their services can be utilized. When the most favorable point for sinking has been decided upon, a new shaft will be begun and continued down indefinitely, or as long as there is a reasonable prospect of striking an ore body.

EMERALD.—Since this mine became the property of the Grand Central Company, not less than \$100,000 has been expended in development work. The main shaft is down a short distance below the 600 level. They are drifting both ways on the ledge from the 600 level, and have two feet of 40 ounce ore. Drifts from the 500 level are also in good ore. The daily output of ore has in the past been 20 tons.

LITTLE GIANT.—This promising property, situated about half a mile southwest of the Emerald, is owned by Judge J. S. Robinson. Main shaft is down 160 feet, the bottom of which is in good ore. The ore is sorted and the richest shipped to Pueblo. The lowest return yet received was 220 ounces to the ton. Seven men are at present employed.

THE CHLORIDERS.—Doc Ryder and J. C. Swayzee have secured a lease on some ground belonging to the Rattlesnake. They are taking out some very rich ore, and will soon make a shipment. The chloriders in the vicinity of the Merrimac are gathering in some rock which will go up in the hundreds.

COLORADO.

GEORGETOWN NOTES.—Courier, Feb. 18: Bonqvist & Co., lessees on the Bullion lode, East Argentine, made a shipment of ore from their workings this week. The board of managers of the Colorado United Mining Company contemplate disposing of some of their mining property. Wm. H. Butler, who is working the Muscovite lode on Democrat mountain, shipped about three tons of heavy galena ore a few days ago. C. T. Gleason, lessee on the Independence lode, had a millrun of 3930 pounds of ore last Tuesday, which yielded 217 ozs. silver to the ton in one class. Peterson & Co., lessees on the Johnson lode, East Argentine district, made a shipment this week of about a ton and a half of ore, which milled about \$100 to the ton. Martin Kapsch & Co., lessees on the Colorado mine, have a vein of mineralized quartz ranging from four to six inches in thickness. Cook & Co., lessees on the Maine mine, had a \$1500 millrun last Saturday. The first class returned 354 ounces silver and 50 per cent lead, and the second class 120 ounces silver per ton. Partic-

ularly interested in the Pulaski mine are contemplating renting the Silver Plume mill, which will be used in concentrating ores from that mine. Immense bodies of concentrating material are exposed. A shipment of about ten tons of ore was made from the Centennial mine this week. Drifting and stoping is progressing on this lode. A two-foot vein of lead ore is opened on the 50-foot level, and four feet of iron pyrites are shown on the 100-foot level. The working lode on Brown mountain, near the 7-30 mine, is being worked under lease by Stanley, Ryan & Co. The developments show a shaft 40 feet deep, from which a drift has been run in a westerly direction 100 feet, and is still being pushed ahead. The breasts shows a vein of solid ore from three to four inches in thickness, while in the shaft, which is still being sunk, is exposed nearly two inches of ore, which returns \$173 to the ton, according to the last mill-run.

UTE CREEK.—The 100-foot level east on the Argosia is being driven ahead on mineral which mills about \$200 in gold and silver. The Bald Eagle is being worked by several sets of lessees with good results. The Argosia is being worked by Depeu & Co., under bond and lease. The main shaft, which is down about 60 feet, is being sunk on six inches of solid ore, which mills from \$200 to \$400 a ton in gold and silver. An engine and hoisting rig has been purchased, and will soon be placed in position. A tunnel is being driven to open up the Mattoon lode, which is in 100 feet and near the point of intersection.

IDAHO.

OWYHEE.—Silver City Avalanche, Feb. 16: The War Eagle mill whistles blew on Monday, the stream was turned into the cylinder, the wheels moved and the stamps commenced dropping on Potosi ore. Everything worked to a charm, and Mr. McGregor was there to see that it did. Mr. Keyes is the amalgamator, and is said to understand his business, having had great experience in Nevada in milling the ores peculiar to the mines of that State. There were a hundred tons of ore to run through from the Potosi, and it is expected that as much more will be hauled from the Black Jack. Mr. Mr. C. D. Peck has struck a very rich chimney of ore on the Oso. The body pitches south into War Eagle mountain and was found in running the drift south. The lode is well situated for working and good backs can be had by continuing the drift on the lode. The raise being made in the Little Giant and the drift now going north on it are in splendid ore, which carries gold visible to the naked eye. The distance from where the crosscut struck the lode to the surface is 160 feet. The drift will be continued north and the lode properly opened for extracting ore. That now being extracted is sacked. The lessees of the Empire lode have struck a rich body of ore in the third level of that mine. It carries both gold and silver, but gold predominates. It is where the rich stringer worked by the Terrill Brothers several years ago comes into the main lode. It is not known how extensive the ore body is, but so far as it has been run on it shows up splendidly and will turn out well when it is milled. We understand that Mr. Simon Harris and Frank Nichols have encountered a very rich chute of ore in the Minnesota and Chariot mine. The ore now being extracted is covered with gold and silver.

MONTANA.

DRUM-LUMMON.—Inter-Mountain, Feb. 17: The mine is opened by two tunnels. The upper one is about 230 feet long and connects with a shaft on the vein, 100 feet deep, from the bottom of which levels have been driven each way along the ledge, and most of the ore above them has been stoped out. The greater part of this work was done by Mr. Cruise, the original owner of the mine, before it was sold to the Montana company (limited) of London. The ore at this point reached a width of 60 feet. The company went lower down the mountain, and ran a tunnel called the Maskeline which cut the vein at a depth of 450 feet, from which levels have been run. The two tunnels have been connected by "raising" on the vein, and two levels have been run southwest above the lower levels. The main drift from the Maskeline tunnel running southwest, first passed through a chute of ore on the hanging wall 120 feet long, and the same ore chimney was found in the upper levels. The pay streak is from 4 to 12 feet wide, and mills about 50 per ton in gold and silver. Some stoping has been done above the lower level, but fully two-thirds of the ore between that and the upper tunnel remains standing. Next came 250 feet of nearly barren ground, which was followed by another ore chute that in parts shows a width of 30 feet. It is free milling, and yields \$33½ gold per ton. All the upper levels are in this pocket at present and one of them has been in ore for over 100 feet. On the northeast side of the tunnel a barren streak about 120 feet long was first encountered; then a chute of ore of about the same length, consisting of milling and shipping ore; the former carrying from 50 to 150 ounces per ton, and the latter 300 ounces and upwards. They have stoped a little on this chimney. Northeast of this was another barren zone, 150 feet long, followed by about 100 feet of the best ore they have yet found in the mine. The shipping ore contained by earload lots from \$350 to \$540 per ton in gold and silver, and the milling ore yields from \$700 to \$750. The level next passed through 25 feet of poor ground; but the heading is now in another mass of ore, nearly 100 feet wide. The last ore chute contains a great deal of silver chloride, and is the freest ore yet met with, yielding up yards of 100 ounces per ton.

NEW MEXICO.

SOCORRO DISTRICT.—Socorro Bulletin, Feb. 20: The average assay value of the Morning Star ore body in the 118 foot shaft, amounts to 55 oz. silver and \$3 gold. The Torrence is working steadily and the mineral is being dumped with a view to treatment at the M. & M. Co.'s mill and the Billing works in this city. Messrs. Purdy and Bennett, now in the city from Pierce City, Mo., are prominent members of the Dempster Mining Company, operating in the Black Range, which owns the German, Green Cap, James Henry and Hancock claims, all of which have dumps of pay ore, and the company have decided in the near future, after carefully weighing the question, to erect a concentrating plant in that range. Our reporter visited the Graphic M. & S. Co.'s plant of this city on Tuesday, and ascer-

tained that the ore under treatment is still drawn mostly from the Greyhound and Graphic mines of the Magdalena district. One stack is in continuous operation, and the other will blow in to-morrow.

WATER CANYON DISTRICT.—Maher & Dahl are actively engaged in mining operations on their important properties. Col. Wm. Roy and H. May have completed their assessments for the present year on the Logan claim, and they have an important body of quartz-bearing gold, silver and galena. Assessment work for 1886 has been completed on the Annie Z., and Mr. Ziegler, the owner, has succeeded in intersecting a small, continuous, but exceedingly high-grade argentiferous copper vein. Haase, Ott & Co. notified the owners of the Jane Bowman that they wish to continue their lease for another year, and state that they are preparing to erect a large concentrator plant in Water canyon. Steady work continues to be the order of the day in the tunnels and open cuts of the Stem Winder, of which Martin Joyce is the owner. The ore afforded by this property consists of argentiferous galena, in quartz and spar matrix. Judge Posey and John Dobbins are blasting steadily in the Wall Street, and dumping copper ore, as well as high-grade argentiferous galena, a body of which they recently intersected in a continuous vein of lively looking quartz.

MAGDALENA DISTRICT.—The recent work on the Graphic has disclosed an extraordinary body of ore, both in quantity and value. The Eaton concentrator is in movement and successfully turning out concentrates which are shipped to the Billing smelter of this city. The Silver Bell is the scene of continued and intelligent work, and its pay mineral is steadily increasing the dimensions of its ore dump. The strike made in the Jos. Cowen claim of the Magdalena district by James Stephens some days ago has attracted no little attention. It is an additional proof that much yet remains to be done by active and intelligent prospectors in our oldest camps. Mr. Stephens discovered and located the Cowen on the 1st of January last, after a few feet of work reached an important and valuable body of argentiferous copper ore.

PUEBLO DISTRICT.—Sinking continues in the South shaft on the Paraje mine. A full force of men are working on the Carnero mine, and ore is being dumped in a lively manner. Col. J. S. Hutchason is steadily developing his several properties and raising considerable pay silver, copper and galena ore. The Brittenstein M. & M. Co.'s mill started up on Saturday for a steady run, having placed in position their Frue Vanner and discarded the old-pattern concentrator.

MISCELLANEOUS.—Three cars were unloaded this week by Browne & Manzanares Co. They contained a 15-stamp mill destined for the White Oaks M. & M. Co., Lincoln county, of which Thomas J. Scott is the superintendent. It is a fine plant. Donald McRae is now superintending the working of his Lawrence mine in the Ladrona District, and is sacking a large quantity of pay mineral for shipment to Socorro for treatment.

OREGON.

QUARTZ AND GRAVEL.—Jacksonville Times, Feb. 19: Five men are at work on the quartz mill building in this place. Walker & Anderson are taking some rich ore out of their ledge on Applegate. Jas. B. Ivory and several others are now engaged in placer mining on Elliot creek. Higinbotham Bros. have discovered a very promising ledge in the Gold Hill district. Wm. Ruble of Cayote creek has two giants in full blast and is stripping off a large area of ground. Walsh & Bragdon are taking considerable ore of an excellent quality from their mines on Wagner creek. Walter Simmons has a large supply of water at his hydraulic mines in the Galice district and is making the most of it. Dugan & Herley, who have a quartz ledge west of town, have struck some very rich ore, and there seems to be plenty of it. R. B. Bannister of Uniontown precinct, who has been ground-slucing on his place, picked up a \$28 nugget a few days since. Lewis Hays and son are working A. H. Carson's mines in Josephine county and have stripped a large amount of bedrock with presumably good results. Most of the placer miners have already done more work this season than for the past two or three, which will ensure a good cleanup in case no timely rains fall. The discovery of a rich quartz ledge on M. Bickenbach's place near Woodville, is reported. The ore shows an abundance of free gold. Considerable excitement exists there in consequence. The pleasant weather has diminished the water in some instances, but most of the placer miners still have an ample supply. More rain may be expected in the near future, however. This is unquestionably the best season the placer miners have had for years, and we expect them to make a good cleanup in most instances, which will insure the circulation of a considerable amount of ready cash at the end of the season. Henry Wines of Jump-off Joe district, Josephine county, made a partial cleanup a few days since, which yielded nearly \$400. One nugget was worth \$45 and there were a few which weighed between \$20 and \$30 each. Mr. W. has a very rich claim.

BETTER OUTLOOK.—Baker City Democrat, Feb. 18: Encouraging proofs continue to come from the mining field as one result after another blossoms forth, which has cost years of toil and many dollars in money. The hard labor and faithful persistence which has been expended in so many unknown and unobserved portions of our vast mineral bearing territory is coming at last to the harvest and the outlook is certainly full of encouragement, even to those who have almost lost faith in the recompense coming in the slow and tedious march of events. The coming season, when all that has been accomplished is realized, will mark one of the most important epochs in the mining history of this country. Men will awake and find a new dispensation with the magnificent productive industry of mining established upon a new foundation, clean, solid, enduring—its requirements more generally understood, its real object clearly outlined and its possibilities better comprehended. Mining never yet has shown its best results and most valuable characteristics from the fact that they have not been sought in the line where they alone are to be found, but the marked improvement in satisfactory returns, shows that men from experience are learning wisdom and more nearly approaching the true line of successful operation.

TATUM & BOWEN,

25, 27, 29 and 31 MAIN STREET, SAN FRANCISCO.

91 and 93 FRONT ST., PORTLAND, OREGON.

Manufacturers of

MINING MACHINERY, ENGINES, BOILERS, Etc.

We are manufacturing from Special Designs of the most experienced and successful Practical and Scientific Experts, Complete Plants for all descriptions of Mining Operations, as follows:

CONCENTRATING MACHINERY—Best and Cheapest, Cornish Rolls, all Steel Wearing Parts, Most Practical Styles of Two, Three and Four Compartment Double and Single Jigs, Sizing Screens, Patent Hydraulic Separators, Tables and Concentrators.

STAMP MILLS for Reduction of Gold and Silver Ores, whether free milling or base. Most useful and substantial styles of Single and Double Discharge Mortars, Wet or Dry Crushing.

STEEL SHOES AND DIES, Tappets and Cams, cheapest and best Blake Improved Rock Crushers and Automatic Ore Feeders, Superior Amalgamating Pans with wood or iron sides.

PANS FOR TREATING GOLD ONLY, Settlers, Clean-Up Pans, Retorts, Furnaces, Dump Cars, Hoisting Machinery, Cages, Landing Dogs, etc.

CORLISS, MEYER'S CUT-OFF AND BALL'S PATENT VALVE Engines of extra strength and durability.

STEEL BOILERS of Two Sheets only, Steel Economic Boilers, combining with the safety, durability and economy of the Stationary Boiler, the convenience and portability of the Portable. It occupies but little space, and is the best and cheapest boiler ever made.

WE ALSO MANUFACTURE SAW MILL MACHINERY.

We are also Sole Agents for the Gordon and Maxwell Steam Pumping Machinery, and carry a full stock of all kinds of Mill Supplies, including the

Albany Lubricating Compound and Oils.

PATENT

LIFE-SAVING RESPIRATOR

Entirely Prevents Lead Poisoning
and Salivation

The most perfect appliance for people engaged in Smelting, Dry Crushing, Guano Works, Quicksilver Mines, Lead Corroding, and all other occupations where there is dust, poisonous vapor, or bad odor.

In Feeding Threshing Machines, and similar work, they are indispensable, as no foreign substances can be inhaled when they are worn.

The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, \$3.00 each or \$30.00 per dozen. Sent post-paid to any address on receipt of price.

336,493.—TICKET HOLDER—M. Rice, East Oakland, Cal.

336,174.—FAUCET—John Tilton, S. F.

336,180.—DRAFT POLE FOR VEHICLES—W. L. Walker, Brooks, Cal.

16,520.—DESIGN—J. M. Espinosa, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Mining Share Market.

Mining stocks continue dull in this city. Some of the Comstock mines are doing well but their operations have not buoyed the market up at all. The Consolidated California and Virginia mine is turning out a large amount of ore as usual, but not of high grade, yet it ships a goodly amount of bullion occasionally. Crown Point and Belcher stand in on the same proposition and so does Yellow Jacket, the regular daily output of ore from the Comstock amounting to nearly or quite 1000 tons. Drifting south on the 3,100 level of the Chollar has been resumed. The face of the drift is now passing the line from the Chollar into the Potosi ground, and unless too much water or some other adverse circumstance interferes, this drift will be carried entirely through the Potosi—700 feet—into the Bullion mine. The Ward or Bullion Combination shaft can be sunk 700 feet deeper to meet it, in case it is extended through which it probably will be, and thus a fine circulation of air will be established, besides other advantages. Moreover this will be the first step toward the pumping out of the Gold Hill mines, as the 3,100 of the Hale and Norcross and Chollar, through the Potosi, will strike and drain the lowest depths of the Gold Hill group. All this, says the *Enterprise*, however, is not merely the matter of a few days or weeks, but months and perhaps a year or two. But the Gold Hill mines will be pumped out all the same, inside of a year, whether the Potosi drift is run through or not.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports: Alice, Feb. 20, 1670 lbs. bullion; Lexington, 20, 1320 lbs.; Moulton, 15, 1219 lbs.; Silver Bow, 20, 640 lbs.; Clark & Larabee, 20, 139 lbs. (These shipments from these Montana mines aggregate in value \$80,638). Germania, 16, \$6177; Hanauer, 17, \$4500; Germania, 17, \$6475—18, \$3170; Hanauer, 19, \$8750; Germania, 20, \$2932; Hanauer, 20, \$3930; Stormont, 20, \$3300; Wells, Fargo & Co. shipped from Salt Lake for week ending Feb. 17, \$54,428; McCormick & Co. shipped \$51,570; T. R. Jones & Co. \$47,256, and Union Bank \$16,557. Of these shipments from Salt Lake, \$95,925 was in bullion and \$75,065 was in ore. Alice, Feb. 21, \$16,016; Hanauer, 21, \$3450.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

CALIFORNIA HAND ROCK DRILL

—FOR—
Drifting and Sinking.
Buy the best and latest improved Hand Rock Drill; can be run by hand, steam, compressed air, or water power. Machine made entirely of crucible steel; light, compact and durable. Strikes 300 blows per minute with 7-lb. hammer. A perfect reproduction of hand drilling; will drill one inch per minute in the hardest rock, using one-quarter the number of drills required by hand labor.

Machines on exhibition at No. 32 First St., San Francisco.
Send for circulars.
C. O. BARLOW, General Manager.

GOLD MINES AND Mining in California.

The new book with above title is one in which all gold miners will be interested. It describes the Quartz, Hydraulic, Drift and Placer Mining Methods, and progress and improvements made in the Business of Gold Mining. California is a grand field for the profitable investment of capital. The AURIFEROUS REGIONS are described, each County being separately treated, and the mines producing bullion or gold are described. The wish to know how and where gold mining is carried on in California, want this book.
Price, \$1.50, sent by mail, postage paid, on receipt of price.

GEO. SPAULDING & CO., Pub'rs, 414 Clay St., San Francisco.

HUNTINGTON MILL WANTED.

WANTED Cheap, a Huntington Mill; 3½ or 5-foot diameter preferred. Address

BOX 255, Station B., San Francisco, Cal.

THE CELEBRATED Woodbury Oils.

Pure, Perfect, Uniform!

The WOODBURY OILS are in use on the Central and Southern Pacific Railways, and on nearly every railroad and steamship line on the coast.

We are not agents for other manufacturers, but have our own works, and adapt here all our Oils to the requirements of home machinery and our climate. We can show recommendations and records of tests, showing a saving to our customers of 50 per cent on their lubrication last year. Address

CHARLES J. WOODBURY,
123 California St., San Francisco.
WORKS: Cor. Fifth and Townsend Sts

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

Cast Steel Castings and Steel Forgings

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.

—ALSO—

HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from 1 to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shapes Steel Wagon, Buggy, and Truck Tires, Plov Steel, Machinery and Special Shape Steel to size and lengths. STEEL RAILS from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled Beams, Angle, Channel, and T iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes, Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

Orders will have prompt attention. Send for Catalogues. Address:

DEWEY & CO.'S SCIENTIFIC PRESS PATENT AGENCY is the oldest established and most successful on the Pacific Coast. No. 259 Market St., Elevator 12 Front St., S. F.

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.**

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS.
(575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco. As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 30, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Room 7—No. 109 California Street.

SAN FRANCISCO, CAL.

\$1,000 CHALLENGE ACCEPTED.

PRICE, FIVE HUNDRED AND FIFTY DOLLARS
(550.00).

**THE
"TRIUMPH" ORE CONCENTRATOR.**

The present improved form of this celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE, placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 Fremont St.,

San Francisco, Cal.

1850. 1885.
RANKIN, BRAYTON & CO.,
MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS of 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN by RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE TRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all the AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 600 feet of five-eighths steel rope. SEND FOR CIRCULAR.

Slide Rules and Calculators.

The employment of mechanical devices for performing operations of computation has attracted the attention of arithmeticians for a couple of centuries past, and is to no class of persons of more direct interest than to those engaged in technical callings. These endeavors have been pursued upon several distinct lines, and we may notice by way of classification:

1st. The endeavor to perform desired arithmetical operations by devices distinctly mechanical in their nature, and seeking by the skillful combination of mechanical elements to carry out the ordinary sequence followed in the computer's calculation, which they seek to replace. We may here mention the celebrated machine of Babbage, and as a more recent illustration the "arithmometer" of Thomas, an instrument of only moderate cost, and one coming constantly into greater use.

2d. The use of geometrical figures representing the mathematical relations subsisting between mutually interdependent quantities, which, first suggested by the development of the Des Cartian geometry, have in very recent times developed into a new science—that of graphostatics—which not merely seeks to graphically present the deductions of analytical reasoning, but which, starting at the elements, builds up, step by step, methods of its own in which the arithmetical conceptions of magnitudes fall more and more into the background and are replaced by operations, mechanical at least in their application if not in conception and it goes for granted what an agent of constantly increasing power the graphostatics have become in adept hands.

Besides these two methods, we have another, somewhat partaking in nature of both the preceding, yet embodying a distinct principle of its own—that of the logarithmic slide scale.

At a recent meeting of the Technical Society of the Pacific Coast, Hubert Vischer, of this city, read a paper on "The Principle of the Logarithmic Slide Rule," from which these remarks are taken. This slide rule is of wide application, certainly of interest as an important agent for the saving of time-robbing computation, and worthy of more general employment than has been accorded to it in this country, although at least on the continent of Europe the slide rule has already become the engineer's daily pocket companion.

The slide-rule reduced to its primary elements owes its origin to a happy application of two most simple principles: the first, that magnitudes in general may be represented by the length of straight lines; the second, that these lines, when measured off upon one another may represent by the length of a resulting straight line either a summation or a difference of the magnitudes which the lines represent. The first principle underlies the logarithmic graduation of the scales; the second principle finds applications in the sliding motion which we impart to them. Slide-rules there are, of various constructions and for many purposes, but they may all be reduced to a combination of these two elementary principles.

The use of the logarithmic graduation here, as in all other cases where logarithms are employed, is the outcome of the desire to reduce all arithmetical calculations by one step in the

tion of the scales; the second principle finds applications in the sliding motion which we impart to them. Slide-rules there are, of various constructions and for many purposes, but they may all be reduced to a combination of these two elementary principles.

logarithms are represented by the same figure. The scales are all mounted upon a zinc disc (which is capable of being freely turned on its axis) and two needles—one fixed, the other movable. Expressions as complicated as—

$$1/a \cdot \frac{b}{c} \text{ or } \frac{a^2 b^3}{c^2} \text{ or } \sqrt{\frac{a^2 b^3}{c^2}}$$

selected at random out of a list of about 50 pattern forms, may be solved at one single setting

Stamps.

The most common size for a quartz mill seems to be 20 stamps. In new mills the usual weight of stamps is from 700 to 800 pounds each, though great variations occur in practice. In the census reports, tables are given which show the weight of stamps of various mills. The range in weight is from 300 to 1050 pounds. The average of 280 mills, reported as having 5,367 stamps, is 689 pounds. The heaviest batteries, as a rule, are in Nevada, and the lightest in Alabama and Georgia. Of the important mining States, Colorado appears as the locality where the light stamps are most in vogue.

Five is the usual number of stamps in a battery, though some of the old mills have four. One mill in this State has six. Millmen are commonly of the opinion that an even distribution of pulp in a battery can only be secured with an odd number of stamps, and of such numbers five is on several accounts the most convenient.

The weight of the shoe bears a certain relation to the weight of the stem, tappet and boss. For a stamp which weighs 800 pounds the shoe should weigh about 125 pounds and the die, say 100 pounds. Some millmen advocate a very thick die, but the one great objection to this plan is that the loss of crushing power when the level of the die surface is worn much below the discharge more than compensates for the gain in time and material in charging dies less often, and if the thick dies are set high at first the breakage of screens is much above the usual amount.

In gold mills where amalgamation is carried on, in the battery, the level of the die-surface is kept from 2 to 6 inches below the discharge in order to amalgamate as much gold as possible in the mortar. By means of a movable slide at the bottom of the screen, the level of the discharge can be kept the same as the die wears out. In silver mills which crush wet it

HERMAN'S CALCULATING MACHINE.

scale of mathematical operations; thus replacing multiplication and division by addition and subtraction, or reducing involution and evolution to multiplication and division.

We are unable to give at this time Mr. Vischer's remarks on the slide-rule proper, but confine ourselves to another instrument he describes—the very interesting calculator of Professor Herman, of Aix-la-Chapelle, which is also a slide-rule in principle. In this instrument (shown in the engraving) additional length of unit is attained by development of the scale upon a circle; besides, on account of the great number of scales combined together, a considerable extension of the range of direct application is attained over the ordinary slide-rule. We have ten scales, directly giving simple numbers, squares, cubes, areas and peripheries for given diameters, logarithms, sines and tangents, with the last two a separate scale being provided for each set of angles, the characteristics of whose

and turn of the instrument. The principle of the slide scale was first applied by Gunter, shortly after the discovery of logarithms. It made little progress until the middle of this century, but since that time has found application. The field is an unexhausted one, the principle capable of great development. Other mechanical constructions will undoubtedly arise, which surely will extend both range and accuracy, and special applications to special cases lie within the reach of anyone caring to apply them.

OUR Virginia City correspondent gives us this week quite a graphic description of the region thereabouts, which will repay perusal, especially by those familiar with the locality.

THE Chico Chronicle says: The Big Bend tunnel will soon be completed, the workmen only having 600 more feet of earth and rock to dig through.

is intended to keep the surface about one or two inches below the level of the discharge; but as the die wears down its surface is gradually lowered, and thus decreases the crushing power of the battery.

It is the aim of the millman to keep his die as high as possible, without endangering the screen, so as to utilize most of his die to the best advantage. In dry-crushing silver mills this is also the case, except that there is a greater loss of power in the dry than in the wet crushing battery where the die surface is much below the level of the discharge.

The maximum drop obtainable is not the same in silver and gold mills, as the stamps of gold mills should drop further than those of silver mills in order to produce the splash which assists in the battery amalgamation. In gold mills the maximum drop obtainable is from 12 to 20 inches, and in silver mills from 9 inches upwards.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Virginia City, Nevada,

As Seen from Mt. Davidson.—A Sublime Panorama.—A Striking Picture of Diversified Scenery.—The Camp as Seen From Above.

[No. 5.—By Our Special Correspondent, J. B. P.]

As we clambered over this immense wreck of mountain pottery and gained the most conspicuous eminence on Mt. Davidson, we rightly conjectured that the impression of the city beneath us would differ materially from that which was received when first viewed, and stereoscopically painted, as it were, on the mountain side whilst approaching from old Fort Churchill; nor were we greatly mistaken. Whilst the snow still lay, at great depths, on the north side of the mountain, yet we found the top quite bare, and the outcropping quartzite scattered in such prodigal profusion all over 'his promontory strikingly recalled to us the fact that we were still upon this territory of the old Comstock bonanzas. Our ascent of this peak, however, had more in view—an æsthetic rather than a metallic object—and we were soon lost to all but the surrounding scenic wonders. Having traversed the Rocky Mountain chain the entire distance from British America to a point south where it is dashed into the tumbling, crosscut and diagonal ranges, monopolizing all Western New Mexico and Eastern Arizona, till finally it is gathered into the mother of mountains (Sierra Madre), running thence to the Isthmus, it could hardly be expected that we should meet with any very extraordinary or startling objects of interest from this point of observation. However, the holdness of this spur among its neighbors is so marked that for 40 and 50 miles around it is a noted landmark in this part of the State. Towering aloft

Above the Comstock Lode,

Virginia City and Gold Hill, it rises so abruptly as to be almost monumental in its characteristics. Prof. George Davidson, in his maturing years, might well take a modest and professional pride in this ever-enduring memorial and namesake, christened to his standing, dignity and worth by his admiring friends in this community. Had he ranged his telescope from this lofty watchtower of the hills on the 12th of February when taking an observation of the eclipse of the Hyades of Taurus by the moon, instead of San Francisco, he certainly would have found a clearer sky and still more resplendent glories in that celestial phenomenon. The beautiful snowy range which may be seen, even at midsummer from the Sacramento valley, lying far to the east, here comes to greet us, in its sublime majesty, all along on our west as far as the eye can reach. The phosphorescent light of this North America Andes now glows with blinding splendor as it reflects the slanting rays of the evening sun.

The Pure Drapery of Snow

That now spreads its mantle over crest and peak, dell and dale, making, as it were, one tumultuous, billowy sea of the whole western horizon, is never wholly laid aside. It may be seen amid the glowing heats of August turning against the burning sun its glittering Medusean shields of white, and converting the Sirocco blasts of these desert winds into the healthful life-giving breezes and tropical showers. To the east of this main range, and lying in every possible attitude and direction, we observe as far as our telescopic instrument can reach, other lofty and broken links of unformed chains crowding this horizon to the north, east and south, like some mighty army of giants marching in separate columns and divisions to meet a common foe in unbroken and bannered Sierras, to force, perchance, if possible, their way to the tidal breezes of the Pacific, and there, for once, plunge their burning, naked heads and granite ribs into the cooling floods of the Occident. Vain hope! They have met with something more than a disastrous Waterloo, and the silvery marrow extracted from out their leaching bones will henceforth perform infinite service in greasing the wheels of commerce and furnishing head-lights and heacons to guide the ship of State away from the shoals of bankruptcy. Whilst, however, we can see on every side of us mountains, we discover, lying adjacent and corresponding to these elevations, beautiful valleys and outstretching plains. Along and through the midst of these we can see many coiling streams and rivers, whose bright threads of amber light can be traced for many miles into the obscure distance. Upon their borders can be seen cities, towns and villages, and frequently scattered here and there, on ranches, noble mansions with groves and barns adjoining. The Carson, Truckee, Maron, Smith, Antelope, Washoe and some other valleys lie in a cluster about us, a number of whom contain tens of thousands of acres of most fertile and tillable soil, much of which has already been brought under subjection.

Carson River

Takes its rise at the head of Carson valley, from the melting snows of the Nevadas, runs

twenty-five miles northerly to Carson city, the capital, and thence running ten miles east passes the city of Dayton, and continuing easterly still some forty miles further, debouches into what is termed Carson sink, and disappears. Prof. Rue, of Boston, with his organized company, has, during the past ten days pre-empted, or located eighteen miles of the head of this stream, and will, by the 1st of June, commence operations with his dredge boats to sluice out the slickens, or tailings deposited therein from the old bonanzas on the Comstock. The process of saving from the debris the untold millions of gold and silver, which have undoubtedly found anchorage in the bed of the Carson, is an invention and contrivance of Prof. Rue's own labor, and he is most sanguine of success. As he is sustained by an abundance of capital, we may look for a thorough prosecution of the enterprise at once. Along the banks of this river, east of Carson city, and extending some ten miles are some of the most complete and successful mill plants to be found anywhere in the Pacific States. At these mills nearly all the ores taken from the Comstock lode are now being crushed and concentrated. These mills are such as to harmonize with the magnitude of the plants heretofore described as located upon the Comstock, and are under the management of the most skillful and scientific workmen.

At the base of this Mountain

(Mt. Davidson) on which we now stand and to the west of us lies Washoe lake partly filling the valley of the same name, two miles in width by six in length, and reflecting the sun directly in our faces like a burnished mirror. Farther north can be seen the famous Steamboat Springs, and ten or twelve miles further in the same direction, we can discern with our glass a faint thread of light representing the rushing Truckee river, which issuing from its deep mountain gorge, hurries by the beautiful city of Reno, with its seven thousand people, and its numerous State institutions, prosperous schools, academies and colleges, and after pursuing its swift course many leagues further on to the east, is lost to mortal view in its desert sink. Beyond Washoe lake, and spread out in the very summit of the Nevada range, some 35 miles distant to the west, and about 2000 feet above the intervening plain, is that remarkable body of water known as Lake Tahoe, becoming so familiar and attractive to pleasure and health seekers, both in California and elsewhere. This lake, 10 by 30 miles in extent, and in depth still unfathomable, is without dispute one of the purest and sweetest bodies of water to be found in North America. Virginia, Gold Hill, and in fact the whole population about this camp, receive their supplies of water direct from this neighborhood of this vast lake reservoir, by a well-devised system of water works, and it is but fair to assert that no city on the face of the earth was ever more richly blessed by a finer article of this most needed and most indispensable fluid.

We are unable to look down upon the face of this extraordinary body of water, from the top of this mount, but we can, without standing on tiptoe, even, discern the tall and waving coronet of green pines that stretch far back from its margin, in one wide encircling wreath of timber land. And now, in brief, we have gone over with the assistance of our telescope one of the principal, fairest and most productive portions of Nevada. There are other sections which will doubtless compare favorably with this, but for extent and richness of ores, populous cities and towns, and the value of its agricultural wealth, we have comprehended and meagerly described in this survey, that which will be counted first and foremost in the State. Nearly 2000 feet below we look down and take

A Survey of Virginia City and Gold Hill.

Almost every house and object for more than four miles in length are taken in at a glance. What a miniature display! Here the whole mining plant, consisting of more than fifty extensive structures, richly endowed with the choicest and most costly machinery, stand out to the eye in bold relief. Their aggregate cost and value would be more than sufficient to purchase all the college and university plants in ten principal States of the West. The puff and wheeze of many of them indicate life and motion far down in the bosom of this mining industry. But the time for descending has come, and we speedily retrace our steps, and enter once more the streets of the city.

A Miner's Death.

The large, sweet-toned bell on the Catholic cathedral is tolling—so deeply and solemnly tolling. What can it mean? Ah, yes, a nobleman died here two days ago. He was not born to any English manor but in a village in Geauga county, Ohio. But his descent was noble and he sprang from a stock whose blood was steeped in patriotic devotion and enthused with the warmest deeds of humanity. An army of men, dressed in the livery of woe, is tramping eight abreast through the principal street, and every vehicle of two cities sweeps into the train. There appear to be more honest tears shed at this funeral than when Lord Wellington and many other generals since his time left their fame and bloody deeds behind to enter upon their final reward. This disguised nobleman was of such independent and royal blood that he appeared to be connected with no order, civil, military or ecclesiastical, but having lived here 20 years or more and having discovered several bonanzas and landed on the surface more

silver dollars than most hankers ever saw or handled, the people, knowing and appreciating his kindness and benevolence to thousands who have come and gone from these mines, turned out en masse to pay their last respects to his remains, and to share their sympathies with his stricken family. The able Catholic clergyman too, seemed to vie with the people, and after reading a short prayer entered upon a very eloquent Christian oration to the densely crowded auditorium, breaking down all barriers of formality. And this well-known but modest and retiring citizen, whose disease has created such a sensation in all the higher and lower walks of life here, was no less a person than Mr. H. Lamb, one of our first acquaintances formed here, foreman of the Consolidated Virginia and C. and C. mines, who so nobly and kindly introduced me to Mr. J. B. Shaw and other assistants who were to aid in my visit to this mine. His demise is mourned by all amid tears and benedictions.

If these mines have made millionaires, they have also fashioned and molded some men with characters which millions cannot create or buy.

While the output of bullion here has been enormous, it has by no means been adequate to alchemize some types of characters, and to turn such fine metal to dross. The hopes of a world are largely dependent upon the words and deeds of such men. J. P. Jones and J. G. Fair are the natural political creations of this camp, and now in their senatorial seats in Congress are counted upon as infallible representatives of the common people throughout these Western and Southern States. It is well known that millions of money could not swerve their vote in any important legislative action concerning the welfare of the public. Firstly, they do not need the gold nor the silver; and, secondly, all the accumulations of Wall street combined would not be sufficient to convert them into political knaves.

Bishop O. W. Whitaker, of this Episcopal church, with his hundred young lady pupils gathered from all parts of the State into his noble Christian school at Reno, has done his principal work in this city, prior to founding the above college. It is certainly an institution that would reflect credit upon any State in the nation, and owes its origin to a pioneer workman who has devoted the strength of his years to moral and educational culture in this camp. Whilst the inordinate love of money is most certain to work corruption, yet the seven times heated furnace that has tried true moral worth in this camp, has brought forth from the reduction works, in the end, something that the world may well prize as more precious than gold or diamonds.

Mineral and Metalliferous Veins—No. 2.

EDITORS PRESS:—I observe that a former article of mine on this subject has at least been the means of some adverse criticism. However, as none of my opponents have seen fit to prove my theory false or substantiate their own true, on a practical scale, it is needless to say that I still hold to that which I conceive tenable. In the first place, I have no time to refer to the assertions in detail of my critics, for the simple reason that it would require considerable space in the PRESS, and, to be brief, the game is not worth the powder. I was somewhat amused at the sophistry of Mr. Brown in reply to my article. This gentleman evidently seems to think that I make a specialty of combating natural facts—that I have no desire to know the truth, even no fear to believe an untruth. Now, it is useless to say that the exact opposite is what I hold. I do so, mind you, merely to inform and set aright all those who adjudge me guilty of intentional deception. What I meant in my former article is, that I have given the subject many years study and based all on facts as derived direct from nature.

Mr. Brown exclaims that "it is human nature to meet each new discovery with opposing forces, nevertheless truth will prevail." So it is plain enough, according to that, to conclude that Mr. Brown considers the writer a crusher of truth. I wish to say right here that I consider "the discovery" of Mr. Brown "the new discovery"—the "tin type" plate referred to, of no use whatever to the solution of the very intricate question of the genesis of ores or metalliferous veins. "The chemically prepared metal-plate" may be of interest in itself, but surely it can be no criterion whatever in solving the matter in question. Like causes produce like results. The terrestrial globe is one thing, and "a chemically covered metal-plate" another. One is exquisitely simple, the other profoundly complex—one is the work of man, the other that of nature. There is no analogy, and there is no use to discuss the subject, as stated, with the hopes of gaining new light. Any person with an atom of reason in their composition will be forced to dismiss the question as barren of practical results, as well as see that it is "theoretically superstitious!"

"Metal plates" cannot be the philosopher's stone with which to settle the question. But I do not believe that the light of science will lead to the fire of truth—"satisfactory results can come only by natural observation." With the facts in hand the work can be proved. The way to do this is to not leave the mines but

stay with them. We cannot see beyond the pick and drill, to be sure, but we can, most assuredly find out some of the unknown secrets of nature by staying with this facts, "and surely not by ignoring them." Mr. Brown asks: "Who has ever learned of a hot spring filling a crevice with precious metals?" It seems that he is not aware of this fact that the Steamboat Springs of Nevada are constantly doing so. That the waters are strongly alkaline and depositing silica in abundance; that the fissures are being filled with this ledge matter and that in the same may be found the sulphides of iron, zinc, mercury, lead and copper, while assays reveal gold and silver. About the geysers of the Yellowstone National Park I have also observed the deposits, from solution, of silica, and escrite in some of which shows iron sulphides. Doubtless both gold and silver would be present were it not a sedimentary formation—"being largely magnesian limestone and fossiliferous blue lime (Silurian and Devonian)." I find that the metals gold and silver are mostly derived from the older rocks, especially the metamorphic rocks. And that the metals in the veins are leached from the rocks, from the adjacent formation in which the veins or deposits are situated. And I hold that the richer metalliferous solutions come from below. Those heaviest in metal are from the more extensively metamorphosed rocks. Deep fissures reach those parts in the earth where chemical activity is very great. At such places I hold are the sources of the precious metals. The mineral solutions on reaching a fissure precipitate their metallic wealth either chemically or mechanically—either through chemical affinity, or else the agency of heat causes the waters to evaporate, thereby leaving all mineral or metal which it once contained in solution.

The formation of rock candy or rock salt is similar to that of crystallized quartz or Iceland spar. It is all under and according to the same law. Place a drop of ocean water in the field of a microscope and observe the formation by evaporation, and it will give you an idea of what I mean. The minerals may be seen to crystallize from the solution, and it is a sight worthy to be seen. But enough at present. I am pleased to see our subject agitated, knowing that the truth will prevail.

For the interest of Mr. Brown and other opposers of the solution theory, I wish to say that some five or six years ago I remember reading in the PRESS about some old mines in Arizona. The mines had been abandoned for many years, and of course were full of water. When this water was pumped out it was found that mineral and metalliferous incrustations had formed even on the old timbers. Small particles of gold were taken from the wood, while an assay of the outer parts of the timber showed several hundred dollars to the ton. I would like to know how this metal came there unless deposited from solution. For my own part, I am convinced that the solution theory is the true one; that the metals in the veins are brought in by and deposited from the solutions (mineral waters); that it is being done at the present time as it has been in the past, and will continue as long as the conditions remain favorable. Anyone acquainted with the rudiments of crystallography can readily perceive that the structure of ores as we find it in its original state must have formed from the mineral solutions. Mr. Brown holds (believes) "that the spurs are 'feeders' to the main vein." I hold that the main vein is the source from which the spurs are filled, and I also hold that "contact veins" are formed in the same manner as fissure veins, excepting those cases where the strata may have been folded. When an extensive formation is thrown on end (vertical) it is or can be an easy matter for a fracture to happen or a fissure to be broken between the different rocks. The line of cleavage between two different formations is not so strong as that of a single formation. Most mineral veins are simply what is known in geology as "faults," especially those veins of which the walls on the two sides do not correspond with each other—one side has been pushed up or dropped down, hence a fault; and in these faults—"some of them," we find mineral and sometimes good mines. These are facts, and don't you forget it!

CHAS. F. BLACKBURN.

Kayseville, Utah.

AN official decree was published February 1st in Paris announcing the appointment of a permanent commission, charged to examine all questions connected with the monetary standard in France and foreign States.

STEAM BOILER INSPECTION.—The Judiciary Committee will report at the next meeting of the Board of Supervisors against the introduction of an order providing for the appointment of an inspector of steam boilers.

C. C. STEVENSON, one of the most prominent mining and milling men on the Comstock, received a handsome cane from the employees of the Kentuck mine, on the occasion of his 60th birthday.

A BED of coal 20 feet thick has been discovered near Oilequa, W. T., and it will be at once opened. A large deposit of alum has been found in the same locality.

THE Churchill Soda Company of Nevada have completed their furnace and have on hand about 300 tons of soda ready for drying.

MECHANICAL PROGRESS.

A UNITED STATES BUILT GUN FOR THE BRITISH NAVY.—No little excitement was recently produced among English steel masters, by the receipt at the Woolwich Navy Yard of a 40-ton steel gun, with its projectile by its side, which had just been received from the United States. The fact was duly announced, with comments, by the *London Times*. The gun was one of Ericson's late inventions for submarine use. It is 30 feet in length, with a 16½-inch bore. This novel weapon throws a projectile 25 feet long, weighing one ton. The idea is to fit the gun in the bow of a ship nine feet below the water line, so as to fire straight ahead from the cut-water. The projectile, notwithstanding its great length, weighs only one ton; but the principle of the gun admits likewise of the firing of torpedoes as well as projectiles below water. Lying charged under the sea's surface, the gun has a diaphragm of india rubber fixed over the muzzle to exclude the water. This, of course, is instantly blown away, when the gun, whose projectile has been inserted at the rear, is exploded. A charge of 20 lbs. of powder is all that is considered necessary for propulsion throughout a submarine range of 300 yards. The experiments will prove whether more than half this distance can be accomplished against resistance of the water without a sacrifice of striking power. How the gun is to be reloaded after the first discharge has not, we believe, been explained. British steel will doubtless be used, if it should be found desirable to duplicate the gun.

THE MANUFACTURE OF FILES.—The improvements and changes in the manner of making the common, yet indispensable instrument, the file, in its various forms and for variety of uses, have been many. The first files were probably made from the dried skins of fish, species being selected the skin of which had a fine and tough scaly surface. After this metallic files came into use, but for centuries the forms of files were rude and their execution was very rough and imperfect. With the rapid advancement of the various mechanical arts, German, English and Swiss file makers greatly improved their wares, until it seemed as though they were little less than perfect. Switzerland has furnished for many years the greater proportion of the files used by jewelers, watchmakers, gold and silver-smiths, dentists, etc. Within 20 years American file making has made such progress by the application of machines to do the work performed by foreign makers with a chisel and hammer in the hands of a workman, that our markets could very well supply the wants of any artisan with American files. They are made varying in size from two inches in length, with 150 cuts or teeth to an inch, to those of 30 inches, with only 12 teeth or cuts to an inch. File makers in the United States use nearly or quite 4,000 tons of steel per annum, and some of their establishments make more than a thousand files per day.

PRESSURE ON BEARING SURFACES.—The pressure which may be permitted upon rubbing surfaces is determined by the velocity of rubbing, the character of the lubricant and the nature of the surfaces themselves. The two surfaces should usually differ, one being hard enough to bear the maximum pressure without change of form, and the other being less hard, in order that it may not abrade the first. With such an arrangement the surfaces, if properly cared for, take a fine, smooth, mirror-like polish and give a minimum frictional resistance. Cast-iron surfaces, according to Thurston, unless very large, are less satisfactory than good wrought iron, and moderately hard steel is much better still. A pressure of 800 pounds to the square inch can rarely be attained on wrought iron at even low speeds, while a pressure of 1200 pounds is not infrequently adopted on the steel crank-pins of steamboat engines. Pressures from 7000 to 9000 pounds per square inch have been reached on the slow working and rarely moved pivots of swing bridges. Pressures higher than from 600 to 1000 pounds per square inch on iron and on steel are to be avoided, and for general practice the pressure is less as the speed is greater, since the amount of heat developed is directly a measure of the amount of work done in overcoming friction, and is thus proportional to the speed as well as to the pressure.

FOREIGN VS. AMERICAN BLOOMS.—The fact that large quantities of foreign blooms and billets are being brought to Pittsburgh and vicinity—the great center of the steel industry of the United States—is not soothing to our local pride; but the smart is less painful says the *Iron Age*, when it is remembered that the foreign invasion is solely the result of the high wages paid in this country.

Yes, but if such a condition of things is to continue indefinitely, the smart will soon become wellnigh unbearable. The only remedy that suggests itself to avert such a calamity, is the reduction of wages here or an increase in protection to our workmen. This country cannot afford to import her iron from England.

BRITISH BAYONETS.—A very lively stir is being made among English ironmasters and others, about the defective bayonets which are being found, on testing, in the hands of her soldiers. From 15 to 25 per cent of these are defective in one or another respect. The newspapers are making a great row about the mat-

ter, and allegations are made, first, that the bayonets were made in Germany or that the steel was procured there. Alternatively they are said to come from Birmingham, but the makers in that town have not supplied any for 10 years; consequently, the fault lies with the Ordnance Department. That department brings some steel from Germany, but mostly uses Sheffield brands, and it is understood that these had weapons are stated to have been made from Sheffield steel. This is not credited, and the general idea is that the English people have in some way mixed up the steel and do not know exactly whether they used Sheffield or German.

AN INVENTION TO FACILITATE PLASTERING.—While almost or quite every other art and science, has been improved in facility or quality of work, plastering seems to have remained stationary, if we except only the means employed for elevating the mortar to the workman. But a device has recently been invented which may be termed a plasterer's platform, which is set on casters and which may be elevated or lowered to wall or ceiling as the convenience of the workman may require. Accompanying this device is an improved two-hand trowel. The platform is capable of extension in a horizontal as well as in a vertical direction. By the combined use of these two inventions all cumbersome staging and the old antiquated hod and short single-handed trowel used ever since the building of Solomon's Temple are all dispensed with. The mortar is placed in an extensible trough, which is suspended on the platform convenient to workmen. The apparatus can be readily moved endwise through doors from room to room. It is claimed that by the use of these devices the cost of laying on either plaster or hard finish is reduced fully one-half, and the work made much easier.

SELLING MACHINERY.—The manufacturers of the best class of machinery sell the same on its exact merits; they find no use for extravagant words in which to state the good qualities of what they sell. It would be better if all connected with the manufacture and sale of machinery adopted this course. Extravagant promises usually defeat the end in view; too much is known in a general way of the possibilities and impossibilities of mechanics, to permit of their having any weight in the desired direction. They damage the one who makes them, and unfortunately they work injury in another direction. If a man really makes substantial and somewhat phenomenal progress in some direction, he has difficulty in introducing what he has perfected, from the fact that his device is likely to be judged on the basis of extravagant promises. A plain statement of facts is, in the end, the best.

THE ADHESION OF FRESH MADE AND REMELTED GLUE.—According to Tredgold the adhesive force of fresh-made glue, cementing together two pieces of dry ash, after being left for 24 hours, was found to be 715 pounds to the square inch. With glue which had been melted the adhesive power was reduced to from 350 to 360 pounds to the inch. The lateral adhesion of the fibers of a piece of Scotch fir, quite dry and seasoned, was found to be 562 pounds to the inch; therefore with fresh-made glue the wood would have parted before the glue. The strength of common glue for coarse work and to stand the weather is increased by adding a little finely-powdered chalk.

STOVE PIPE JOINTS are now made to screw together. A machine has been devised which, while it bends and forms the joint at the same time forms the proper thread at each end of the joint. The same machine will form joints of different diameters by merely changing the simple device which forms the thread. Pipes so joined are much stronger and stiffer than when put together in the ordinary way.

A HEAVY DAY'S WORK.—In January last there were turned out at the Joliet Steel Works the result of one day's run of their rail train 1658 30 foot rails in 10 hours and 45 minutes—a few days later the same train turned off 1728 rails in 10 hours and 15 minutes. The labor of controlling the machinery, doing the blooming and finishing was performed by five men. The rails were drawn from 14-inch ingots direct.

The efficacy of iron bulkheads in steamships was strikingly shown in the case of the steamer *Crystal*, bound from Newcastle to New York, which was ten days at sea with fire in her main hold. By closing every aperture which could admit air to the cargo the steamer was kept afloat until fire-boats came to her relief in New York harbor. The damage was about \$10,000.

DRILLING IRON AND STEEL.—For turning and drilling wrought-iron and steel, one ounce of a mixture of soft soap, with half its weight of pearl-ash in about one gallon of boiling water, is in everyday use in most engineering shops. The work, though constantly moist, does not rust.

A LARGE PULLEY.—In England a pulley 63 feet in diameter and weighing 83 tons, has just been made. It has grooves for 32 ropes, which together will transmit 1280-horse power, and the rim will have a velocity of more than a mile a minute.

SCIENTIFIC PROGRESS.

Increase of Damage From Lightning.

German scientific papers and scientists are just now much exercised over the result of some statistics which have been recently collected and published, and which go to prove the rather unexpected and unwished for discovery that the amount of damage done by lightning in Germany and the neighboring smaller States is rapidly increasing from year to year.

A German electrical journal, in a late issue, says that the whole question of danger from lightning has assumed a new aspect during the last 15 years, and taken increased importance not only from a meteorological and scientific point of view, but also from that of the public welfare. In 1869 the well known meteorologist, Professor von Bezdol, published the results of an investigation he had carried out, based upon the books of the Bavarian Fire Insurance, in which about 90 per cent of all existing buildings are insured. In these books accurate account would be kept of all the cases in which lightning had affected any of the insured buildings. The first results of this investigation show that there was a regular increase going on in the number of instances of lightning striking buildings, reckoned as percentage on the buildings, of course; and a later publication in 1884, giving a continuation and more exact and complete examination of the figures obtained, showed the result to be that during the 50 years from 1833 to 1882 the percentage of insured buildings struck by lightning in Bavaria had increased at least threefold.

The publication of this investigation caused others to be undertaken, and one for the Kingdom of Saxony showed a similar increase. Professor Holtz in 1880 published a second series of statistics based upon German insurance companies' books which fully sustained the proportion of increase already named. Returns have been more recently issued concerning the provinces of Prussian Saxony for the two decades 1864-73 and 1874-83 which show that from one decade to the other the risk from lightning has almost doubled. The final conclusion to be drawn from this considerable mass of apparently reliable figures is that, for the whole of Germany, during the years between 1850 and 1880 the lightning risk has increased threefold. That is to say, out of any given number of buildings three times as many would be struck by lightning during 1880 as were struck during 1850.

So far as can be seen, the increase is still going on since 1880, and there seems no reason to doubt that we have to deal with a steadily increasing risk of damage from this source. This is sufficient reason for urging the great importance of protecting all buildings by means of properly constructed lightning conductors.

The steady increase of the danger being thus apparently proved on the best authority and admitted, the investigator naturally tried to ascertain in which direction they might look for an explanation of the facts, and the question mainly arose as to whether the increased number of lightning strokes is caused by an increased number and increased severity of thunder-storms or whether the reason lies in some changed conditions of building, as more especially the greater use of metal in construction and in gas and water pipes, etc.

The two principal authorities named above appear to have arrived at different conclusions. Professor von Bezdol holds that so far as concerns his investigations in Bavaria, both the number and intensity of thunder-storms have increased, and that any influence of the mode of construction of the buildings is quite a secondary matter.

Holtz, however, in his investigations based on meteorological returns, fails to find any proof as to increase of storms, whereas he has prepared, at great trouble and expense, statistics to show that exactly those districts in Germany, where most metal is used about the buildings, are also those in which the largest number of lightning strokes are recorded. It appears clear, however, that when the explanation has to be looked for, we are no longer on good, solid ground. Probably, now that these surprising facts are pretty well established and are attracting a great deal of attention in the proper quarters in Germany, very exact records as to thunder storms will be prepared, and will, in due course, enable more decided answers to be given as to the cause or causes of the increase of damage done.

It would be of very great interest to know whether any returns have been prepared as to the effects of lightning in this country. Certainly no part of Germany can be less addicted to lightning rods than we are, if we except churches and tall chimneys. It is stated in the article from which we have quoted, that one or two special districts, as Saxony, are very much better provided with conductors than the rest of Germany. It would be interesting to have some definite statement as to the amount of protection which can be proved to have resulted in these specially cautious regions. The figures quoted above, from the Kingdom of Saxony, would appear to show that, however well it may be protected by conductors, it certainly comes in for its fair share of the general increase of lightning strokes.

PROGRESS IN SPACE.—There are only two

kinds of progress in space. One is that of matter, the other is that of form. An arrow discharged from a bow, or a bullet from a gun, represents the former of these, while the ever-widening circles which follow the plunge of a stone into a pool of water represents the latter.

Refining Sugar by Electricity.

The aid of electricity has of late years been successfully invoked in aid of numerous industrial processes. The latest application of this subtle agent has been in the direction of refining sugar, which it is stated has proved a complete success, doing its work with great rapidity and economy, far in excess of any process heretofore devised. The invention is that of Professor Fried of New York; but the method by which the process is accomplished has not yet been made public, the trials having been made in the presence of experts only. Even they have only been permitted to witness the results and not the *modus operandi*—the effect but not the cause, at least not in detail. It is stated, however, that the invention has been thoroughly tested and upon a commercial scale, with such success as to induce the formation of a company in New York for an extensive refinery by this new process. It is affirmed that by this new process, raw sugar of the lowest quality can be converted into refined sugar of the very best description as easily and at the same cost as raw sugar of the highest quality. The process of conversion does not require in point of time more than four hours, that is to say, from the time the machinery is set in motion, the refined sugar is produced inside of four hours, and the production once commenced, the output of refined sugar is continuous, so long as the raw sugar is supplied. This is a great saving of time over the most expeditious of any of the ordinary processes. It is claimed that the product upon analysis shows no less than 99.9 per cent of pure sugar. In addition to exhibits of this product in New York and other cities on this continent, several barrels have been sent to Liverpool, where it is pronounced of the best quality and is exciting a large amount of attention. Should the new process prove all that is claimed for it, it will materially interfere with a large industry involving millions of capital, both in this country and Europe, and lead to important changes in connection with the sugar refining industry generally.

A NEW MOTOR POWER.—A motor in which the power is derived from a supply of caustic soda is being tested on a new street railway in Chicago, apparently with excellent results. It is claimed for this device, according to the *Railway Age*, that it is noiseless, economical of operation, reliable, and of course without smoke, steam or cinders, and capable of running up to ten miles per hour, and of being stopped, at ordinary street-car speed, within a distance of five feet. The two motors which have been procured for this road were imported from Germany, where they are said to be successfully in operation on a suburban railway running from Berlin. No figures are at hand as to cost of operation in comparison with steam or horse power. If the device is all that is claimed, it may work a revolution in the propulsion of street cars. So far, however, as the dispensing with the use of horses is concerned, the cable system has already made that possible.

OSCILLATION OF CHIMNEYS.—The amplitude of the oscillation of chimneys has been exactly measured by observation of the shadow cast by the sun upon the ground. Recently, the oscillations of a chimney 115 feet high and four feet in diameter externally at the top, near Marseilles, France, were observed by the shadow during a high wind to attain a maximum of 20 inches. It was estimated that the chimney, deflected by an initial impulse, would have made four or five oscillations before returning to a state of rest. On the contrary, by a succession of impulses isochronous with the oscillations, a chimney may finally be overthrown. Such is the explanation of the destruction of certain chimneys, in which, nevertheless, all the conditions of statical stability were fulfilled.

NECTAR-SECRETING PLANT LICE.—Oregon seems to be the place, of all others, for nectar-secreting plant lice. During the past fall, says a correspondent of *Science*, I received sprigs of spruce and willow from Oregon, which, though not more than six inches long, contained at least a tablespoonful of crystallized sugar, which was both sweet and pleasant. The insect which deposits this nectar is a species of aphid, and though possibly not equal to the bee, or to the manufacturer of our best cone-sugar, in her power to form an excellent article of sugar does greatly surpass the glucose factories in the quality of the product she turns out.

THE LATEST PHOTOGRAPHIC DISCOVERY.—With a lens made of rock salt, it may be possible to photograph in the dark! The *Photographic News* states that Ahney has succeeded in preparing plates which are sensitive to the rays lying beyond the red end of the spectrum, the dark heat rays, and with such plates used with a rock salt lens there should be a possibility of photographing bodies which possess a high temperature, although that temperature may be far below that needed to render them self-luminous.

Passing Events.

There is nothing of special moment to record from the mining regions, aside from the fact that there is unusual activity in the gold mining sections. The low price of lead and copper and the uncertainty on the silver question, are important factors in this increase of interest in gold properties. It is not confined to this State, though, as the principal gold producer, we will reap the greatest benefit in California. Our mining industry here is at present rather prosperous and any increase of demand for gold mines will give our miners a better chance than ever to make money.

The newly discovered district in Monterey county has not so far shown any developments to warrant much excitement.

Some attention is being given to mines in Fresno county again, and it is stated that San Francisco capital is being invested there.

Columbus district, Nevada, is again looking up. The new mill just started will greatly help the miners in that camp.

THE White Pine News says an important strike has been made in the Argus mine. This is encouraging news for the camp, as it shows conclusively that the mines of the district are not "blanket ledges," as supposed, but are liable to reach to great depth.

Inspecting Hoisting Cables.

The question of inspection of hoisting cables is an important one to miners. It is evidently the prevailing practice, at least in theory, to inspect cables daily. In large mines a special ropeman is generally employed, whose duty it is to keep constant watch of the cables in use, except when actually engaged in repairing spare cables. Instances where cables are not properly inspected are comparatively few. The miners are sufficiently awake to their own interest in most cases to see that this duty is thoroughly performed, and no mine can afford to acquire the reputation of neglecting its hoisting apparatus.

It might at first sight appear to be safer to throw out cables which showed signs of wear and put in fresh ones, and this method is actually practiced to some extent with fiber ropes and small steel cables. With heavy cables, however, such a course would be ruinously expensive, and there would be a strong tendency to delay renewal too long. Flat cables, in particular, can be easily and thoroughly repaired by splicing in new strands or sections. Cables wear most at certain points, especially where they rest upon the sheave when the cage stands at a station.

During the investigations carried on by the census officials, this question of cable inspection was examined. Reports were received from various mines in all the mining States and Territories. The results are tabulated, and a recapitulation of the statistics will be of interest. This recapitulation is as follows:

	Number of Mines.
Inspected constantly.....	18
Inspected twice a day.....	2
Inspected daily.....	201
Inspected tri-weekly.....	1
Inspected "every day or two".....	1
Inspected semi-weekly.....	4
Inspected weekly.....	13
Inspected weekly when cable is new, daily when old.....	1
Inspected irregularly, occasionally or seldom.....	22
Inspected every two months.....	1
Inspected semi-annually.....	1
Total number of mines reporting inspection of any kind.....	270
Mines reporting no inspection.....	18
Mines using cables, etc., from which there are no returns.....	132
Total number reports.....	420

Practical Hydraulics.

In this number of the PRESS, in the article on "Practical Hydraulics," is applied the principle demonstrated in our last number with respect to the least weight and consequent least cost of an inverted siphon discharging a given quality of water.

The example taken, namely "Ex. 91," differs not materially from that occurring in a project of supplying San Francisco with water from a mountain source.

A comparison of the results of the two solutions given of this example shows, that when the hydraulic head is made 407.34 feet as determined by the application of this principle, the cost of the inverted siphon will be \$1,795,713 less than when the full hydraulic head of 950 feet is employed. In other words the saving amounts to over 11 per cent.

"There will in fact," says the author, "be a greater saving in practice, arising from a less length of pipe under pressure, in case of employing the smaller head."

This principle appears to have escaped the observation of authors on hydraulics prior to its demonstration and enunciation by Mr. Randall. The solution of the problem of minimum weight and consequent minimum cost of an inverted siphon, requires as seen by the discussion the application of the higher mathematics which, to a portion of the readers of the PRESS, may seem forbidding, but by engineers will be appreciated. To meet the requirements of all classes Mr. Randall, pursuing the plan adopted throughout the preparation of the work "Practical Hydraulics," now being published in the PRESS, has from the results of the solution of this most important problem, written out simple rules which anyone familiar with the four fundamental rules of common arithmetic can readily apply. There are hundreds of cases where this principle can be applied all over the State.

We would further call attention to his discussion of the "Flow of Water in Open Channels and Natural Streams" and "The Most Appropriate Form of a Canal"—that is the form of the greatest carrying capacity.

Rules and practical application will be given in our next number.

Study of Mining at Our University.

The College of Mining at the University of California is designed for students who wish to become mining or metallurgical engineers, or to engage in one of the many pursuits connected with the mining industry, such as the surveying or mapping of mines, assaying and working of ores, designing and use of mining or metallurgical machinery, or the exploitation of mines. For the undergraduate course certain preliminary examinations are necessary, and it generally takes four years to complete. During the first two years considerable time is devoted to language studies. Preliminary to the purely technical studies of the course the student receives a sufficient training in those branches of modern physical science which lie at the basis of all the industries connected with mining: on the one hand, mathematics and its application, and on the other chemistry and its allied branches.

The mathematical studies are pursued with special reference to subsequent practical applications in surveying, physics and analytic mechanics, which in their turn serve as a means for discussing such subjects as strength of materials and hydraulics. A similar sequence is observed with other studies; thus descriptive geometry is connected with work in the drawing-room, surveying with extensive field practice and the mapping of surveys actually made by the student, physics with physical problems and work in the physical laboratory, strength of materials and hydraulics with original designs in the drawing-room, followed by working tests in the mechanical laboratory. This important series of studies extends through the whole four years' course.

The studies in chemistry and allied branches begin with general experimental chemistry, inorganic and organic, followed by analytical chemistry as an application, viz., qualitative, quantitative and blowpipe analysis, subjects indispensable to subsequent work in metallurgy and assaying. Having acquired a working power in chemistry, the student begins the study of mineralogy, which is developed with special reference to its bearing on mining, and is followed by a course in geology.

The technical branches of mining, metallurgy and assaying peculiar to this college are taken up in the senior year, when the student has sufficient training in the collateral branches to study them with profit.

The courses in mining and metallurgy are illustrated throughout by maps, plans, drawings, and sketches of mines, furnaces, etc., together with actual working results whenever possible. The illustrations and references are drawn from typical mines and reduction works in operation in California and Nevada, so that the vacation trips of the student may be made more directly useful to him. In order that the student may have a ready means of following up any subject for himself, constant reference for details is made to the best technical standard and current literature in English, French and German works.

In the course in metallurgy, after the general consideration of the subjects which concern the treatment of all the metals, the rest of the undergraduate course is devoted to a thoroughly detailed study of all the important methods in use for the reduction of the ores of lead, silver, gold and quicksilver. These metals have been selected as most intimately connected with the California industries, and in order to give them the prominence which their importance demands, the treatment of the other metals has been reserved for the graduate course.

In assaying, the treatment of each metal is explained by lecture, following which, the student is required to work the metal in the laboratory, and to obtain accurate results before another is treated. For this purpose, parcels of from 500 to 1,000 pounds of ore will be assigned to students, who will be required to crush, sample, assay or analyze the samples and determine the best method of treatment, and then work the ore under proper supervision, and determine the yield and the nature, amount and causes of loss. Since the wet methods are discussed in the quantitative laboratory, most attention is paid to fire assays. Throughout the course students are advised to spend their vacations in examining typical mines and smelting works in various parts of the State.

An arrangement is made so that special students who may not be able to take the full

undergraduate course may attend such classes in mining, metallurgy and analogy, or they may be prepared to enter in accordance with the provisions of the joint regulations of the faculties at Berkeley.

Those who wish to pursue advanced or special work after graduating have every facility the libraries, collections and laboratories offer. Candidates for the professional degrees in this college must satisfy the following conditions:

To obtain the degree of mining engineer he must be a graduate of the college of mining at the University of California, or he must give evidence satisfactory to the faculty of having successfully pursued a course of study equivalent to its regular undergraduate course. He must also pass a satisfactory examination in the following subjects: Mining, ore dressing, petrography, economic geology, thermodynamics (elements), drawing and construction of mining machinery, blowpipe assaying, and political economy. He must have had at least one year of actual practice in the field in the course chosen, and must show by an original memoir upon some subject bearing upon this profession his power to apply his knowledge to practice. This degree will not be given earlier than three years after graduation.

A candidate for the degree of metallurgical engineer must pass an examination in the following subjects: Metallurgy, ore dressing, assaying and analysis, blowpipe assaying, thermodynamics (elements), drawing and construction of furnaces and metallurgical machinery, and political economy. In all other respects the conditions are the same as those required for the degree of mining engineer.

Improving the Quality of Water.

Those who obtain their water supply through cisterns, reservoirs, etc., will be interested in the suggestions made by the expert employed by the Oakland City Council on the possibility of improving the quality of the city water. Mr. L. J. Le Conte, the engineer in question, after calling attention to the occasionally unpleasant odor of the Oakland water, says that while this may not be unhealthy, it is nevertheless unpleasant. He says that Oakland, like San Francisco, is dependent for its supply chiefly on surface waters impounded in reservoirs during the rainy season. All such fresh water lakes are more or less subject to vexatious contaminations, due principally to the decomposition of some variety of *algae*. Whether these organisms give rise to unwholesome conditions is an open question. The Massachusetts State Board of Health say on this point, "that the plant acted mechanically chiefly, perhaps like unripe fruit, when affecting the health at all, in causing diarrhea, but that the filtered water is harmless." However true this may be, the fact remains that they give a repulsive appearance to the water, and, under certain conditions, impart to it a very offensive taste and odor. As to the remedy, there is absolutely no preventive known for these troublesome contaminations.

The experience at Baltimore is in brief as follows:

First—"The facts go to show that the products of decaying vegetation sink to the lower water in deep reservoirs, where decomposition is suspended for want of oxygen; the gases are absorbed by the water, which, upon contact with the air, are fully oxydized."

Second—"As a preventive, surplus waters should be wasted from the bottom of the reservoirs, and not over the waste weirs."

Third—"As a cure, aeration by means of shallow distributing reservoirs, receiving the water on the surface, and, if possible, from fountains."

This seems to show that a large proportion of the bad odors and tastes may be directly traced to stagnated waters in the lower reaches. Mr. Le Conte suggests that in the Contra Costa reservoirs the storm waters should be wasted chiefly through the bottom outlet, so the bottom waters should be allowed to run to waste occasionally. As to muddy waters, the only remedy is a system of capacious settling reservoirs.

WORKS and machinery to the value of \$100,000 will be employed in developing the recently discovered coal mine at Elsinore, San Diego county.

GEN. THOMAS H. WILLIAMS, well known as a mining man of considerable wealth, died last week.

Working Drift Mines.

A number of mines in this State, formerly worked by the hydraulic process, are now being worked by "drifting." In the Mint Director's report, Mr. Walter A. Skidmore contributes a chapter on gold and silver mining in this State, in which the method of working drift mines is well described.

The method of extracting gravel in drift mines is in many respects similar to that pursued in coal mining. A shaft or slope is sunk, or a tunnel run, if the nature of the ground will permit. When the pay gravel is reached it is cross cut from rim to rim and gangways are run at right angles, laying off the ground in blocks. These are called breasts. The main tunnel is always carried well ahead of the gangways. Pillars are left to support the main tunnel, which follows as near as practicable the gutter of the channel. The breasts are supported by temporary posts and by the "stacking" of the larger boulders. As breast after breast is worked the ground is abandoned and left to settle. Tunnels are sometimes run too low or too high; in the latter event the work must be commenced anew and at a more favorable point. If too low, an upraise shaft is raised until the gravel is tapped, when a main gallery is run above the tunnel bed, and the ground worked as above described, the gravel being dropped to the main tunnel by chutes.

In the accompanying diagram of a drift mine the main tunnel runs through the center and the gangways diverge on either side until the rim or limit of pay is reached. The main gallery or tunnel is usually 10 or 12 feet on bottom, 8 or 9 feet high, and 3 to 4 feet wide on the top; while the breasts are from 3 to 5 feet in height. Hence the area covered by the gallery and gangways bears a proportion in cubic contents to the whole ground worked.

Drift mines are rarely worked by perpendicular shaft, as the method is both inconvenient and expensive. Shafts are sunk to the bed-rock for exploratory purposes. When by means of drifts in various directions the extent and apparent course of the channel is determined, a tunnel is run if practicable. Some of these tunnels have been run a distance of 1 mile through the rim-rock before the channel has been struck, but this is never done unless a prospecting shaft or a neighboring tunnel has demonstrated the existence and value of the channel.

Where a tunnel is not practicable, or where a tunnel having been run a lower channel has been found below its grade, the ground is opened by incline or slope. Many effective and original devices are used for hauling up the loaded cars and providing ventilation. At the Bald Mountain Extension mine of Forest City, Sierra county, the incline is 260 feet in length with a pitch of 1 foot in 4, making the perpendicular rise 65 feet. The upper part of the incline, for a little more than half the length, has a double track; at the junction of the single and double tracks there is an automatic switch which is set by the descending loaded cars. The drum is two feet in diameter, and is 25 feet from the head of the incline. Two steel ropes, half an inch in diameter and each 300 feet long, are used, unwinding from the center of the drum towards the ends. The break used is an ordinary strap break, having a compound lever attachment, making it automatic to the extent that it will by its own weight hold two loaded cars on the incline. The whole outfit worked smoothly from the start, two loaded cars being lowered in about 30 seconds. The double shaft through which gravel was at first taken out has been utilized by placing in one of the compartments an air-blast. The air, which comes in through 6000 feet of 11-inch pipe, is taken by this air-blast down the 60-foot shaft and forced up and into the drifts and tunnels, bringing the works, so far as ventilation is concerned, for an indefinite period within the last-mentioned distance from the outer air.

A writer in the Downieville Messenger, who is evidently a practical drift miner, makes the following pertinent suggestions with respect to the future of this interest:

"In no other branch of mining has so little improvement been made upon the original and primitive methods as in drift gravel mining. It is true that in a few instances, notably in the

Bald Mountain mine, in this county, machinery is being used to cheapen and expedite the extraction of gold-bearing gravel, but with one or two exceptions the manner of working is substantially the same that it was almost in the beginning of the industry. In later days the tunnel is somewhat larger and less sinuous. The timbering is more substantial. It is usual now to use posts from 10 to 20 inches in diameter, and for special purposes a diameter of two feet is not uncommon. Caps range from 12 inches upward. The original method of making a nearly square tunnel has long been abandoned in the larger mines, and the custom now is to make the main tunnels at least 7 feet on the bottom, 6½ to 7 feet high, by 3½ feet at the top—all these measurements 'in the clear' or inside the timbers. A cross-section of a modern mining tunnel would thus present the appearance of a perpendicularly bisected truncated pyramid. The object of thus placing the posts is to prevent that rapid crowding in at the bottom in soft ground, which with a post set perpendicularly would ensue, entailing delay and ex-

Mining Accidents.

A miner named John Mitchell fell down the shaft at the Bunker Hill mine, near Amador City, one day last week and was badly hurt about the head, but the wound is not considered dangerous.

Richard Phillips, a Cornish miner, working in the Live Oak mine, at Soulsbyville, Tuolumne county, was severely injured by a piece of rock falling from above and striking him in the small of the back. The wounded man is in a critical condition.

Richard Hale was caved on in the Baltimore mine and received such injuries as proved fatal. He was at work in a tunnel when without a moment's warning the top seemed to fall and, knocking him over against the wall, the debris held him fast. His head and shoulders were not covered and it was hoped at first to get him out in a short time. Word, however, of the accident was sent to town and a number went out and joined in the work of rescuing him. As fast as the loose dirt and stones were shoveled

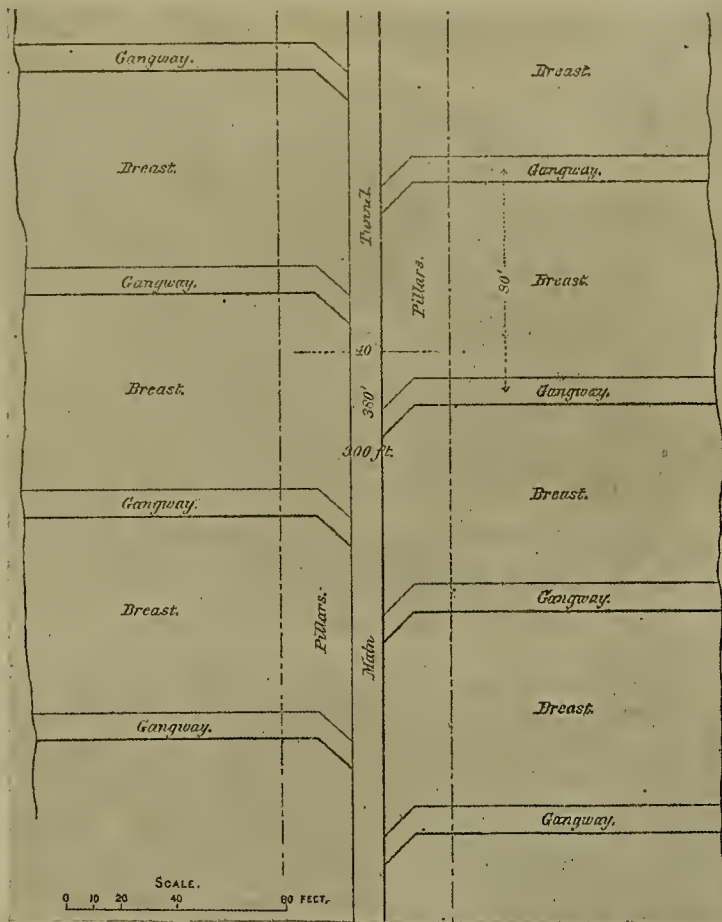

DIAGRAM SHOWING METHOD OF WORKING DRIFT MINES.

pense for repairs. Of late years, T-rail has come largely into use in mining tunnels. This rail is either steel or iron varying in weight from 16 pounds to the yard and upward for the former to from 24 to 42 pounds to the yard for the latter. The advantages of this rail over the strap rail laid on wooden stringers are numerous and essential. While the first cost is more, the wear upon wheels and car bodies is infinitely less, and the ease with which a car is moved is much greater. Another advantage is that in swelling ground this rail rises in long swells instead of sharp hummocks, the advantages of which in tunnels of moderate gradients are obvious. In the 'car' there have been some minor improvements, but that vehicle is substantially the same, being a box upon four wheels. From holding less than half a cubic yard, it has grown to hold a full cubic yard, weighing with its contents, when full, about 4000 pounds. Instead of wheels loose upon the axles, they are rigid, and the axles of steel turn in babbitted self-oiling boxes. Instead of the car being pushed by hand, mules are now used where the distance is great, each animal taking a train of eight cars, more or less, depending upon the gradients to be overcome. The foregoing are, in brief, the more important changes that have taken place in the evolution of drift gravel mining. In the economy of drift mining no inconsiderable expense attaches to moving the gravel from the inside of the mine to the dump."

back more fell down to take their place, and the rescuers soon found that they had no trifling job ahead of them. A general alarm was given and one or two hundred people in all went out to the mine in hopes of being able to render some assistance. A few practical miners, however, took the work in hand, and by putting in new timbers and working carefully and skillfully they finally succeeded in about seven and a-half hours after the accident, in bringing the unfortunate man out to the light of day. He suffered some pain, but no bones were fractured, and it was the general belief when they got him out he was not seriously injured. He was brought in and made as comfortable as possible. Towards morning, however, his pain seemed to grow less, and by 6 o'clock he was a corpse.

On Monday morning last the body of Frank Agnew was discovered by one of the employees revolving around a shaft at the Douglass mill, Dayton, Nev. The machinery was stopped and the body extricated, dead. How long it had been in that position is unknown. It evidently had caught in the machinery. The body was badly lacerated, the left leg being completely torn off at the knee.

The Granite Mountain mine, Montana, shipped in 1885 a total of 1059 bars of bullion, weighing 1,096,731 ounces fine silver, the estimated value being \$1,146,000, the proceeds in hand, all charges for freight and refining off, amounting to \$1,102,750.

A State Lottery.

California ought to have a lottery of its own, managed by a board of commissioners. There is nothing honest, decent, moral or improving in a lottery, but still this State should run one. There is everything dishonest, indecent, immoral and debasing in a State lottery, but still the State should have one of its own. Deal with things as they actually are and not with things as they should be. This State lottery should be established and conducted for the purpose of keeping at home the money now sent to New Orleans by the people of this State. That money has made the New Orleans managers very rich, enabling them to fly high at Saratoga and other watering places, and they build villas in many pleasant locations. California money ought to be given to California lottery managers. Some of our ex-State officers, whom juries pronounced innocent when said officers were tried for taking State mousy, would make excellent lottery directors. Very many California people do send their money away to the Louisiana concern, and this State should open a hogging game of its own to accommodate the gambling propensities of the good people here. An amendment, which permits lotteries in this State, should be made to our State constitution.—*Grass Valley Tidings.*

Yes; by all means, have a Golden State lottery. Advertisements in first-class daily papers show that Louisiana lotteries are capping us for a harvest. California has neglected her duty towards that great class of her citizens who forever want "something for nothing"—had rather receive \$1 without giving an equivalent than \$2 by honest enterprise.

California suffered once from the Mercantile Library lottery. No more demoralizing event ever occurred in the community. The lesson taught by that should be sufficient. Business was upset in San Francisco and the interior for weeks, and the "season" finally culminated in a three days' vacation at the metropolis. Thousands were ruined in finances and thousands more suffered in health, morals and industry. What mattered it that a good divine opened the ceremonies with prayer at the drawing of prizes in the Mechanics' pavilion, nearly 18 years ago, and that the president, treasurer, agent and several of the directors were of standing in the community and moral—not to say religious—men. They were all prominent and leading business men, yet the example set by them was demoralizing in the extreme. That few of them have since prospered, or are now with us, may not be a result of that grand money-making scheme, but it is a significant fact. It is true, this was not for the benefit of an individual, but of an association, and the association itself has not prospered from its ill-gotten gains.

BULLION HILL.—An "Old-Timer" writes us from Bullion Hill, Cortez, Nev., that all the mines are looking well and there are only four dead-heads on the hill. They have been lying idle for nearly a year trying to sell a little hunch of ore between two rocks, which is now in litigation. Our correspondent thinks they are not only injuring themselves, but every mine owner in the hill. The miners there that own good properties are not calling on capitalists to help them. They have an abundance of high-grade ore near the surface, which has paid the miners well for the past 20 years for their labor and will last for years to come. If many of the mines were in the hands of capitalists there would be thousands of dollars every month taken out of Bullion Hill, where the miners are now enabled to take out only a few hundred.

DEATH OF A WELL-KNOWN FOUNDRYMAN.—Thornton Thompson, proprietor of the Eureka Foundry, on Beale street, got off one of the cars of the Howard street line at Twenty-sixth street Tuesday afternoon, walked along that street toward his home at 2932 Folsom street, but before he reached Shotwell street he fell. He was carried at once to his house and physicians were summoned, but when they arrived he was dead. The physicians declared that he died of heart disease. The deceased was a native of New Jersey, 52 years old.

ANOTHER rich strike in the Ida gold mine at Lost Basin, 60 miles northeast of Hackberry, A. T., is causing considerable excitement, and prospecting outfits are leaving here daily for the new gold fields.

POLITENESS could not be carried further than it is at a certain coal mine in Dudley, where a notice warns all and sundry in the following terms: "Please do not fall down the shaft."

PRACTICAL HYDRAULICS.*

NUMBER 20. COPYRIGHTED.

PRINCIPLES OF HYDRAULICS.

[Written for MINING AND SCIENTIFIC PRESS by P. M. RANDALL.]

TO FIND THE MINIMUM MEAN THICKNESS.

Rule 50.—Multiply the fifth root of the product of the coefficient of resistance, the length of the pipe, the square of the discharge per second, and the fourth power of the mean hydrostatic ordinate, O A, Fig. 20, by the quotient arising from dividing 2.5908 by the modulus of the working load or of safety, as shall be required.

Rule 50 corresponds to Eq. (205).

TO FIND THE MINIMUM WEIGHT.

Rule 51.—Case 1.—The pipe being very thin, multiply the fifth root of the product of the square of the coefficient of resistance, the seventh power of the length of the pipe, the fourth power of the discharge per second, and the cube of the mean hydrostatic ordinate, O A, Fig. 20, by the quotient arising from dividing .4046 times the weight of a cubic foot of the material in the pipe by the modulus of the material.

Case 2.—The pipe being thick as $\frac{3}{16}$ of an inch or more, and seamless, multiply the result obtained, according to Case 1, by 1 (unit), increased by the quotient arising from dividing the thickness of the shell by the inner diameter.

Case 3.—The pipe being thick, as $\frac{3}{16}$ of an inch or more, and constructed with rivets and laps or bands, multiply the result obtained, according to Case 2, by 1 (unit), increased by their relative weight to that of the pipe.

Rule 51 corresponds to Eq. (211).

The moduli with respect to the strength, working load, and safety are given in Table 23.

The modulus of working load, as shown in Ex. 90, is $k=17,549$ pounds.

Unless the iron is extra in quality, the modulus ought to be less, as $k=14,000$.

The weight of a cubic foot of iron is usually estimated at 480 pounds.

TABLE 24.

Number, Thickness and Weight of One Square Foot of Sheet Iron.

Ex. 91.—The following data from a sheet-iron inverted siphon being given, viz:

Length of pipe, 128.5 miles.

Elevations with respect to sea level:
Point of inlet, 1300 feet.
Point of outlet, 350 feet.

Mean hydrostatic ordinate, as O A, Fig. 20, 305.5 feet; discharge of water per second, 37.57 cubic feet; modulus of safety of the iron, 14,000 pounds; weight of iron per cubic foot, 485 pounds; allowance for bands, laps and rivets, 15 per cent; cost of laid pipe per pound, 10 cents. Required, the minimum diameter, thickness of shell, weight and cost of the siphon? Required, also, the diameter, thickness of shell, weight and cost of the siphon, if 950 feet, the full hydraulic head, be employed?

Qul. 1st. The given hydrostatic ordinate is 305.5 feet.

By Rule 46, corresponding to Eq. (198), $305.5 \times 4 \div 3 = 407.34$ hydraulic head; $407.34 \div 128.5 = 3.17$ feet fall per mile.

By Table 17, it is seen that for 3.17 feet fall per mile, the pipe carrying 37.57 cubic feet per second will approximate 48 inches in diameter, and that the corresponding velocity is 3.20 feet per second.

By Table 16, for a velocity of 3 feet in a 48-inch pipe, the coefficient of resistance is=.0038.

By Rule 49, corresponding to Eq. (204),

$.5965 \left(\frac{.0038 \times 128.5 \times 5280 \times (37.57)^2}{305.5} \right)^{\frac{1}{5}} = 3.898$ feet = 46.776 inches, minimum diameter (internal).—Ans.

By Rule 50, corresponding to Eq. (205),

$\frac{2.5908}{14000} \left(.0038 \times 128.5 \times 5280 \times (305.5)^4 \right)^{\frac{1}{5}} = .3694$ inches in thickness.—Ans.

By Rule 51, corresponding to Eq. (211),

$\frac{.4046 \times 485}{14000} \left\{ (.0038)^2 (128.5 \times 5280)^7 (37.57)^4 (305.5)^3 \right\}^{\frac{1}{5}} (1 + \frac{.3694}{.48}) \times 1.15 = 143790750$ pounds, minimum weight.—Ans.

Whence at 10c. per pound: Cost=\$14,379,075.00.—Ans.

Cul. 2.—1300—350=950 feet total head; $950 \div 128.5 = 7.392$ feet fall per mile.

By Table 17, the diameter of pipe having 7.392 feet fall per mile, and discharge 37.57 cubic feet of water per second is=40 inches.

By Rule 47, corresponding to Eq. (190), $(305.5 \times 2 + 950) \div 2 = 780.5$ feet mean ordinate for the entire pipe.

By Rule 43, corresponding to Eq. (187), $780.5 \times .434 = 338.737$ mean ordinate in pounds for the entire pipe.

By Rule 44, corresponding to Eq. (188), $338.737 \times 20 \div 14000 = .4839$ inches thickness of pipe; $40 \times 3.1416 \div 12 = 10.472$ feet circumference of pipe; $10.472 \times 128.5 \times 5280 \times .485 \times .4839 \div 12 = 138954840$ pounds weight of pipe, assumed seamless, and estimated for the internal diameter.

By Rule 51, corresponding to Eq. (211), cases 2 and 3, $138954840 (1 + \frac{.4839}{.48}) \times 1.15 = 161,747,880$ pounds weight of pipe, employing the full head of 950 feet.—Ans.

Whence, at 10c. per pound: Cost=\$16,174,788.00.—Ans.

The difference in these results, viz., \$16,174,788.00—\$14,379,075.00=\$1,795,713.00, which amounts to a saving of over 11 per cent by the application of the principle hereinbefore demonstrated with respect to the minimum weight and minimum cost of an inverted siphon.

There will, in fact, be a greater saving in practice, arising from a less length of pipe under pressure, in case of employing the smaller head.

FLOW OF WATER IN OPEN CHANNELS AND NATURAL STREAMS.

The flow of water in open channels and natural streams is subject to the same laws which govern its flow in pipes. The force producing motion in the water, and overcoming the resistances of the water way, is that of gravity applied to an inclined plane. A greater variety of forms, with respect to cross section of streams, is presented in open channels and natural streams than in pipes, thereby changing to a greater extent the relations between the perimeters and the areas of the cross sections of the former, than of the latter. Thus, in the case of pipes, the "hydraulic mean radius" has been shown, uniformly, equal to one-fourth of the diameter, while in open channels their mean depths vary indefinitely.

The "mean depth" of an open channel or natural stream is the ratio of the perimeter to the area of the cross section of the stream. For the most part in hydraulic computations, that portion of the perimeter which bounds the bottom and sides of this area, termed the "wet perimeter," is employed.

The "air perimeter," whose value does not often exceed one-tenth of an equal length of the wet perimeter, unless strong winds or other disturbing influences obtain, is considered when great accuracy is required:

Let a =area of cross section of stream;

p =wet perimeter;

$m p$ =air perimeter;

m =coefficient of air perimeter;

r =hydraulic mean depth.

$$\text{Then } r = \frac{a}{p} \quad (212)$$

$$r = \frac{a}{p + m p} \quad (213)$$

Other things being equal, the greater the ratio of the perimeter to the area of the cross section of a stream of water, the less will be the resistance to flow.

The forms of cross sections, generally applied to water ways, are rectangular and trapezoidal.

FORM OF RECTANGLE OF MAXIMUM CARRYING CAPACITY.

Let p =perimeter (omitting air perimeter);

x =height of rectangle; *

Then $p-2x$ =width of rectangle.

$$\frac{px-2x^2}{p} = \frac{p}{4} = r, \text{ maximum.} \quad (214)$$

$$\text{Differentiating (214), } x = \frac{p}{4}, \text{ height.} \quad (215)$$

$$p-2x = \frac{2p}{4}, \text{ width.} \quad (216)$$

FORM OF TRAPEZOID OF REGULAR FIGURE OF MAXIMUM CARRYING CAPACITY.

In Fig. 21, let t =BAE, angle of slope of bank; $\frac{2}{3}$ =a side; then height= $\frac{2}{3} \sin t$. Mean width= $\frac{2}{3} + \frac{2}{3} \cos t$.

$$\frac{p^2}{9} (\sin t + \sin t \cos t) = r \text{ maximum.} \quad (217)$$

Differentiating (217), observing that $\sin^2 t = 1 - \cos^2 t$,

$$\cos^2 t + \frac{\cos t}{2} = \frac{1}{2}. \quad (218)$$

$$\text{Reducing (218), } \cos t = \frac{1}{2} = .5. \quad (219)$$

$$\text{By Table natural sines, } t = 60^\circ. \quad (220)$$

Of the regular figures, the semi-circle consisting of an infinite number of sides, so that at any point $\cos t = 1 = R$, offers the least resistance to flow.

By equations (215) and (216), it is seen that the form of a rectangle, offering the least resistance to flow, has its base or width equal to twice its height; and by equations (219) and (220), it is seen that of the regular figures, the trapezoid whose angle of slope is 60° , in other words the semi-hexagon, offers the least resistance to flow.

THE ANGLE OF SLOPE AND THE AREA BEING GIVEN TO DETERMINE THE MOST APPROPRIATE FORM OF A CANAL.

Let in Fig. 21, p =A B + B C + C D=perimeter; b =B C=bottom; t =angle A; n =cot t ; a =area; x =d=B E, depth of canal.

$$\text{Then } A E = n x; \quad (221)$$

$$A B = x(1 + n^2)^{\frac{1}{2}}; \quad (222)$$

$$p = b + 2x(1 + n^2)^{\frac{1}{2}}; \quad (223)$$

$$a = (b + n x) x; \quad (224)$$

$$\text{whence } b = \frac{a - n x^2}{x} \quad (225)$$

Substituting value of b of (225) in (223) and dividing then both members by a ,

$$\frac{p}{a} = \frac{1}{x} + \frac{x}{a} \left\{ (1 + n^2)^{\frac{1}{2}} - n \right\} \text{ minimum.} \quad (226)$$

Differentiating (226) and reducing,

$$x = \left\{ \frac{a}{2(1 + n^2)^{\frac{1}{2}} - n} \right\}^{\frac{1}{2}}. \quad (227)$$

Substituting the values of $n = \cot t = \frac{\cos t}{\sin t}$ and $(1 + n^2)^{\frac{1}{2}} = \frac{1}{\sin t}$ in (227),

$$x = \left\{ \frac{a \sin t}{2 - \cos t} \right\}^{\frac{1}{2}}. \quad (228)$$

$$\text{From (225) } b = \frac{a}{x} - x \cot t. \quad (229)$$

TABLE 25.

Dimensions of the most suitable forms of Canals, corresponding to different angles of slopes, and to a given area of cross section.

Angle of Slope=t.	Ratio of Per. to Base.	Relative Slope. n.	Depth. $\frac{d}{1}$	Bottom Width. $\frac{b}{1}$	$\frac{n d}{1}$	Top Width. $\frac{b + 2 n d}{1}$	Perimeter. $\frac{p}{1}$

Notices of Recent Patents.

Among the patents recently obtained through Doney & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

TRACK-CLEAKER FOR MOWERS.—James M. Patterson and Eli A. Hinebanch, Tipton, Tulare Co. No. 335,769. This improvement in mowing machines consists particularly in the employment of vertical reciprocating sickles or cutters operating at the end of the horizontal finger-bar and in line with the track-cleaver, of a novel construction of these vertical cutters, a means by which they are actuated, and in certain details of construction.

DESIGN FOR CHEEK-PIECE FOR BRIDLE BITS.—Jose M. Espinosa, S. F., assignor to Wm. Davis. No. 16,521. Dated February 16, 1886. This invention relates to a design for the cheek or side pieces of a bit, the essential feature of which is the figure of a running or rearing horse, having rings or loops formed integral. The outer surface of the piece has lines of ornamentation upon it indicating or delineating the various features of a horse—such as the eye, nostril, mouth, mane, etc.

ELECTRIC TRUSS PAD.—Andrew T. Sherwood, S. F. No. 335,639. Dated Feb. 9, 1886. This is an elastic truss pad, combined with a galvanic battery, whereby the advantages of an electrical current are combined with the advantages to be derived from an elastic truss-pad, as distinguished from a hard or solid pad. The invention covers the particular means employed for connecting the poles of the battery through an elastic pad with the battery, whereby the elastic quality of this pad is not impaired or interfered with.

STAVE-JOINTING ATTACHMENTS FOR MOLDING MACHINES.—A. M. Jewell, S. F. No. 335,756. Dated Feb. 9, 1886. The invention consists in a pressure mechanism acting constantly against the sectionally-moving cutter head arbor and adapted to hold the guiding disk of the cutter-head to a positive engagement or contact with the pattern, whereby said head is caused to form or joint the stave. The object of the invention is to adapt by simple and effective means a molding machine for the purpose of joining or making staves.

FRUIT JAR FASTENING.—Georgs V. Henrie, S. F. Assignor of one-half to Martin V. B. Watson. No. 335,754. Dated Feb. 9, 1886. The invention relates to that class of fruit jar fastenings in which a wire nail hinged at one end to the neck-wire passes over the top of the jar and is fastened to and disconnected from the neck wire by a thumb piece or lever. The invention consists in a novel connection between the lever and neck-wire, and between said lever and the nail wire, whereby the latter may be readily engaged and disengaged. It further consists of an improved loop for securing and lightening the ends of the neck-wire and in a means for applying a greater or less pressure to the cover as may be required.

ELECTRIC BELT AND TRUSS.—A. T. Sherwood, S. F. No. 335,638. Dated Feb. 9, 1886. In a former patent of the same inventor is described an electric truss pad combined with a galvanic battery which formed an integral part of the pad. In this invention, however, is contemplated the employment of an independent electric belt, such as is used for therapeutical purposes, in connection with a truss pad and belt, and so combining and connecting the two that the electric current generated in the battery of the electric belt is passed through the truss pad and used for an adjunct for healing rupture. These belts are independent of each other, so that either can be worn separately; or when desired, they can be connected so as to act conjointly.

MACHINE FOR MAKING THREAD ON SHEET METAL PIPES.—F. F. Voigt, Walla Walla, W. T. No. 335,727. Dated Feb. 9, 1886. The object of the invention is to prepare for jointing such metal pipes as are made in sections, and are then put together to the required length, such as conducting water pipes and common water pipes or such as are used in leading water and draining, and stovepipes and smokestacks of smaller sizes. By the use of this invention the putting together or jointing of such pipes is rendered more easy, and when so put together they will stay without being tied with wire, or being riveted together or otherwise secured, it still being easy to separate the several sections and parts when necessary.

VOLTAIC BELT.—Andrew T. Sherwood, S. F. No. 335,637. Dated Feb. 9, 1886. This improvement in electric belts related, first, to an improved manner of constructing and combining the plates of different metals, such as zinc and copper, and the interlying fibrous substance, which compose the separate elements of a voltaic battery, and the manner of connecting these elements together, so as to form a battery, which is capable of generating an electric current for therapeutical purposes; and, secondly, by the covering belt, which supports and envelopes the batteries, to protect the clothing of the wearer from being soiled by the exciting liquid which is used for saturating the fibrous material. It also consists in a means for connecting the ends of the belt and in certain details of construction.

USEFUL INFORMATION.

DRY ROT.—A rather singular accident recently took place in Chicago, where a four-story brick building collapsed, the whole interior falling into the cellar. The weakness of the structure was first observed by a boy, who saw a movement in the wall, and told the engineer, but was laughed at for his pains. Soon afterward, however, an alarm was raised, and all the persons in the building succeeded in escaping before it fell. The cause of the catastrophe is said to have been the dry rotting of the wooden girders, where they rested upon the posts. The building had been examined not long before, and pronounced safe, and it seems possible that the rotting of the timber may have been caused by painting it while green, and that the same coat of paint may have served to conceal the ravages of the fungus from those who inspected this work. Paint, which prevents the drying of the corruptible sap of green timber, is a common cause of decay, while the contact of the end grain of one piece with the side of another, as in the case of a girder resting on a post, is an equally common one, so that the safest way in buildings framed with such timbers is always to rest the horizontal pieces on iron caps or brackets, and to avoid painting until the work has become seasoned by years of use.—*Western Architect and Builder.*

TO DWARF A TREE.—A little white oak tree, growing in an ordinary flower-pot, makes a very pretty ornament for a window or a front yard. It is very easily grown. Select a sound white oak acorn in January or February, plant in rich earth in a flower-pot, keep it in a warm place and well watered. In the spring, the little oak will make its appearance, and will require no care, except watering, and will withstand the winter if not too exposed to hard freezes. If the tap root is cut off in the early part of the next spring it will continue to grow and put out new limbs, but will not get much taller, and by cutting back the central roots that will spring from the base of the tap root every spring, a few years will produce a diminutive little oak, a *fac simile*, in appearance, to the lord of the hard woods. Some enthusiastic lovers of nature make veritable pets of these dwarf oaks.—*Southern Lumberman.*

ROME WAS BUILT OF BRICKS—NOT MARBLE.—There is a very false notion abroad as to the richness of the materials used for building in Rome, induced by the inflated accounts of travelers and poets, who attempt to disguise their ignorance or their want of knowledge and taste, by raving of Vitruvian proportions and marble temples, palaces and baths. The truth is, that Rome was built not of marble, nor even of stone, but of brick; for in comparison to the quantity of brick, it may be safely asserted that there is more stone in London than there was in Imperial Rome. Almost all the structures of the Romans, indeed, were of brick—their aqueducts, their palaces, their villas, their baths and their temples. Of the present remains it is only a few columns, and their entablatures that are of marble or granite, and two or three buildings of travertine stone; all the rest are brick.

APPARATUS FOR DETERMINING VALUES OF LUBRICANTS.—An interesting little device for determining the values of various lubricants is described in an English paper. It was designed by Professor Hermann, and consists of a perfectly cylindrical shaft supported on two journals carried by a branched support, which so turns on a hinge that the shaft can be adjusted at an angle of 5 to 10 degrees to the horizon. The upper end of the shaft is rotated by means of a handle. To use the apparatus a bent piece of the same metal as that to which the lubricant is to be applied is placed astride of the shaft and suitably weighted, and the number of turns of the handle requisite to cause it to slide along the shaft with various lubricants are noted. The greater the distance traveled for a given number of revolutions the more efficient the lubricant.

A HOME-MADE TELEPHONE.—To make a serviceable telephone from one farmhouse to another, only requires enough wire and two cigar boxes. First select your boxes, and make a hole about half an inch in diameter in the center of the bottom of each, and then place one in each of the houses you wish to connect; then get five pounds of common iron stovepipe wire, make a loop in one end and put it through the hole in your cigar box and fasten it with a nail; then draw it tight to the other box, supporting it, when necessary, with a stout cord. You can easily run your line into the house by boring a hole through the glass. Support your boxes with slats nailed across the window, and your telephone is complete. The writer has one that is 200 yards long, and cost 45 cents, that will carry music, when the organ is playing, 30 feet away in another room.—*Ec.*

A COVER FOR COAL CARS.—A very useful device in the shape of a cover for coal cars has recently been invented. The cover, which is made of corrugated iron, is attached to the side of the car by means of substantial hinges, and when not in use hangs along the side of the car. But when the car is filled and ready for shipment the cover is easily raised up and let down over the loaded car just as you would close a double door, the two sections are then

sealed, and if anyone breaks the seal for the purpose of stealing the coal he is guilty of burglary just the same as when breaking into a house or a sealed box car. It will be observed that this device will prevent coal from rolling off, keep snow and rain out of the car, and at the same time keep the coal thief at bay.

GLUCOSE FROM OLD RAGS.—It is said that a German manufacturing firm is turning out a ton a day of glucose, made from old linen rags which are treated with sulphuric acid, which converts them into dextrine, and then into glucose. As glucose is used extensively in the manufacture of lager beer, the possibility of drinking other people's underclothes, suggested by the new process, is interesting, if not appetizing.

STAINS may be removed even from the most delicately-colored kid gloves without injury by suspending them for a day in an atmosphere of ammonia. Provide a tall glass cylinder, in the bottom of which place strong aqua ammonia. Be careful to remove from the sides of the jar any ammonia that may be splattered upon them. Suspend the gloves to the stopper in the jar. They must not come in contact with the liquid.

ARTIFICIAL MARBLE can be made by soaking plaster of Paris in a solution of alum; bake it in an oven, and then grind it to a powder. In using, mix it with water, and to produce the clouds and veins stir in any dry color you wish. This, says an exchange, will become very hard and is susceptible of a high polish.

THE BAROMETER AND MINE EXPLOSIONS.—In certain Austrian coal mines work is suspended in dangerous places during a fall of the barometer, experiments still in progress having shown that the quantity and intensity of explosive gases greatly increase as the atmospheric pressure diminishes.

ONE of the English railroad companies has supplied all its employees with red neck handkerchiefs, the wearing of which is compulsory. The object is the providing of red flags, which can be employed in the event of any sudden accident or the derangement of the regular signals.

ANY gold jewelry that an immersion in water will not injure, can be beautifully cleaned by shaking it well in a bottle nearly half full of warm soapsuds, to which a little prepared chalk has been added, and afterwards rinsing in clear, cold water, and wiping it dry.

FIRE PROOFING SHINGLES.—It is said that shingles may be made fire proof by setting the huts into a trough of water, in which a half bushel each of lime and salt, and six pounds of potash have been dissolved.

GOOD HEALTH.

Increase of Baldness.

It has been estimated, says the *New York Medical Record*, that one-half the adult men of American birth living in our cities are bald-headed. The estimate is not exaggerated, if it is applied to persons above the age of thirty, and it may be rather under the mark. If, now, it be conceded that one-half our American business and professional men are bald at the present time, it would be interesting to speculate as to the condition of the heads of their descendants some hundreds of years from now. The probabilities point towards a race of hairless Americans, for baldness is extremely liable to be propagated in the male line, and to appear a little earlier in each generation. The American nation is threatened with the catastrophe of a universal alopecia. The cause is usually imputed to the excessive strain and ceaseless mental and physical activity to which our methods of business and modes of living conduce. From the visitors' gallery of the stock exchange, for example, one views a mob of shining pates, belonging, as a rule, to rather young men.

The much neglected scalp should be thoroughly cleaned at certain intervals. It should be carefully and regularly examined, and if it be unhealthy, dry, and scurvy, the proper applications should be made to it. The wearing of unventilated hats is one of the greatest sources of failure of nutrition of the hair, and these must be avoided. The beard never falls out, because it gets plenty of sunlight and air. These are what the hair of the scalp needs also. Women are less bald than men, because, for one reason, their scalps are better ventilated. In fine, civilization has made the hair-producing organs of the scalp delicate and feeble. They have to be nursed and cared for, or they disappear. Young Americans who do not wish to lose their hair before they are forty must begin to look after their scalps before they are twenty.

CONSUMPTION IN CALIFORNIA.—The published weekly death-rate of the cities and larger towns of California show quite a large percentage of deaths from consumption. A contemporary justly remarks that these publications without proper explanations do great injustice to the State. The deaths no doubt actually occur, but the greater number of the fatal cases have their origin in the East. People with very weak lungs remove to California in the hope of escaping the disease, and numbers

in all the stages of actual attack flee to our State in the hope of being cured. These settle here with the seeds of consumption already sown; many die, and add to our death-rate a percentage which we properly should not be charged with. Authorities agree that consumption is not to be classed as a disease which finds a home here as it does in the East, and therefore to incorporate the deaths of those who come here in the search of health in our death-rate, does the State an injury unless it is explained. Those who are well posted in regard to this subject, in those Southern countries of the State, well know that a very large proportion of the consumptives who visit this State are greatly benefited by the climate there, and many who would undoubtedly find an early grave in the Northern and Eastern States receive permanent benefit in an almost if not full restoration to health. The editor of this column pays frequent visits to the counties named and is personally cognizant of many cases of restoration.

INOCULATION FOR YELLOW FEVER.—Since M. Pasteur's announcement of his discovery of a method to prevent hydrophobia by inoculation, the subject of inoculation is receiving the special attention of the medical profession of this country. A belief prevails that yellow fever can also be prevented by inoculation. Dr. Holt, of the Louisiana Board of Health, in a letter to Dr. Sternberg, surgeon of the United States army, proposes the formation of a commission to visit Brazil and Mexico for the purpose of investigating certain experiments made in these countries in the inoculation of yellow fever patients. The physicians who have been conducting these experiments are Dr. Carmona in Mexico and Dr. Freire in Brazil. Their operations, it is said, have received the approval of their respective governments, and it will be the duty of the commission to find whether that approval was properly bestowed, and to what extent. A commission of that kind, it will doubtless strike the reader, should be appointed without delay.

OIL OF MUSTARD SEED FOR RHEUMATISM.—London *Truth* tells of a gentleman, who, after suffering much from the effects of rheumatism discovered that there is a green oil in mustard seed, which cures it. When he made his discovery, he, as he was a benevolent man, left in his will directions that this oil should be extracted and extensively advertised, but never sold; it should be given away to all who applied for it. Numbers of poor people get it, and are cured of their rheumatism. The writer says: "How I know about it is because a lady told me that she applied for it whenever she felt a twinge, and it acted like a charm. It is a green-colored oil, and I daresay, if it were sold instead of being given away, everybody would use it. Some people are too proud to ask for it; others don't believe in anything that costs nothing, so they go on having rheumatism."

BRAIN WORK NOT FAVORABLE TO INSANITY.—The following is from the *British Medical Journal*: Does excessive brainwork tend to the induction of insanity? In general the answer to this query by professed alienists is that mental work pure and simple, does not tend to the induction of insanity. But the proposition is not so fully established but that additional proofs are very welcome. Dr. O. Ewart, in the *American Practitioner*, gives the result of his large experience. From 1870 to 1876, he admitted into the general Insane Asylum in Ohio, 1204 patients. Of these but seventeen had received an academic education. Only twenty-five professed to be professional men.

PRIZE FOR AN INSTRUMENT TO RELIEVE DEAFNESS.—From the *Boston Medical and Surgical Journal* we learn that Baron Leon de Lenval, of Nice, has offered a prize of 3,000 francs for the best readily portable instrument, constructed according to the principle of the microphone, for improvement of hearing in case of partial deafness. The committee consists of five eminent physicians residing in Germany, Austria and France, of whom Prof. Hagenbach-Bischof of Basle is chairman. The prize will be awarded at the Fourth International Congress for Otolaryngology to be held at Brussels in September, 1888.

DROWNING AT SEA.—A person who will throw himself on his back in the water, with his hands held clasped in each other at his back, and with his head thrown back so that the nose and mouth may protrude from the water, may float for hours and cannot sink in that position. A common feather pillow tied around under the arms is said to be worth half a dozen India rubber life preservers, while a common mattress placed on a blanket, a trunk on the mattress, then both trunk and mattress tied up in the blanket and all thrown into the water together will float with the tide for many hours.

HOW TO CURE STAMMERING.—A correspondent of the *Scientific American* says if a person in the habit of stammering will always fill his lungs with air by a strong inhalation before he begins to speak, he may very readily cure the most obstinate case of that trouble. At least that is the personal experience of the correspondent.

FOR CHILBLAINS the *Lyon Medical* advises that the parts affected be bathed twice a day, 10 minutes at a time, with a mixture of half an ounce of sulphuric acid and one quart of water.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MISCELLANEOUS.—The Bunker mill is now running only 20 out of the 40 stamps. The reason assigned for this reduction is that the ore is of a very low grade, and 20 stamps have been hung up temporarily to enable the mine to be opened up so as to get ore of a better quality. Twelve men have been laid off for a while in consequence of this change. In the North California the ore-body, reported to be 20 feet wide, has shown a decided improvement of late. All the sulphurets from the Amador Queen mine have been hauled to the reduction works at Sutter Creek. The pile consisted of 120 tons, of unusually low grade, on account of carrying so much sand. The 3-stamp mill of the St. Luis mine, near Pine Grove, is kept running steadily. The rock averages about \$75 per ton, and the mill gets away with a trifle over one ton per stamp every 24 hours. The ledge is small, and this is the most serious drawback to the success of the enterprise, as a great deal of other rock besides ledge matter has to be broken and removed in order to secure working room. The proceeds, however, are equal to the running expenses, and if the ore-body should expand it would at once become a good paying property. The Amador Queen mill is running to its full capacity. There is a large amount of rock broken, ready for crushing. We learn that the daily cleanup of the plates averages about 50 to 60 per ton, which with anything like a fair yield in the batteries, and the saving of concentrates, ought to pay very well. At Coal Mine No. 3 work is being vigorously prosecuted. From four to six carloads are gotten out daily. The mine shows flattening prospects, the coal deposit increasing in quantity and improving in quality the further it is explored. Negotiations are in progress for the sale of the Matson mine, at Buena Vista, owned by J. W. Brown and D. D. Matson. The intending purchasers are parties in San Francisco. Two tons of ore were forwarded to the city on Wednesday for treatment, and if the result comes up to expectations, a sale will no doubt be effected. A small seam of quartz was cut in the big tunnel at Middle Bar a few days ago. The strike is not considered of much importance. The header is now within 50 feet of being underneath the Mammoth workings. If the rich ore of the Mammoth extends deep, the fact ought to be demonstrated within the next week or two.

SUTTER CREEK.—Amador Ledger, Feb. 27: Eight teams are now hauling wood to the Mahoney. They want at least 20 cords on hand before they feel safe in tackling the drainage of the shaft. At the Lincoln 30 stamps of the mill are kept going steadily, with enough ore in sight to keep the same number of stamps in motion for six or eight months. The Iowa mill started two weeks ago and is likely to run for three weeks longer. No new developments at the Eureka; drifting is still in order. The work of getting the compressor in position at the South Spring Hill is progressing rapidly. The foundation is about completed and they expect to have the machine running in a couple of weeks.

ZELIE.—Amador Ledger, Feb. 27: At this mine they are having considerable difficulty with water. The water rose in the shaft and damaged the timbering to such an extent that the lower portion has to be retimbered. In the lower level, the work of taking out ore had to be suspended for several days, laying off a number of men until the repairs were made. Some of the stamps had to be hung up in the meantime, from 15 to 20 stamps being kept running on rock from the upper levels. The Zelie mill was brought to a standstill entirely on Thursday. The cave in the shaft is a serious matter and there is no telling how long it will take to repair it. W. Borkall has resigned the night foremanship, and James Harvey has taken his place.

Calaveras.

MIKE BONDED.—Calaveras Union, Feb. 24: The Oneto and Baranini quartz mines in Middle Bar mining district, owned by Jos. Oneto and Baranini, were bonded on Monday last to Israel W. Knox, of San Francisco for six months. A sum of money was paid down, and eight thousand dollars more is to be paid if the mines are taken. A tunnel is to be put long has been commenced in the Oneto mine, to tap the vein at a low level.

GOOD PROSPECTS.—Mt. Echo, Feb. 26: The Etna mine, situated about five miles northeast of Copperopolis, was located in 1853 and is now owned by the "Pine Log Co." Mr. John F. Carter, the present superintendent, informs us that the mine looks well and the prospects for it becoming a permanent and paying property is very flattering.

COPPER, POLIS.—There is some hope of a revival of the mining interests of this place. Several mining prospectors who are experts at the business have been prospecting this vicinity with considerable success. There are good mines both of gold and copper to be found here. All that is needed to cause this place to become a busy mining center is capital and energy.

Fresno.

NEW MINES.—Republican, Feb. 24: On Monday we were favored with a call by Mr. Peter Gortley who is engaged in opening up a most promising vein of gold-bearing quartz on Willow creek, in the recently organized mining district of Fresno, in the northern portion of this county. The location of this claim was made by Mr. Gortley in December, and during last month he faced an open cut to a sufficient distance to expose the ledge for a distance of nearly 30 feet. The ledge at first only showed a thickness of two inches, but at the end of the cut a mass of eight inches in width. The lead is in talcose slate and porphyry, the vein matter being so much decomposed that it is almost impossible to find a piece of hard quartz larger than a man's hand. The vein is extremely rich, both in free gold and gold-bearing sulphurets. Many locations have been made recently in this portion of Fresno county, and San Francisco speculators have secured considerable promising leads.

Inyo.

LOOKOUT MINE.—Independent, Feb. 24: The lower and upper Lookout mines are looking up. At Darwin and Lookout mining matters have not been so promising

in several years. The Defiance mine is now being well opened up, and the ore body found before the close of the past year is seen to be one of great extent and value. Mr. Reddy is still detained in San Francisco, being engaged as counsel in several important lawsuits. As soon as he can get a chance to go to Darwin, lively times may be expected at the Defiance. The recent strike at Lookout promises to be of equal importance; indeed, present indications are that this is a still larger ore body than the Defiance. A little more work at Lookout will open new ventilation, and enable Mr. Fitzgerald to extend operations there. The report of Mr. Gash on the marble quarry at Swansea is most favorable; in fact, the architect is enthusiastic over the fine quality and great extent of the quarry. There is every reason to expect that a large number of men will be employed there soon. Mr. Tom Boland still has a large force of men employed at Cerro Gordo. At Beveridge preparations are being made for a busy season, and a good deal of mining will be done there this summer.

MINING AT SALINE.—In Saline valley, east of the Inyo mountains, there are a great many mining locations, many of which contain fine prospects, but the difficulty of reaching the mines hinders their development. Billy Grant crossed the mountains yesterday, to work on some claims he has there. He has already done about five thousand dollars worth of work at the place. He has seven mining locations, and has already opened five ledges that go from two to four feet in width. The ore carries no lead, it is all chloride, born or native silver. Much of the ore goes as high as \$1800 a ton. Mr. Grant says there is plenty of wood and water close to the mines. From Big Pine station on the C. & C. railroad, there is a passable wagon road to all the mines, a distance of 65 miles. The country is quite unknown, except to a few prospectors, but these have done enough to prove that there are big chances for opening up valuable mines. A run of 70 tons of ore from the Chubasco mine, Beveridge district, is about completed.

LOOKOUT MINE.—Inyo Independent, Feb. 24: Three or four weeks ago an important strike was made in the Lookout mine, near Darwin. Report of the strike was delayed until the ore body should be opened up to some extent; this has now been accomplished and it is discovered that the deposit is of greater extent than had been expected, or even hoped for. Some difficulty was at first experienced in opening up the ore body through want of sufficient ventilation; but a fan and air pipes put in last week has remedied that trouble. All of the ore hitherto taken from the mine has been smelted at Lookout, but the ore of this recent strike is so much richer than any found in the mine before that Mr. Fitzgerald proposes making a trial shipment direct from the mine to San Francisco.

CLEVELAND MINE.—A run of ore from the Cleveland mine, at Fish Springs, was finished up at the beginning of the week. The ore yielded within a fraction of \$67 a ton in gold. In addition to the gold cleaned up a lot of rich sulphurets were saved and will be sent to San Francisco. Ore is now being got out for another run.

Monterey.

THE NEW CAMP.—Cor. Index: Your correspondent has been out to the new mining camp. H. F. Melville was found digging away at the start of a proposed tunnel, on what he terms a spur of the main ledge, making a cut about four feet wide and straight in under the top of the hill. There had not been work enough done to give an idea of what could be expected underneath. A town site has been located about a quarter of a mile from where they are at work at the foot of the hill, and on the banks of a would-be stream. Water is scarce except from seepage. Several claims have been staked out. Several of the business men of this town were seen up in the mining locality, but they disclaim any interest in the excitement. Reports from those interested indicate rich developments in a few days.

Nevada.

THE COE MINE.—Grass Valley Union, March 3: The Coe mine, which is now leased by James Theteway is very likely to be a good property in the near future. The old eastern shaft has been freed of water, and the drift, at the depth of 50 feet, is nearly cleared of rubbish and dirt. The ledge, at this point, is quite large, and some rock taken from it yesterday showed well in free gold. The general character of the rock is good, and the lessee is sanguine of his success. The drift will be continued eastward to the Pomeroy ground, which will give that company a good idea of what they have beneath the surface, as the drift can be continued and an upraise made at a small expense. It will be but a short time before the Coe will be taking out and milling good paying ore.

Placer.

ROCKLIN.—A. D. Hathaway has obtained a contract to furnish the granite for J. C. Flood's new building in San Francisco. It will necessitate the employment of 30 or 40 men in the quarries for some months. The Lee mine two and a half miles southeast of Rocklin, on the old Bradley place, is now the center of attraction to many people. It has lately passed into the possession of gentlemen who have ample means to develop it, namely Messrs. Chabot, Wall and Burdison, of Oakland. They are now putting up a ten-stamp mill. The Laird mine, two and a half miles south of Loomis, is also doing well. It belongs to a company, Mr. Laird being the principal stockholder. There is said to be enough surface gravel there to keep the present force about 12 men at work for many years to come. Half a mile south of the Laird mine is the Roadley mine owned and operated by Geo. T. Roadley, the well-known veteran locomotive engineer on the Sacramento division of the U. P. R. R. It is reported to be doing very well.

IOWA HILL.—Placer Argus, Feb. 26: Rich gravel has been struck in the Morning star mine, and the general public, as well as the parties most directly concerned, are jubilant. The main tunnel is 100 feet. At the end of that tunnel an upraise of 10 feet was made, and another tunnel was run under 100 feet into the gravel. Jan. Pascoe is the superintendent. Hon. J. E. Nod's one of the principal owners of the mine. J. E. Pascoe's drift mine on Independence hill is panning out well. Last week 3000 worth of nuggets was picked up by say nothing about the much larger quantity of finer stuff. One of the lumps weighed six and a half ounces, another five and a half ounces. H. Root-

man & Co. are at work on Prospect hill, and have strong hopes of striking a rich channel, which all the signs indicate to be there. The mine was formerly worked by hydraulic methods, and it was always a good paying claim. About four men are employed there now.

Plumas.

BIG FLAT CLAIMS.—Greenville Bulletin, Feb. 20: In the vicinity of Dutch Hill in the North Fork country, there is a long strip of comparatively flat ground capped with lava of varying thickness. Under this is an ancient channel of gravel. The present river cuts across this channel in one place, exposing the gravel to view. The strip of land is known as Big Flat, and reaches down to the Sunny-side mine, a distance of three miles or more. Claims have been located the entire length almost, and the development of the channel is being prosecuted. The series of claims consists of the Glazier, Cameron, Horner, San Jose, Alum Cove, and the Golden Curry. The Pliocene consists of 100 acres, and is the upper end of Big Flat, being cut off from the main body by the North Fork of Feather river. The ancient channel runs through the central part of the claim. The owners have run a tunnel up the channel about 100 feet. They will soon crosscut for the pay lead. The bed of gravel is supposed to be 250 feet wide on top, and about 30 feet deep. A lava cap 500 feet thick lies on top. There is gold in the tunnel now. Below the Pliocene and on the opposite side of the present river and on the line of the ancient channel, is the Glazier claim, the upper end of which is now being worked, and report says that it is now paying fully an ounce daily to the hand. It is certain that large profits are being reaped by the owners. A new tunnel is being run lower down on the channel in order that the claim may be opened up at greater depth and more extensively. The Glazier consists of 120 acres, and is about three-fourths of a mile long. A tunnel is being cut through the rim of the Cameron claim to tap the gravel. It is thought that it will be necessary to run seven or eight hundred feet to reach it. The next in order are the Highland Chief and the Horner, embracing seventy and forty acres respectively. The owners are running tunnels to cut the channel, which is also the case with the next location, the San Jose. The Alum Cove and the Golden Curry are owned by one man. From a break in the latter a large amount of gold was extracted last year, the sum being estimated at \$15,000. The exact amount, the owner has not made known. The rich lead was lost, however, but a diligent search for it is now being made. Adjoining Big Flat, a claim is worked by Messrs. Bressler, Ellis and Firmstone. It is situated about one-half of a mile below the Dutch Hill mine, and it is supposed to be the outlet of that channel. One tunnel was driven in, but it caved. Now another is progressing with good prospects of reaching pay gravel at an early date.

NEW OPERATION.—The late developments in the Indian Valley mine are inspiring owners of other properties with increased vigor. Work has already been commenced on the old Crown Point, under the management of J. P. Hall who has become interested in the mine, he being the owner of one-fourth of the property. We learn that some very rich ore was taken out of the Crown Point years ago by Mr. John N. Elrod, but the lead was lost. Mr. Elrod spent several thousand dollars running tunnels, and so great was his confidence in the mine that he obtained a patent for it. The Ophir Consolidated, owned by Mr. Hall, and adjoining the Crown Point, was not discovered until after Mr. Elrod's time, and the course of that vein would cross the Crown Point about parallel with the tunnels formerly run. Consequently a tunnel has been started on the Crown Point, and it is to be run at nearly right angles to those formerly run on that property. The course of this tunnel bears to the north center of the Ophir Consolidated. The arrangement which permits this work is important, as by it both mines can be operated successfully together. If the developments in the Crown Point are what is expected, the two locations will be one of the best mines in the district.

RICH STRIKE.—Plumas Natural, Feb. 24: One of the richest veins of quartz ever discovered in northern California has been opened at Mohawk, this county. It equals in richness the famous Edman mine at Eagle gulch. The ledge is known as the Valentine, and is owned by Neseman & Sons, J. B. Senon, of Mohawk, and J. Stephens, of this place. The find has raised great excitement in that mining district, and there will likely be some more valuable discoveries made. The prospects for Plumas in quartz mining never were more flattering than at present. The owners of claims are developing them with their own labor and are not sitting around waiting for outside capital, as a great many of them have been doing in years past. Plumas is fast coming to be the great quartz mining county and more prosperous times are coming.

ROUND VALLEY CONSOLIDATED.—At the time this series of properties was incorporated, it was concluded to extend one of the tunnels with the expectation of reaching another ledge. Work was immediately begun. John Schinner secured the contract and prosecuted the work steadily until last week, when the ledge was reached after running the tunnel about 350 feet from the place of commencement, making the entire length about 500 feet. As the contract was to reach the vein merely the ledge has not yet been crossed. The ore prospects well, and it is claimed that it will pay a good milling profit.

PREMIER MINE.—Greenville Bulletin, Feb. 24: From E. W. Young, who is in company with Jas. Young owns the Premier, we learn that the 3-e-stamp mill is now in operation. Ore is being extracted from the mine, and crushing will be continued as long as there is a supply of water sufficient to enable them to do so. As there have been no changes yet, it is not known what the ore will pay, but the indications are that good results will be obtained.

Shasta.

BULLYHOOP.—Shasta Co. Echo, Feb. 25: Everything up here denotes lively times this coming spring and summer. Mr. A. C. Tins started up the Mammoth yesterday with a large force and is enlarging his force on the Central. Mr. J. E. Hearn, came up Sunday and intends to push the Pomeroy Case ahead. He is also opening up the Dollar Valley. The Cumberland Mining Co. has had from ten to twelve men here all winter working on the road, in the mine and on the mill. The millhouse is up and covered. The house is

2x34, with four floors. The lower or concentrating floor is 20x24; the battery floor rises eight feet and is 12x24; then the self-feeder and ore bin, eight feet rise, is 10x24; then a rise of twelve feet is the rock-breaker and ore house, that receives the rock as it comes from the mine. Mr. Finch tells me he expects the machinery up within ten days. The Cumberland, Mammoth, Central and Pound Cake mines are waiting for lumber.

FRENCH GULCH.—Cor. Free Press, Mar. 2: In the Deadwood district McDonald & Franck are running full steam on good ore. Watts & Martin are repairing their mill and will start up again in a few days with lots of ore on hand. John Gibson is hauling his ore down to his arastra and expects a big clean up. The Van Meter Bros. are taking out very rich rock, and have many thousands in sight. Westlake & Co. are taking out good rock. Ballou & Co. have a four foot vein of good ore. On the French Gulch side we have the Niagara mill running on full time with big returns. The Washington Co. are taking out very rich rock. The Scorpion Co. have a four or five foot vein of rich ore, as also the Empire mine close by. Jerry Madden and John Murry have struck a good pocket on Dutch gulch; quite a lot of locations made there.

Trinity.

NEW RIVER NOTES.—Humboldt Standard, Feb. 25: John W. Hitchens and his brother, A. Hitchens, left New River last Wednesday, and arrived here Monday, having sold out their interest in the Grover Cleveland mine. There are about seventy men, they say, about New River City and White Rock. They have this to say of times in that country: The Grover Cleveland mine is doing finely and the Hard Tack at a recent cleanup from nine tons of ore obtained \$1,500. The G. C. Armstrong mine, No. 2, is now grinding in the Hardtack arastra. The Hardtack talks of starting up at an early day. Chas. Huff is digging a tunnel in the Uncle Sam mine to a rich ledge. Major Thomas and James Sinclair are taking rock from the Hunter mine to Sarvis's arastra to grind—it is very rich too. Last Wednesday a week ago Mr. Sley struck a very rich ledge on Slide creek below the Toughnut mine. Board at New River City and White Rock is one dollar a day and single meals fifty cents. The winter has been quite mild. About three feet of snow fell in January at New River City, but the rain that succeeded it washed it away. There is no snow at New River City but probably eighteen inches at the Mary Elaine mine. It is understood that J. S. Thomson calculated to run from Scott's Valley this summer a pack train of forty mules. The weather has been bright and warm at New River lately, and the roads coming were very good, except for a space of two or three miles. Coming down Trinity river they saw the placer miners at work and had encouraging reports from them. They have been taking out several "five and ten dollar pieces." Frank Russell on Trinity river is running a giant at his claim and expects a good cleanup.

Tuloume.

ORE.—Tuloume Independent, Feb. 27: A new shoot of ore has been found in the Keltz mine, which promises to surpass anything known in that locality before. Mr. A. P. Johnson has struck it rich in the sell mine. Judging from the size of the vein, he is liable to have a bonanza.

NEVADA.

Washoe District.

CUMSTOCK.—Virginia Enterprise, Feb. 27: HALE AND NUR. The sinking of the deep water below the 3000 level has been discontinued for the present, and a spooling station is being opened at the 2500 level. The sinking was continued 20 feet below this level or station for a drainage sump. After the station is completed a drift shaft will be started to connect with the Combination shaft when it shall have been sunk to the 2500 level. A force of miners are kept steadily at work in the upraise to the 2500 level from the head of the water on the 3000, in the good body of ore demonstrated to exist at that point. This upraise has reached about half way up to the 2500, and the ore taken out in prospecting this work is carefully stored in the drift on the 3000 level such time as it can be advantageously hoisted to the surface for milling.

CHILLAR.Nothing doing this mine except as connected with the south lateral drift on the 3000 level into the Potosi ground. This work is being very actively promoted. No orders are yet received to resume sinking the Combination shaft but such orders are daily expected. The sooner the water for the benefit of all concerned, for that objective point, the 2500 level, on or to be attained at speed, as practicable in order to connect with the Hale and Nurona deep water and give opportunity for explorations downward in Savage and Gould and Curry.

COS. CALIFORNIA AND VIRGINIA.—The total daily yield of this mine is about 100 tons principally from the slopes and breasts of the 1700 level and between 1000 and 1500. Of this amount 140 tons are taken from the upper portion of the mine above the 1500 level. The general average of the ore at the mine is about \$15 per ton. The drift southwest on the 1500 level is making good, steady advancement at favorable working ground the same may be said of the drift being run to the southwest on the 1400 level.

OPHIR.On the 300 level, the main drift or crosscut west from the old Mammoth shaft is now in 100 feet. On the 200 level a west crosscut No. 4 from the main north lateral drift is now in 50 feet, the face showing favorable vein matter with streaks and branches of low grade ore. On the 700 level the joint Mexican and Union drift being run to the crosscut through Ophir ground is now at 365 feet 47 feet having been added during the work. No ore features of interest to report.

POTISI.—The south lateral drift from the Chollar on the 3000 level is now being actively advanced in this ground, following along the footwall or west side of the ore vein where the ground works most advantageously. This mine now has to some extent the other main mine north of it in the matter of joint crosscut. The drift is to be carried through the extent of the mine 750 feet to the bull north line unless something unforeseen should occur to prevent.

GOULD AND HART.—The reopening of the old ore levels of this mine, above the 1500 level, has been com-

menced under the management of James G. Rule who assures the company that he can find a body of paying ore. He is starting in on the 600 level, and has about 20 men employed repairing the timbering and preparing for ore extraction.

CROWN POINT AND BELCHER.—Daily yield about 350 tons, principally from the old upper workings, with a considerable contribution, however, from the 1700 and 1800 levels. The best ore extracted comes from between those levels, and exploration on the 1750 level show the ore to continue downward into the submerged depths below.

BENT AND BELCHER.—The water in the Osbiston shaft, which belongs jointly to this and the Gould and Curry company has been lowered to about the 2100 level, and a few feet further will allow connection with the third line of pumps, after which the water will be lowered with greater facility.

KENTUCK.—Superintendent Dovey is actively carrying on the work of extracting low grade ore, at the rate of 75 tons per day, all of which comes from above the 1300 level. Exploration work also goes ahead with a view to future developments.

YELLOW JACKET.—About 135 tons per day is the average yield, keeping the Brunswick mill steadily supplied. The old ore breasts from the 1300 level up hold out well, showing an affluence of low grade ore.

SIERRA NEVADA.—On the 500 level 65 feet was added to the main north lateral drift, making a total length of 1884 feet. Material continues to be hard, dry porphyry.

ALTA.—On the 700 foot level the main lateral drift north toward the Benton ground continues advancing at a good rate of progress in favorable ground.

UNION CONSOLIDATED.—On the 500 level north lateral drift, No. 2 from the east crosscut is in 180 feet. Material, principally vein porphyry.

OVERMAN.—About 50 tons per day of low-grade ore are being extracted from the old upper workings and shipped to the mill.

MEXICAN.—The explorations on the 500 level show no new features worthy of mention since last week's regular report.

Columbus District.

A PERFECT DAM.—Grass Valley Union, March 3: A visit to the Golden Gate gravel mine, at Sucker Flat was made by a representative of the Union some days ago, and it showed that that company was doing everything possible to restrain the tailing from the mine. The dam, a substantial structure, is built in the bed or worked out portion of the claim, and is so arranged that not a particle of water even can get through, and is not allowed to run over the dam. The material being worked is dumped into the upper portion of the dam, while the water is allowed to flow down to the lower portion, and there comes to a standstill, and has to raise three or four feet before it can flow into the tunnel. When the water has raised to that height it flows gently over the top of a water-tight box and falls into the tunnel below in a much clearer state than when it enters the claim. Even the finest particles of sand are restrained and no unjudicious man, who takes a look at the singular contrivance, can truthfully say that any of the debris can possibly escape into the river. Besides this, there are several small impounding dams constructed in the tunnel, which would serve to catch the tailings in case of any accident to the main dam. The company are now working on a small scale, but are complying with the law in every particular, and intend to do so for all time to come. Any suit against that company at present would be merely persecution—nothing else.

THE MILL.—Cor. Inyo Register, Feb. 25: The new mill built at this place for the Candelaria W. M. & Co., although completed and ready for service on the 15th instant, was not started until the 21st instant at 2:30 P. M., owing to the lack of water. The pipes, which have been frozen for the past six weeks, were finally thawed out, and the clear and sparkling waters of the White mountains run again freely. Everything about the mill is of modern and improved style, rotary dryer, two White & Howell rotary furnaces, etc. The stamps weigh 950 lbs. each, and the mammoth Harris-Corliss engine, of 500 horse-power, seemed to know the duty it had to perform, starting without a tremor and proving worthy of its name. The mill will have a crushing capacity of fully eighty tons a day, and at this writing everything is running smoothly. The mill was constructed by J. B. White & Co. in the remarkably short time of seventy-five days, and is a model in every respect, there being ample room and all labor-saving facilities.

HOLMES.—Candelaria True fissure, Feb. 27: We are working in the McCuen ledge near the old 7th level, where we have a streak of good ore. The stope 60 feet below the Morris drift looks just the same. It is larger and strong and produces well. In the 8th level we are stopping the Morris ledge. This stope is 170 feet long and will average fully 4½ feet wide. The ore is good milling and all goes to the mill as it comes down. There are places in this stope that are very large. We will commence drifting west in this stope during the coming week. It looks like it will continue west for a long distance. The Creer is looking exceedingly well. The ore in the stope is very high grade. Several samples taken from this stope during the last week have given us \$500 per ton. This very rich ore comes from a streak in the stope that is about two feet wide.

MOUNT DIABLO.—The raise from the west drift on the 4th level is up 60 feet, and it shows 5½ inches of \$60 ore. We are stopping some \$100 ore from the west drift on the 3d level. The bunch of ore above the east drift on the 2d level looks well and is turning out considerable \$200 ore. The raise from the intermediate between the 1st and 2d levels does not look quite so well. The face shows about a foot of \$70 ore.

Eureka District.

ORE SHIPPED.—Eureka Sentinel, Feb. 27: What might be termed the "small" mines of the district have produced well the past week, when we consider the fact that this is the season of the year generally devoted to "dead" work. Notwithstanding the Ruby and Dunderberg Company have a number of men opening out new drifts in the Lord Byron and Home Ticket mines, they shipped from the Dunderberg to the Eureka Con. works the past week 40 tons of ore. The Jackson mine on Ruby Hill continues to render a good account of itself. During

the week tributaries in the property shipped to the same reduction works a fraction over a hundred tons of good ore. From the King Lear mine on Adams Hill there were shipped to the Richmond furnaces 42 tons of ore. To the same works the Bowman shipped 14 tons, the May 7 and the Frazier and Molino 8. The Prospect Mountain properties fell behind a little during the week, but nevertheless three of them have been heard from—namely, the Eureka Star, from which 2 tons were shipped to the Richmond works; the Republic 4 tons, and the Senator Beck 4 tons. From the C. O. D. mine, near Hamilton, 3 tons of ore were sent to the same furnaces for reduction.

Globe District.

BONDED.—Belmont Courier, Feb. 24: James D. Sullivan has bonded to John H. Bolles, president of the Excelsior Water and Mining Company, of California, the mining claim situated in Globe mining district, Nye county, Nevada, known as the Bullion lode or claim; consideration \$50,000. Mr. Bolles agrees to cause a shaft 100 feet in depth to be sunk on the footwall, and to cross therefrom to the hanging wall of said ledge immediately.

Jackson District.

FLOURISHING.—Silver State, Feb. 29: Late reports from Jackson district are to the effect that the camp is flourishing. The new mill is expected to start up in a week or ten days, on ore from the Pennsylvania mine, of which there is an unlimited quantity in sight in the stopes and piled on the dump. William Woolcock has resigned the position of foreman of the Pennsylvania mine and gone north with John Catlow, and Philip Skewes, an old Unionville miner, has been appointed in his place.

Jefferson District.

ORE.—Belmont Courier, Feb. 24: E. Frank Corlillo, of Jefferson, informs us that some very nice looking ore is being taken out by the chlorides. The Harrison Bros. are taking out good ore, which they will run through their little mill as soon as the weather gets warmer.

Ophir District.

IMPROVING.—Belmont Courier, Feb. 24: Postmaster Thomas Warburton, who returned from Ophir on Tuesday, is more than pleased with the outlook for that camp. The lower level of the Twin River Company's mine continues to improve as work progresses. Other mines will undoubtedly be opened there as soon as the weather permits.

Union District.

TO SINK.—Belmont Courier, Feb. 24: It is the intention of the purchasers of the Centras mines, Union district, to commence work on them by sinking the main inclines to water and crosscutting the ledges to determine in some degree their extent. The veins in these mines are all strong and spotted with mineral wherever cut into: should they continue to water permanent mines will be added to the bullion producers of the country.

ARIZONA.

CHERRY DISTRICT.—Prescott Courier, Feb. 24: Wm. M. Munds, J. H. Hardy and others are doing good work in Cherry district, which is about 30 miles east of Prescott and not far from Verde river and valley. The Etta mine is opened by an 80-foot shaft. It is a strong 4 feet vein. Rock from it has paid \$75 a ton in an assay. The Supply, Nazareth and Crosscut mines are pretty well prospected by shafts and tunnels. Messrs. Munds & Hardy have just purchased a steam engine from J. W. Dougherty, with which they propose running two 12-foot arastras, in which they expect to be able to crush from three to four tons of rock every 24 hours. Good roads connect this promising district with Verde and Prescott. The recent strike of very rich silver-bearing rock in the Yusembia mine was, we hear, rather unexpected. The mine, it was thought by some, was worked out, but the Italian lessees have proven the falsity of this belief. A week or more ago, they had 10 tons of \$1,000 ore and twice that many tons of less valuable ore. Gentlemen who have just returned from Hassayampa district are highly pleased with ledges belonging to Messrs. Bigelow & Smith, Dave Grubb and others. They are, they say, excellent properties, and should not be permitted to remain their wealth of gold and silver. They are not to exceed 12 miles from Prescott, in a country wherein timber and water are plentiful. We learn that Mr. Cartmell's lease of the Atzlun mill expires in June next when he proposes removing such of the machinery as belongs to him to a neighboring mill site, which he has secured, and there erect a mill of larger capacity. There yet remain about 100 tons of the old Peck tailings to be treated. Those already put through have paid well. The stamps are now running on Happy Jack ore.

COLORADO.

THE DENVER ORE MARKET.—Tribune-Republican, Feb. 25: The steady receipts of ore at this market from all parts of the State and surrounding mining regions demonstrate that Denver is growing more popular daily as the great ore market of this country. This winter has proved the most favorable ever known for the movement of ore by the numerous railway lines converging here. The various reduction works and the public samplers are receiving ore in quantities exceeding that of any previous period, and mine owners are well satisfied with prices and the courteous treatment accorded them. Pueblo receives a large amount of ore that is sampled and exposed for sale by the public sampling works of Denver. The Western States and Territories are rapidly becoming convinced that this is the best market for their ores because they receive prompt payment, and there is no glut in the demand for all kinds of ores that are valuable in either gold, silver, copper and lead, or combinations of these metals. No valuable ores are declined because associated with base metals and working charges for such are surprisingly low in contrast with outside and limited markets. Several large mines from the far West are delivering their entire product to one of Denver's reduction establishments, and yet the owners have never visited this city or are they personally acquainted with the proprietors of the works where the ore is treated. The business was begun by correspondence and is maintained through satisfactory returns. Such mine owners are well posted on the cost of reduction, know the inherent value of their ore and what net cash should be deposited to their account. Finding that this can

be obtained through correspondence they have felt no necessity for sending anything but their mineral to Denver and are perfectly satisfied. Other owners consign their product to the public samplers of this city with like satisfactory results. The old time squabbles over ore settlements are of the rarest occurrence now-a-days, but smelters and samplers are always glad to meet owners of ores and show them how they conduct their business.

IDAHO.

THE SILVER FORTUNE.—Ketchum Argonaut, Feb. 24: This mine, situated on the East Fork of Wood River, at the time work was suspended last fall gave the most positive assurance of a large and rich body of ore, so much so that work will be resumed as soon as spring opens, and prosecuted with increased energy. The mine is owned by Jack Reed of Bullion, Shainwald of San Francisco and Roberts of Utah, all men of means. The mine is situated in a good locality. A Chicago company and the Philadelphia company own adjoining properties. Its accessibility is much in its favor. Within the boundaries of the claim is an abundance of wood and mining timbers. The work thus far has been of the practical kind. At the bottom of a fifty-foot shaft the vein is sixteen feet between walls. A tunnel of 275 feet will by survey cut the vein in fifty feet more. The ore is of low grade, but the quantity makes up for the deficiency. Assays uniformly show sixty per cent lead, and upwards of forty ounces in silver. It is the largest body of ore on Wood River, and is easily worked. About fifty tons of ore is on the dump ready for shipment. On the whole, the Fortune bids fair to be a real fortune for its owners.

BANNER.—Idaho World, Feb. 23: The richest ore ever taken from any silver mine is now being taken from the 400 ft. level of the Banner mine east of the shaft. The Silver Chief shaft is down 175 feet, and the boys are driving a drift west on the vein, which is of fair size, but of low grade ore, similar to the Banner at the same depth. A new ledge has been located in Archie gulch, and bearing the good name of Senator Beck. The owners are James Irwin, of Payette notoriety, and James Monroe, of the Silver Chief mine. The ledge is the same one struck by James White in his tunnel to tap the Monarch. The Senator Beck is a well-defined fissure vein, and assays over \$100 per ton. The lucky owners are very much elated over their good find. James Irwin is going to open the best mining camp in America by the first of May, or as soon as his tunnel reaches the ore body in the Monarch lode. The Banner mine has out near four hundred tons of rich ore. Snow is but three feet deep in this section, but very solid, there having been so much rain.

LUCKY BAR.—Wood River Times, Feb. 24: Last Saturday afternoon, a meeting of the placer miners owning claims between Glenn's Ferry and Salmon Falls was held near the Ferry, for the purpose of organizing a new district. George W. Faylor was elected chairman, J. K. Lovelace secretary and F. K. Stamper recorder. The recorder of Cassia county was requested to appoint Mr. Stamper his district deputy. The new district is situated wholly in Owyhee county. It is bounded on the north by the Snake river and the Alturas county line; on the west by the Bruneau river, and on the east by the Cassia county line. "Lucky Bar" was adopted as the name of the new district.

MONTANA.

BUTTE.—Inter-Mountain, Feb. 24: The supply of silver ore at the mills is more plentiful at present than it has been for the last two months. At the Moalton mill they have been obliged to refuse ore, as they had more than they could run immediately. The Lexington mill is fully supplied, as is also the Silver Bow and the Dexter. The latter is running on ore from the Anaconda dumps, since the North Star has been shut down. At the smelters there are no changes to record, with the exception of the Montana Copper company they are all running. When this will resume work is not yet known, but they continue to run their pumps at the mine and are doing some prospecting work in the lower levels. At the Moulton the two, three, and four hundred foot levels are being worked. The best ore at present is found in the north vein at a depth of three hundred feet. The south vein is producing good ore but not as much as the north one. The pump at the 700-foot station will soon be ready for work. The main shaft at the Lexington is now 920 feet deep and will be sunk to the 1000-foot station in about two weeks. When that depth is reached cross-cuts will be run to the vein. In other parts of the mine there are no changes to record. At the Minnie Irvine we saw to-day as fine ore being hoisted as any we have seen in the camp. It came from the stopes over the 150-foot levels, and was spotted with chlorides and brittle-silver. An average sample from that part of the mine assayed 194 ounces in silver and \$38 in gold per ton. A winze is being sunk from the 150-foot level; it is now 40 feet deep, and the level is also being driven east. The mine is producing five tons of ore per day. The Amy and Silversmith have their new pump in place at a depth of 200 feet and are crosscutting. They are also putting up a new boiler which will be ready for use by the 1st of March. The lessees of the Golden Rule yesterday bonded the Lamonta lode adjoining, and have begun work upon it from the Golden Rule shaft at a depth of about 200 feet. At the Union Consolidated mines at shaft No. 1 (on the Goldsmith No. 2) at 200 feet deep they are drifting and stopping. At the Bachelor lode—shaft No. 2—they are sinking below the 200 foot level. At the Belcher lode—shaft No. 4—the shaft is 170 feet deep, and there they have just met water. The pump was started yesterday. At the Silversmith, Ellis & Co., lessees, have started a new shaft about seventy-five feet east of the main one. At present they are only twenty-five feet deep and are sinking an incline shaft on the vein. The new shaft on the Star of the West is 100 feet deep and is to be sunk to a depth of 400 feet. At the old shaft the pump is working, and some work will be done there in the old levels after the water is raised. Williams & Co. have recently leased the Del Monte lode owned by Mr. A. J. Davis. This is thought to be on the same vein as the famous Lexington. The shaft is seventy-five feet deep, from which they are at present drifting. The Pacific mine keeps the Old Lexington mill supplied with sixteen tons of ore daily from which they are turning out very good bullion. On the 23rd they shipped three bars weighing 297½ pounds. At the Lloyd and

Harris tunnel they are sinking on the Pennsylvania lode.

PHILLIPS RE.—Cor. New Northwest: The Granite will eventually demote the silver currency of the world—ships \$125,000 monthly product of a 20-stamp mill, and could ship a million without any trouble if the batteries worked on assorted ore. The ore chute in tunnel No. 5 is over one thousand feet in length, and placing a conservative estimate on the value of the mineral in sight, it will exceed fifteen millions of dollars. Everything about this great property shows system and order, and if any money is wasted on ornamentation or frivolity, "yours truly" has failed to perceive it.

THE HOPE.—Levels are now being driven from the shaft to intersect the vein on its dip. When these are completed stoping will commence, and the now idle mill will again drop its ponderous stamps. It is a commendable feature of the company's management of this property that they never give up when ore gives out. Byron Balard, who has had charge of the mine more years than I can remember, and who is undoubtedly better posted on its eccentricities than any other living man, and Supt. Geo. H. Babcock, deserve personal commendation for the valuable services they have rendered the company and district alike.

SAN FRANCISCO CONSOLIDATED.—Patten & Co. are driving the tunnel header steadily east. The vein is strong and carries a seam of gold ore on the hanging wall side. Indications are favorable for a body of high-grade pay rock within the next fifty feet.

OREGON.

GOLD HILL.—Grant's Pass Courier, Feb. 24: Among the discoveries on this hill is that of Morrison & Co., on the northeast. These gentlemen are starting a tunnel on their claim known as the "Buckeye." We like the prospect very well, and believe it is the intention of the company to do considerable work. It will probably develop into a good property. The Black Republican, of which one location has been made by Scranton & Ray, looks as though it might develop into something good. Marion Taylor owns the extension on this ledge and has done work sufficient to disclose a well defined vein—the only one we saw on the hill—which is from 12 to 15 inches thick, with well defined walls, which indeed gives it a look of a genuine mine. Mr. J. W. Scranton also has a cross-lead running northwest and southeast on the S. E. extension of this ledge. Douden & Co., a short distance to the southeast from Ray & O'Donnell, have made a rich discovery from which they have taken out some \$300.00. We examined the formation and find it very similar to that of the "Struck it at Last." Mr. Scranton's prospects—of which he has a number—are all in this immediate vicinity, and no doubt he will yet be one of the lucky ones. Fisher & Stewart have a rich discovery, about one mile from the old Gold Hill discovery, but as we did not see it or any of the rock from it, we are unable to say anything definite concerning its lustrous prospects. One mile from the "Struck it at Last," and to the northwest, is the famous Iron mine, the product of which yields 90 per cent magnetic iron. This iron is being used in Portland in the manufacture of Bessemer steel, and no doubt will be worked sometime very extensively. Magruder Bros. & Hayes are tearing the ground away at a lively rate with a giant in one of the gulches immediately below the discovery made by Ray & O'Donnell. As quartz is the mother of gold, and as it certainly exists above, these gentlemen will certainly catch their share this season. The Magruder & Hayes have a splendid digging; the water supply is abundant, coming out of Sam's creek, and they will probably run until June or July.

THE BLACKWELL DISTRICT.—About three miles southeast of Gold Hill—we mean the town—is what is known as the Blackwell district, which is now receiving attention both as to placer and quartz mining. It is in this vicinity that W. H. Swinden has recently made some startling developments. From Mr. John Swinden we learn that they were working their placer when they found the float which led to their rich quartz discovery. The rock shown us was fully as rich as that of the old Gold Hill "pocket." Mr. W. H. Swinden claims the discovery is no "pocket" but a genuine ledge. The Iowa, Illinois and Little Galena discoveries are also in the Blackwell district. Both gold and silver is found there and all the claims are showing up well for the amount of work done. D. B. Martin on Kane's creek, 2½ miles from Gold Hill is working a placer with the best of prospects. He is taking out a very fine character of gold, has plenty of water, and deserves prosperity. Oliver Boyd and other Woodville parties are also interested in the Blackwell district and are well pleased with their prospects. Mr. Boyd showed us a very nice specimen of galena from one of the claims they are working. There are many other claims over there worthy attention, but as our time was limited we did not get to see them. The one thing needful is a mill at some point near Gold Hill for the treatment of the ores now being discovered. The investment of capital in this direction would no doubt be a good thing for those investing in it, as there will undoubtedly be a great deal of paying quartz taken out this year. The advantages of a mill there are plainly visible, from the fact that there is a splendid water power, and lots of fuel, etc., which is largely in favor of such an institution.

UTAH.

PARK NOTES.—Park Record, Feb. 27: The Ontario will pay its usual monthly dividend of 50 cents per share to-day, aggregating \$75,000. Total of dividends this year \$150,000. An indirect report comes to us of a rich strike in the George Henry, a new property lately opened by Wm. Crockett, at the head of Dutch Canyon. Several miners have been laid off at the Daly mine for a couple of weeks on account of the teams not being able to haul ore, owing to the bad condition of the roads. Work on the Deer valley tunnel, owned by Messrs. Barry, Sharp, Gregg and others, is progressing rapidly. The tunnel is now in a distance of 150 feet. The Crescent concentrator has been undergoing a radical change lately. Its capacity has been doubled, the old machinery repaired or replaced by new, and everything possible done that will tend to demolish the monster ore dump at the mine with the first opening of spring.

1850. 1885.
RANKIN, BRAYTON & CO.,
...BUILDERS OF...
MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE TRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES THE BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be disconnected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1350 Patent, and will stand 300 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." BRETT'S
Oxidizing and Chloridizing
FURNACE.

A Continuous Furnace for Working the
Most Rebellious Ores.

For full description of this furnace see MINING AND SCIENTIFIC PRESS of Jan. 30, 1886, or address the inventor for circular.

The main features of the furnace are as follows: The self-discharging dust-chamber and automatic return to the cylinder when not sufficiently chloridized. A saving of a large percentage of salt. Saving in weight of cylinder, which is short, as the greater part of the sulphur is eliminated in the stack. There is less volatilization by desulphurizing without salt. A higher percentage of chlorination can be obtained by first desulphurizing, as shown in the report of the Navajo mine, at Tuscon, Nev. The separate fires give opportunity for perfect control of heat, making it easy to roast the most rebellious ores. By the constant motion of the pulp while being desulphurized, there is no danger of matting. The combination of flues and dust-chamber makes the construction comparatively cheap.

For further information, address

Alameda Co., Cal.

PROPOSALS

To furnish **SILK REELING MACHINES**
of the most modern and best patterns.

Proposals and correspondence to be accompanied with drawings or photographs of machines; also price. Address proposals to the **STATE BOARD OF SILK CULTURE**, 21 Montgomery avenue, San Francisco, Cal.

Pacific Machinery Depot.

H. P. GREGORY & CO.,

Nos. 2 and 4 California Street,

San Francisco, Cal.

IMPORTERS and DEALERS in ALL CLASSES OF

MACHINERY

SOLE AGENTS FOR

J. A. Fay & Co.'s Woodworking Machinery.
Frank & Co.'s Woodworking Machinery.
New Haven M'fg Co.'s Machinists' Tools.
Bement & Son's Machinists' Tools.
Bickford's Power Drills.
Blake's Improved Steam Pumps.
Perry's Centrifugal Pumps.
Perin Band Saw Blades.
Sturtevant Blowers and Exhausts.
Shimer Matcher Heads.
Brainard Milling Machines.
Turbine Water Wheels.
Bradley Cushioned Hammers.
Massey's Steam Hammers.
Schlenker's Bolt Cutters.
Holloway Fire Extinguishers.

Williamson Bros' Hoisting Engines.
Atlas Engine Works Engines and Boilers.
Payne's Vertical and Horizontal Engines.
Otto Silent Gas Engines.
Clapp & Jones' Steam Fire Engines.
Pickering Engine Governors.
Judson Engine Governors.
Tanite Co.'s Emery Wheels and Machinery.
Nathan and Dreyfus Oilers.
Korting Injectors and Ejectors.
Disston's Circular Saws.
New York Belting and Packing Company's Rubber Goods.
Lane and Bodley Saw mills.
H. W. Johns' Asbestos Packing, Paint, etc.

ENGINES and BOILERS

FROM 2 TO 100 H. P., ALWAYS IN STOCK.

A Full Line of **MILL SUPPLIES and LUBRICATING OILS.**

Chicago Prices Beaten!
ESTABLISHED 1860.
S. F. PIONEER SCREEN WORKS,
221 & 223 First St., cor. Tehama, S. F.
J. W. QUICK, Prop'r.

Sheet Metals of all kinds perforated for Flour and Rice Mills, Grain and Malt Driers, Furnaces, Chess, Cement and Smut Mills, Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Inventor and manufacturer of the celebrated Slot Cut and Slot Punched Screens. Mining Screens a Specialty, from 1 to 15 (fine).
Orders Promptly Executed

Mining Share Market.

Matters in the mining share market continue quiet. On the Comstock the main lateral drift south from the Chollar mine, on the 3100 level, is getting well advanced into the Potosi ground, and as it progresses southward toward the Bullion ground, it becomes more and more an objective point of interest in the development of the mines to the southward. In case this south lateral drift from the Chollar does succeed in running through to the Bullion, it is a plain proposition for the Bullion company to sink their Ward shaft down to that level, and connect with the drift in question.

This drift, through connection with the Ward shaft, giving good ventilation, etc., could be advantageously carried forward through the Eschequer and Alpha ground to the connection with the Yellow Jacket new shaft, which it would strike near the bottom, 3000 feet below the surface. The connection with the rest of the Gold Hill group is already made or easily can be; therefore, the importance of this drifting to the southward is not difficult to comprehend. Moreover, if the Yellow Jacket and other mines assist in the pumping, the lode can be easily drained, as the Combination pumps are doing that now. None but Cornish pumps, same as that in the Osiston shaft, could be used, as the present water motive supply is inadequate to run any more hydraulic pumps than the one in the Combination shaft.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department 10, San Francisco:

SAN JOSE AND ALMADEN R. R. Co. Feb. 27.—Object, constructing and operating a broad gauge railroad in the county of Santa Clara, commencing at a point on the line of the northern division of the Southern Pacific railroad, one-quarter of a mile south of Oak Hill station, and running thence to the junction of the Guadalupe and Los Alamitos creeks; thence up and along Los Alamitos creek to New Almaden, eight and a half miles in length. Capital stock, \$100,000, in 1000 shares. Directors, Charles F. Crocker, Ariel Lathrop, M. F. Smith, A. C. Bassett and J. L. Willcutt.

GUARDIAN PRINTING AND PUBLISHING Co. Mar. 2.—Object, to publish newspaper periodicals. Capital stock \$10,000. Directors, R. W. Pearson, S. A. Pearson, A. G. Pearson, J. McKee and J. Q. Adams.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Hanauer, Feb. 28, \$6680; Germania, 25, \$3964; Sprucemont, 24, \$2500; Germania, 24, \$11,800; Hanauer, 24, \$3430; Kent, 26, \$1280; Hanauer, 26, \$3440; Alice, 26, \$15,267; Germania, 26, \$2682; Kentuck, 27, \$11,350; Hanauer, 27, \$3450; Germania, 27, \$2604; 28, \$4754; Hanauer, 28, \$3500; Sprucemont, 28, \$3360.

PLATINUM.—Small quantities of platinum are found in most placer deposits, but miners have not taken much trouble to save it for want of a ready market. Those who have any on hand or save it in the future can, however, now readily dispose of the substance to H. M. Raynor, No. 25 Bond street, New York. Both native and scrap are purchased by him at his manufactory.

Testing and Working Silver Ores

The above is the title of an illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron, which has been issued by Dewey & Co. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working samples, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Fitchell's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles Smelting, Mexican process, Chilean process, Kroeckh's process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tallies, and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

Price, post free, \$2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 252 Market St.

Take a Receipt.

ALWAYS TAKE A RECEIPT from a newspaper agent. Not simply because a few out of many are tricky or careless, but because accidents will sometimes happen to the best of business men. It is a favor due to the publisher that every subscriber shall take a receipt from the agent, or clerk whom they pay. All our receipts have a corresponding stub which agents are accountable for and are required to return.

Inducements to Subscribers.

To favor subscribers to this paper, and to induce new patrons to try our publication, we offer the following advantages to all new subscribers who pay one year in advance, or present subscribers who will pay their subscriptions up to a date fully one year in advance of the present time. We will furnish the following articles (while this notice continues), at the reduced rates named, viz:

- REGULAR PRICE.
- 2.—World's Cyclopedia, 794 pages, with 1,200 illustrations, worth \$1.75. Postpaid for 50 cts.
 - 3.—Patent Binder (cloth cover) with name of this paper in gilt. Postpaid for 50 cts. \$1.00
 - 4.—To New Subscribers, 12 select back Nos. of the MINING AND SCIENTIFIC PRESS. Free .75
 - 7.—Any of Harper's first-class periodicals, 15 per cent less than regular rates.
 - 8.—Frank Leslie's and most other U. S. periodicals, 15 per cent discount from regular rates.
 - 9.—Pacific Coast and Eastern Daily, Books and Periodicals, except special publications, we can usually give 10 to 15 per cent less than advertised retail rates.
 - 10.—Picturesque Arizona, 380 pages, in cloth and gilt. Postpaid for 25 cts. 1.25
 - 11.—California, 100 pages, Magazine, 1880 to 1882 (3 Vols.), single Nos. Postpaid for 3 cts. .35
 - Per volume, unbound, 5 Vols., Postpaid for 20 cts. 2.00
 - Per volume, bound, cloth back and stiff paper sides. Postpaid for 40 cts. 2.50
 - 13.—Picturesque California Homes (40 building plans and estimates). Postpaid for \$1 3.50
 - 14.—Dewey's Patent Newspaper File Holder (18 to 36 inch). 25 cts. .50
 - 15.—Life among the Apaches, 322 pages, stiff cloth. Postpaid for 25 cts. 1.00

Note.—The cash must accompany all orders. If too much is sent for any article or publication, the balance will be returned immediately. Address this office, No. 252 Market St., S. F.

No. 252 Market St., S. F. is really a valuable premium to newcomers and others who appreciate the better class of stories and a good standard of California literature. Webster's Dictionary, 634 pages, with 1,500 illustrations. 50 cts. 1.50

Grant Lithograph, size 24x10. 50 cts. .50

Cleveland Fine Steel Plate, size 12x10. 10 cts. .50

Grant Steel Plate, cabinet size. 5 cts.

The Great History of Mining in California. 5 cts. .25

Beautiful Poetic Review of a handsome, entertaining and instructive souvenir of real merit. 25 cts. .50

Readers will please inform their new neighbors and others concerning our paper and these offerings. On application, sample copies of this paper will be mailed free to the address of any persons thought likely to subscribe.

List of U. S. Patents for Pacific Coast Inventors.

BOOKS ON WORKING ORES.

By GUIDO KUSTEL, M. E.

CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Are in Sheets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams.

This work is unequalled by any other published concerning the subjects treated. Its author is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in single order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Now out of print. Very rare. A few orders only can be filled at \$10 per copy. Sold by Dewey & Co., Publishers, 252 Market St., San Francisco, Cal.

ROASTING OF GOLD AND SILVER ORES (Second Edition) on the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver, is liberally illustrated and crammed with facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$5, gold, postage free. Sold by Dewey & Co., Publishers, 252 Market St., San Francisco, Cal.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL IN YOUR PAPER.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

THE ORIGINAL Roller Ore Feeder.

(PATENTED JUNE 24, 1873.)

This form of Ore Feeder is well adapted for its peculiar work. Manufacturers of the Celebrated "Challenges" Ore Feeders for any character of ores; also "Stanford Improved" Ore Feeders and Tullock's Ore Feeders for dry ores.

Prices furnished upon application to

JOSHUA HENDY MACHINE WORKS, 39 to 51 Fremont St., San Francisco.

CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street

THE ROLLER ORE FEEDER

(Patented May 28, 1882.)

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required. To the Banker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar or repairs.

Golden State and Miners' Iron Works.

Sole Manufacturers,

ANNOUNCEMENT.

The Clayton Air Compressor Works, of Brooklyn, have opened an office at No. 43 Dey Street, New York, for the sale of the Clayton Improved Air Compressors, Rock Drills, Mine Pumps, Hoisting Engines, Rock Crushers, Blasting Batteries, Wire, Fuse, and Mining Machinery in General. For Catalogue—August 1885—estimates and general information call upon or address, Clayton Air Compressor Works, Office, 43 Dey Street, New York.

[From the Engineering & Mining Journal, Aug. 8, 1885.]
The Clayton Air Compressor Works have issued a New Illustrated Catalogue and Price List. Every Mine Manager and Engineer should have a copy for reference, for none can afford to be without the information there given concerning the unsurpassed Clayton Air Compressors and other Machinery.

WANTED.

A Situation by a Competent Chemist.
Graduate of the Imperial Polytechnic Academy of Graz, Austria. He is thoroughly versed in both scientific and technological chemistry, analysis, assaying, metallurgy, mineralogy and geology. Would also go to Spanish America eventually. Address in care of
F. SUSTERBIC, Big Spring, Tex.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake. The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

IMPORTANT TO GOLD MINERS! SILVER-PLATED AMALGAMATING PLATES FOR SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.

Warranted the Best Made, Durable and Satisfactory. Full weight of silver and best quality of plating guaranteed.

BEST SOFT LAKE SUPERIOR COPPER USED.

3000 Orders filled. References first class. Prices the very lowest. Have received every Medal awarded on the Pacific Coast for Mining Plates. Old Mining Plates Bought, Replated, or Gold Separated.

SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS, 653 & 655 Mission St., San Francisco.

E. G. DENNISTON, Proprietor.

These Plates can also be procured of JOHN TAYLOR & CO., Dealers in Assayers' and Mining Material, 112 to 118 Pine St.

NOTICE.—Mining men are cautioned against purchasing inferior quality of Silver-Plated Mining Plates now being manufactured in this city. There has been a general complaint by purchasers that these plates proved defective in plating and short in weight of silver, assays showing great deficiency in silver guaranteed. This, light plating looks the same as heavy, but has no durability. Good plates can be furnished at same price these poor plates cost.

SOLE AGENTS FOR

GARDNER GOVERNOR COMPANY,

J. S. Mundy's Patent Friction Hoisting Engines.

The Mundy Patent has been sustained in the United States District Court of New York against the Ledgerwood Manufacturing Company, and also in the District Court in the State of New Jersey against Kendall & Roberts for infringement. Therefore all parties are cautioned against making, using, or selling Friction Drums that infringe this patent.

Gardner Governor.

GORDON & MAXWELL COMPY MINING PUMPS.

THE MOST EXTENSIVE PUMPING MACHINE WORKS IN THE UNITED STATES.

MORRIS COUNTY MACHINE and IRON CO. New High-Speed AIR COMPRESSOR.

We have recently furnished the contractors the machinery for La Trinidad (300 tons per day) and Silver Queen (100 tons per day). These mines are located in Mexico and belong to La Trinidad Company, of London. The Process is the Wet Concentration, and the Plants are, without doubt, the most substantial and complete of the kind ever built.

WE MANUFACTURE ENGINES, BOILERS, AND SAW-MILL MACHINERY, and Carry in Stock:

Wood and Iron Working Machinery, Best Belting, Lubricants for Cylinders and General Machinery, Including the Celebrated ALBANY LUBRICATING COMPOUND.

\$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR, OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS. (\$575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

New Gold Fields.

Attention is just now being turned to gold fields both in the Argentine Republic, South America, and Honduras, Central America. The Patagonian El Dorado is a new one in a region inhospitable in every way, but reports from there speak of the gold fields as very extensive. The facts are furnished by E. L. Baker, Consul-General to the Argentine Republic. The points in his report were obtained from an investigation made by a commission appointed by the Argentine Republic. Among other things that report says: According to the opinion of the mining engineer who has examined the case, the auriferous layer extends along the coast all the way from Cape Virgins to the north of the Barrancas del Condor, a distance of forty miles, and it is possible that it may extend to Rio Janeiro. The engineer thinks that these gold deposits are of a superior class, and that there is abundance of both gold and platinum.

There has never been any considerable gold mining in this part of South America, and the natives have but the crudest notions of how to proceed in the work of taking out the gold. Great excitement, however, prevails, and the Chileans are already hard at work. One hundred of them from Sandy Point have been at work in a body. Mr. Baker says it is impossible now to estimate the extent or wealth of the washings, but they are thought to be as rich or richer than those of California and Australia. While giving all these facts Mr. Baker advises that no rush be made to these new mines until something more definite is known about them. It is very probable that considerable of a struggle will be the result of this find in regard to who shall mine. The Chileans are particularly aggressive, and will probably claim pretty much of everything. Chile lies between Patagonia and the ocean and extends along its whole border. The Chileans are pretty good miners and will very soon prove the value of the deposits.

Reports have also been received of new placer fields in Honduras, Central America. Some California prospectors sent there by an Indiana company to examine the fields, on sending back their reports, caused considerable excitement in Chicago, and a number of persons have gone to the mines. James Rector writes back that the discovery is a very important one. The new field lies in the eastern portion of the republic of Honduras and about 150 miles from the Atlantic Coast. The placers are in and adjacent to the headwaters of the Guayape river, which is one of the tributary streams of the Rio Patuca, a region long known for its mineral resources. Mr. Rector and party have explored the stream and its gravelly bottom for nearly fifty miles, and have found scores of places where the gravel yields from 10 to 80 cents to the pan. They have begun regular mining, however, in a place where, after much toil, they succeeded in turning the river from its bed. They are sluicing out from \$7 to \$10 a cubic yard. The bed of the river they have reclaimed covers many acres in extent, and under the laws of the republic they can lay claim to it all. The facilities for placer mining are unsurpassed. The gold which has been sent up was exhibited to a select few in Chicago. The Government of Honduras, it is said, is very liberal to miners, let them come from where they may. It required no citizenship to work mineral land, and there is a very large margin allowed as to extent of holding. Gold and silver mining has

long been an established industry in the region of the Rio Patuca, but the inertness of the people, the apparent remoteness of the country and the lack of adequate capital has prevented anything like systematic work. Mining men from the West who are at present in Chicago are watching with keen interest the Honduras developments. The country is described as healthful, entirely free from malaria, and the temperature in the foothills of the mountain ranges where the placers are to be found at from 45 degrees to 75 degrees the year round.

Of course, in both these cases the mines are represented to be richer than the old California mines, just as when men find new quartz fields they always say the veins are richer than the Comstock; but so far, in neither case, have developments been carried on sufficiently to prove more than the existence of gold in certain localities. Whether the area is large remains to be seen. At all events, both places are so

A Steam Washing Machine.

Just at this time there is considerable interest on the subject of washing clothes by machinery. The steam washing machine shown in the engraving is one built by J. B. Jardine, of the Atlas Iron Works, 213 and 215 Mission street, in this city. It is one of the latest designs in the line of laundry machinery, and has given satisfaction where used. To a person who has never seen a steam washing machine in operation, a short description will be of interest. It consists mainly of two large drums or cylinders, one inner and one under. The inner one is corrugated on the inside like an ordinary wash-board, and the staves are set about three-eighths of an inch apart, so that the water and steam are free to go all through the interstices and thoroughly agitate the clothes with fingers of steam. The outside one rests on the floor of the laundry room and the inner

enterprise of Mr. Jardine. His list includes all that is necessary for the equipment of a first-class steam laundry, and persons desiring to start in business will do well to call on him before sending East for such machinery. Those who are afflicted with a mania for sending East for such machinery will find just as good here, and at the same time help our home mechanics and industries. Many steam laundries are now being started so as to displace the Chinese on this coast, and the manufacture of steam washing machinery will, no doubt, be a more important industry in the future.

Preparing Rocks for Examination.

A short time since we made an extract from Hussack's "Determination of Rock-Forming Minerals," describing briefly the two methods of examining rocks—the macroscopical and microscopical. In the former method of examination, those parts of the mineral mixture discernible to the naked eye can be studied with reference to crystalline form, cleavage, color, luster, streak, hardness, etc.

This method is by far the easiest for miners to follow, since by it they can easily understand and distinguish the enclosing and wall rocks of the different lodes they are working—those rocks having so much to do with the productiveness of the lodes they are working. The rocks have to be roughly prepared, so that the outer surface, viewed as an opaque object, with only the aid of a common hand-magnifier, will give all the information ordinarily required by the miner, and in most cases he will find he will be able to distinguish the structure and composition of the commoner rocks, so that with the help of a collection of types, prepared after the same fashion, he can compare and identify those under examination.

An excellent plan for preparing rocks for determination in this way was devised some time since by Melville Attwood, of this city. By his method the rock for examination may be prepared as follows: First, wash the specimen clean, using a brush to get rid of any clay or dirt, then select the side or part you wish to examine, and grind it down on a piece of sandstone (a shoemaker's sharpening stone), until a perfectly flat surface is obtained. This will occupy but a very few minutes, unless the rock is very hard. The surface should be then worked down still finer with a square emery file, using water, and after you have obtained sufficient polish, wash the rock again, and then let it dry gradually, either on a stone, or what is better still, a little brass table, with a spirit lamp. When perfectly dry, heat it again to a point so that it can hardly be handled; then varnish the polished side, while hot, with a mixture of one part of Canada balsam to three parts of alcohol, which must be warmed before applying it, and laid on with a camel's-hair brush. It will soon dry, and if left for a day or two will harden, so that you can handle it without injury. The effect of this treatment is remarkable, as the parts of the rock can be easily studied. All that can be claimed for this method of examination of rocks is that it is a rude and simple way for determining some of the commoner kinds, but the application of the microscope is, of course, what must be trusted to for exact results.

A NEW town called Petroleum Center has been founded north of Albuquerque, N. M., at the recently discovered oil fields.

JARDINE'S STEAM WASHING MACHINE.

far off and so expensive to get to that there is not likely to be any very large exodus from this country.

FINED FOR HYDRAULIC MINING.—The cases of Yuba county vs. the Eureka Lake and Yuba Canal Companies Consolidated on one count, and of Yuba county vs. the Blue Tent Consolidated Hydraulic Gold Mine of California on three counts, and of Yuba county vs. W. H. Wiseman, all for contempt of court in violating the injunctions by prosecuting hydraulic mining, were heard in the Superior Court at Marysville, and in each case a conviction resulted. The Eureka Lake Company was fined \$500 and the Blue Tent Company \$500 on each count, or an aggregate of \$1500. Wiseman was fined \$50, but the execution in the latter case is withheld. The two corporations made no defence.

THE Sharon gateway, at Golden Gate Park, will be constructed of white marble from the quarry of Inyo county. One carload of 10 tons has already been received, and is on exhibition at Golden Gate Park. A contract has been entered into with the Inyo Marble Company for the delivery of 800 tons of marble, at a cost of \$12,000.

one is caused to revolve. It revolves about 20 turns in one direction and then stops and runs 20 turns in the opposite direction. The object of this is to prevent the clothes from forming in a ball as it winds and unwinds any hall that would form were it to run continuously. In the machine shown the automatic running gear is not the least valuable feature. In the first place, it is very simple and durable and not liable to get out of order. The pulleys, belts, etc., are all on top of the machine in plain view, and the gearing is also out of the way, so that clothes and other things cannot catch in the clutches. If these things are near the floor, as in ordinary machines, there is danger of accident.

The pipe shown on top of the machine is the hot or cold water pipe, and the steam enters through a pipe at the bottom and is carried clear across the bottom of the outside cylinder. This steam pipe is perforated with about 75 quarter-inch holes, and when the steam is turned on it not only quickly boils the water or soapsuds, but starts a rapid circulation. The rushing water and steam take the place of rubbing and "elbow grease," with which it is customary to accomplish the cleansing of clothes.

This is only one of the many laundry machines which are being introduced by the

Machine Shops Here and Elsewhere.

Views of a San Francisco Mechanic Abroad.

EDITORS PRESS:—A journey beginning in June and extending through many of the principal machine shops in the Eastern States, then continued hither and through most of the heavy works on the Tyne, in the Manchester and Sheffield districts, has, as you may suppose, called up much thought and confirmed some old conclusions of mine respecting American manufactures.

I am, as you know, a believer in free trade, and have been denounced as an emissary of the Cobden Club. This subject I will avoid as much as possible with deference to the opinions of others, but not without asserting that my faith is one that professes more interest in American manufactures and our national success than those who hold to the "protective idea."

Mention is here called up by a recent visit of the Hon. T. G. Shearman, of New York, who has been in the Manchester district gathering, in a careful and impartial manner, facts and statistics, which he will no doubt give to the country in due time, and which should be of value on the ground that Mr. Shearman has no axe to grind or other end to serve than the good and honor of his country.

To come to things practical, what do you think of a conclusion like this? The Pacific Coast is in America the most advanced place in general and constructive engineering. This is my conclusion, taking into account *faibles accompli*, common and specific knowledge among engineers, the methods followed, the boldness of schemes and general skill. This considerable claim I venture to make, and like truthful James "will maintain." I saw in the Eastern shops an apathy and drifting with events that astonished me; old methods, tools and processes were just as I had seen them 10 years before. Some changes, of course, but nearly all in "extension of facilities," and but little in methods.

The equipment of the larger works in tools, lifting and handling appliances and in general character was, with one or two exceptions, inferior to our San Francisco shops. In Pennsylvania they seemed to be "waiting on Congress," but I am getting on dangerous ground. They were "waiting," however—that much is sure.

The tremendous resources of the country is a fact that continually thrusts itself upon one's thoughts. The Delaware River district, from Newcastle, should be, and some day, no doubt, will be the center of the metal engineering trades, as our English friends would call it.

The facilities cannot be surpassed, and are, to a great extent, utilized in, so far as works go. It would consume too much space to name over 20 or more establishments in this 40 miles, averaging more than half a million dollars of investment each, and almost idle at the time of my visit in July.

I claim, and moreover believe, the whole of the product of these works could now be going out into the world in competition with England, Belgium, Germany or any other country if the connection and circumstances existed to permit it. These European countries, amid advancing skill, have also advancing wages, a higher cost of living and a disaffection, we will call it, of skilled labor, that are great facts in the commercial future.

We little know, indeed, the important part that labor is now and in the future must play in European manufactures. I believe, and all statistics go to prove, that dear labor is the cheapest so long as efficiency is in proportion to rate; also, that the amount of labor in any particular commodity is not much different in different countries; further, that the rate of wages per diem is not an important matter in an economic sense, and of no use whatever as an illustration, without efficiency is taken into account. Wages may be higher in Portugal at 40 cents a day than in England or America at \$2 a day. It is the product divided by the rate that shows wages. This doctrine, as a proposition in productive economies, I think I was the first to promulgate, and it seems to be fast gaining acceptance.

Applied here in Europe, there is an element wanting in the fact that wages are forced up above efficiency by causes to be presently noticed. The men do not seem to care whether the work brings a profit or not; they look on capital as a kind of extraneous thing to be got at by any means, and not as a joint arm in their efforts. They moreover seem to look on work as a misfortune, hailing holidays with delight, and always ready for an excuse to "stop out." The cause of this most important feature, especially here in England, is due to two things: what I will call feudal organization, and the greater part of the wealth of the country being inherited. The British workman of to-day is not the ignorant man some of our friends would have us think. On the contrary, he is a thinking, reading man, and a very obstinate one.

He is surrounded on all sides by great stores of wealth, not gathered by his methods. He finds himself an equal factor in the government of the country now, with a vote; but his chances and position are not the same as others.

His "master" may have acquired a competence and wealth, starting at the same place and in the same way, but then his master is also unfairly treated, and there still remains a grievance, to so call it, in the fact a large part of community have not passed through this same school of drudgery, to which both he and his master have been compelled to submit.

By feudal organization I mean this patronizing of workmen in various ways intended as kindness, but destructive to that spirit of independent manhood that alone will produce a good day's work, and a desire to see capital have its share, after he has received wages in proportion to the work done.

Guns are now a great matter. The great works of Sir William Armstrong at Newcastle and those of Fentham Son at Sheffield, are busy making immense steel guns costing millions of dollars. The principal steel works are busy on armor plates. I have just witnessed the rolling of one 24 inches thick at the celebrated works of Sir John Brown & Co. of Sheffield. Thousands of tons of these are being planed, drilled, shaped, bent and sent off to various countries, who find it to their interest or expediency to devote wealth rising from industry to this wasted purpose, and in devotion to the old idea that to despoil your neighbor is to enrich yourself.

This, if not protection, is not free trade, and my opinion is, that among those agencies to prevent war, there is none that gives hope or promise in the future, except uninterrupted commerce between nations. The merchant and manufacturer must destroy the guns if it is to be done at all.

In shop manipulation I find great change and improvement in England—much more than was expected. American methods when superior are adopted without hesitation, and there is a kindly feeling toward the great republic among engineers, manufacturers and others, that makes one ashamed of the warlike spirit among a corresponding class in America.

We have much to learn from this older country as well as they have much to learn from us, and between the two both are going to have enough to do in competition with the continent where wages are following upward much slower than here, and slower than new methods and processes.

The great power of technological training, to which gunnery has given so much attention, is beginning to appear in various ways, which are apparent without explanation here.

The snow here is four inches deep and the ground has not been seen for eight days—one sign for that "remarkable climate" of Frisco. *Altringham, Cheshire, Eng. J. RICHARDS.*

Auriferous Sulphurets.

EDITORS PRESS:—In your remarks on the oxygen process, in the issue of the PRESS last week, you speak of the process as new, and that the Brin Brothers have succeeded in some way in making the basic oxide from which the oxygen is obtained indestructible.

Five months ago the thought occurred to me of using baryta as a source of oxygen in desulphurizing auriferous sulphurets, and I arranged an apparatus to carry the idea into effect, and found the mode wonderfully effective and rapid.

The basic oxide was first brought to a low red heat, absorbing additional oxygen from the atmosphere, and then the heat was raised to a low redness, and parted with its additional oxygen, which was carried into an iron revolving barrel, lined inside with a composition consisting of one-third asbestos, one-third fine clay, and one-third talc, resisting the highest heat. The barrel was heated from the outside, and a heat of about 700° to 800° obtained.

The action on the sulphurets was instantaneous and the reduction to oxides perfect. The mode was simple and entirely practical, and though only tried on 150 pounds of sulphurets at a charge, no doubt exists of its application to any extent. The saving in expense of construction and operation over the reverberatory or any other form of furnace for roasting ores was very great and the time of reducing a charge only two hours—a vast saving of time—the old modes requiring from 10 to 16 hours, according to nature of ores. I used the same quality of basic oxide in several charges and found it indestructible, therefore I do not see the novelty of the Brin method.

Wilson, in his "Inorganic Chemistry," at page 386, alludes to its indestructibility and that the same basic oxide can be used repeatedly to obtain a supply of oxygen. It certainly showed no loss of absorbing power in my repeated use of the same quantity and retained its quality in every trial with equal energy to absorb oxygen when heated to low degrees. I propose trying this mode of oxidizing sulphurets on a large scale—one ton to the charge—and will send you results observed.

I notice that your correspondent from Virginia City, describing the Comstock lode, speaks of Mt. Davidson having been named after Prof. Davidson. This is an error. The name was given the mountain in honor of the late Donald Davidson, who in company with Gen. Robert Allen, of the U. S. army, now in London, visited the Comstock, then known as the Washoe district, in the fall of 1859, shortly after the richness of the lode was brought to the attention of the world. This is history.

Gen. Allen, on the ground, proposed this name, and it was adopted at that time.

Some weeks ago I inspected a mine in this county that deserves mention in your columns, from the nature and richness of the ore it carries.

The sulphurets are arsenical pyrites found massive, and they assay over \$5000 per ton in gold. The mine is splendidly located for inexpensive work—fine water power of high head and wood in abundance. I note the fact of this mine for your columns because interesting in itself, and also for the reason that I do not know any other county in the State that yields in quantity this form of ore, and also that of petzite or tellurides of gold, made known by myself. They are the two richest known forms of gold ore: some have one and some have the other, but no other county has both in massive form.

LOUIS BLANDING.

Sonora, Tuolumne Co.

The New Gold Camp.

Arrow Mining District.

EDITORS PRESS:—Here are a few notes of observations made on a recent trip to the Arrow district mines in San Bernardino county. The mining camp is about 27 miles northwest of Fenner Station, A. & T. R. R., 581 miles from San Francisco.

The main ledge, from 5 to 25 feet wide, crops out over three miles in a north and south direction; the country rock west is granitic and east is porphyry; the ledge is, so far as explored, nearly perpendicular.

On several locations of this ledge the quartz is copper-stained, showing some hematite and pyrites of copper. In this quartz the gold is partly free and partly encased in hematite; by estimation made in burning out several samples taken from different parts of the ledge, the rock ought to pay from one to five ounces gold per ton.

At a distance of several thousand feet east from the main ledge are about six smaller quartz ledges, running nearly parallel with the main ledge; one, the Golden Queen, is explored by a tunnel 60 feet long and shows a vein about a foot wide, from which ten tons of the best ore were shipped to the Kingman sampling works in Arizona, which made returns of \$91 gold per ton; the second grade rock which is estimated at \$50 per ton remains on the dump for future reduction in the vicinity of the mine.

Some Mexicans work another small ledge by a shaft now 40 feet deep and take out and ship some very rich quartz.

Water is scarce in the whole district, and has to be hauled to the camp from a small spring three miles distant. Six miles from the main ledge is located the Arrow Weed spring, so called from a reed growing there which the Indians use to make their arrow with. It is the strongest spring in this district which by developing would furnish sufficient water for a 20-stamp mill. This estimation is made by experienced miners. There are several other smaller springs besides, which will be made use of at no distant day.

The road from Fenner to the mine runs through a nearly level desert; no trees in sight; a dreary country, where the prospectors have to pack the water along for several days before striking springs. Rattlesnakes and the like vermin are plenty, but are less of an impediment to the prospectors than the heat in summer.

The prospectors in those regions are entitled to all encouragement and to every cent which can be made there; but what assistance do they find in this city whose existence is founded on the enterprise, hardship and work of such hardy men?

When a liberal share of such a property as above reported is offered for assistance to develop its wealth, the miners are either treated as humbugs or impostors, or coolly answered that no miners are desired. The poor have not, and the rich will not. "We have been swindled so often and have lost so much money in mining operations, that we will not hear of it any more." That is the usual refrain, but if looked closely into, their mining (?) operations were nearly all conducted on California or Pine street, and the swindles performed by speculators and not by miners.

This Arrow district is no poor man's camp, where a miner may hope to make his pile; all claims are taken up.

Lumber is \$60 per 1000 feet; hay \$50 per ton, other things in proportion. There are yet only six tents in the district, where an enterprising traveler finds a hospitable reception by the boys. At Fenner there is a boarding-house (Hotel Fenner, they call it); its accommodations are good when considered from a prospector's standpoint, and charges reasonable.

The twenty-seven miles from Fenner to the mines may be made on horseback or by team; the fare of going and returning, 54 miles, is about the same as that from this city to Fenner, 581 miles. As strange as it sounds, there the mules have to make hay while the sun shines.

Probably the whole district will pass into more enterprising hands than can be found in this city, and just as likely draw its supplies from other sources. What of it? What do we care?

ED. WOLLER.

THE Boston and Montana Company's statement for January shows bullion product \$81,553; total disbursements, including salt, quicksilver, sinking shaft and winze, \$31,999; net profit, \$49,554.

Burning Liquid Fuel.

Mr. J. D. Bodwell, of this city, has for some years made a study of the question of the combustion of liquid fuel in ranges or stoves for domestic use, and has obtained a number of patents in this and foreign countries for his various inventions. Having put his devices to severe practical tests, which proved satisfactory, a company called the Pacific Coast Manufacturing and Transportation Co. was organized and is now engaged in putting up a plant to manufacture the liquid fuel and the appliances for its utilization. The buildings of the new works are nearly all up, and within a couple of months will be ready, some machinery being yet necessary to complete the arrangements. They have 16 acres of land on the bay shore near Shell Mound park, Alameda county, with a water frontage of 1337 feet, and extending back 525 feet, the track of the Northern railroad passing close to the rear of the land. The foundry building, which is 60x70 is all up, with several smaller buildings. There is also a boarding house, engines and boilers, deep well pump, etc.

The fuel used is not a crude petroleum simply, but a compound of petroleum and water, 20 per cent being water. A gas is generated from this mixture by the apparatus in the range or stove, and the gas is burned—not the oil itself. The presence of the water "mellows" the heat, being intimately mixed with the oil, strange as it may appear. Petroleum itself burns with a very intense heat, so that it is not adapted for use in domestic ranges, soon burning them out. The presence of the water overcomes this difficulty, and a pure petroleum gas is generated which burns well and answers its purpose admirably.

The Bodwell system of burning petroleum is entirely different from any before used. It has been in use in several places in this city for a year or more with satisfactory results. At the new works the product will be prepared for the market, and the ranges, stoves and burning apparatus will be manufactured for sale. Mr. Bodwell states that he has some 4000 orders to fill. He has applied his system to the ordinary form of range or stove which is intended to burn coal, but the conditions under which the solid and liquid fuels are properly utilized are so different that he had to devise a special range or stove in which the apparatus could be applied.

The apparatus for burning consists of a chamber of suitable size, closed at the sides, top and bottom, and having an opening near the top of one side through which the products of combustion may escape, and suitable draft openings to supply air. Within the range or chamber is a series of inclined plates or shelves over which the liquid to be burned is allowed to flow, falling from one to the other until it reaches the bottom or is consumed. When it is desired to heat water, passages are provided through which the water is allowed to pass and be heated.

The apparatus is not costly and is simple in construction and operation. The cost of the fuel itself is much less than that of coal or wood. The first is, of course, readily managed and regulated. To build the fire it is only necessary to turn a faucet and thrust a match into the fireplace. To extinguish the fire, the faucet is turned off. The heat will be regular and may be increased or decreased at will. Of course, there is no ashes and no dirt. As the combustion is complete there is no odor, and but little smoke. The cleanliness and economy of such a system will be apparent to all housekeepers.

The new works that are being built are intended to manufacture ranges and apparatus which are adapted to the flame produced by the Bodwell system. A range operated by this plan attracted great attention at the Mechanics' Institute Fair, and several restaurants and hotels adopted the system of using the apparatus and fuel. As soon as the new factory is finished the ranges and the product will be placed upon the market.

THE water in the Osbiston shaft of the Gould and Curry and Best and Belcher mines has been reduced to the 2100 level, and in a few feet further the third line of pumps will be reached and connected with, giving considerably increased drainage facilities. There is about 400 feet more of water yet to pump out, which is merely a question of time, as the pumping facilities are perfect, but the drainage of a vast extent of ground, not only in that mine but all the adjoining ones, has to be taken connectively into consideration, therefore too rapid progress must not be expected.

JAMES G. RULE has actively commenced operations under his engagement as superintending foreman, to develop and bring out the ore resources of the Gould and Curry mines above the 1600 level. He has about twenty men at work already on the 600 level.

THE Machinists' Union has appointed a committee to wait on the president of the South Pacific Coast Railroad Co., to ascertain the reason for sending East for two engines to be used on a cable road in Oakland, when they could be built here at the same price.

SOME abalone shells weighing ten pounds apiece were found recently during a very low tide on the rocks at Santa Cruz.

MECHANICAL PROGRESS.

A New Electrical Locomotive.

A decided departure from the practice hitherto followed in the construction of electric engines for working tramways has recently been introduced in an electric locomotive on the London, England, North Metropolitan tramway, by a Mr. Eliason. The London Times refers to this new device as follows: Instead of the electric motor being a fixture and having motion transmitted from it through belt gearing to the wheels of the car, the motor itself revolves, the motion being transmitted through bevel gearing. The system is the invention of Mr. Eliason, and the locomotive has been built by the Electric Locomotive and Power Company of London. The locomotive is similar in appearance to a short tramcar, and carries a secondary battery consisting of 50 cells. This battery is connected up with the electric motor, the motion shaft of which projects horizontally about two feet, and carries at its end a spur wheel which gears into a fixed circular rack. Thus when the motor is started it is, by means of this gearing rotated. A vertical shaft is attached to the under side of the motor, carrying at its lower end a bevel wheel which gears into one or other of two similar wheels on the driving axle of the engine. This mitre gearing is fitted with a friction clutch, by means of which the locomotive can be run either backward or forward. The 50 cells are equal to 250 amperes, and as the average consumption is stated to be 45 amperes per hour, it follows that there is a good six hours' supply of power carried.

The machinery is so arranged that a speed of eight miles an hour cannot be exceeded. Both the locomotive and the tramcar can be electrically lighted at night from the battery by means of glow lamps. We recently inspected the working of this locomotive at the tramway company's depot at Stratford, which was satisfactory in the limited space at command. It was started, stopped, and reversed very readily.

This machinery is of a simple character, and can be adapted to the tramcar itself in new stock. The Electric Locomotive Company are building a more powerful engine in order to demonstrate the application of the system on railway lines.

A NEW TEST OF BOILER STEEL.—Mr. Henry Schlacks, superintendent of motive power of the Illinois Central Railroad, uses a valuable shop test by drifting. That is, a $\frac{3}{8}$ inch hole is drilled in one corner of a piece of $\frac{3}{8}$ inch from each side and then drifted out. If the hole can be enlarged to $1\frac{1}{4}$ inches when the crack has just opened from the side to the hole it is good material. A $\frac{3}{8}$ inch hole in the center of a piece $3\frac{1}{2}$ inches wide should drift out to $2\frac{1}{2}$ inches to $2\frac{3}{4}$ inches when the crack runs from the side to the hole. But in the drifting test everything depends on the drifts and weight of sledge. The smaller or first drift should not be less than 12 inches long, $\frac{3}{8}$ inch at small end and one inch at large end, and finished on a lathe. The second drift should be 16 inches long, $\frac{7}{8}$ inch at small end and $1\frac{1}{4}$ inches at large end, while the third drift may be 18 inches long, $1\frac{1}{8}$ inches at small end and $2\frac{1}{4}$ inches at large end. A hammer not heavier than four pounds should be used, and the drifts should be oiled and driven from both sides, with not over four or five blows on either side at a time. If the drifts be short and blunt and the hammer 16 or 18 pounds, the enlargement of the hole at each blow is so instantaneous that the strain exceeds the strength of the steel, and even copper, under these circumstances, may be broken before it has drifted 1-16 inch. With light hammer and drifts, as described, a very satisfactory understanding, in a rough way, may be had of the ductility of steel.

NEW METHOD OF MANUFACTURING SHAFTING.—P. M. Haas, of Youngstown Ohio is the inventor of a novel method of manufacturing rolled and polished shafting. The round bar of metal delivered from an ordinary rolling mill and while at a cherry heat, is subjected to the action of a group of tapering condensing rolls which act peripherally and progressively upon the bar while the latter is rotating. After the bar has left these rolls, and when it is substantially free from heat, it is introduced into a die drawing machine of suitable construction. By this double manipulation the surface of the metal is first worked in one direction for producing a condensed scaleless surface, and then in a direction substantially at right angles to the first for producing the finish. The shaft when completed is said to be of uniform diameter and to have its surface metal condensed and hardened and free from pits and checks.

The tin bath used in tin-plating becomes foul by absorption of iron or other metal being tinned. The fluid tin may be poured off just above the melting point of the tin by allowing the bath to cool down slowly until signs of setting are noticed, when the pure tin will run off. The refining of the spongy mass or thick tin is too difficult for ordinary practice, and this is generally sold to chemical manufacturers or to brass foundries for brass alloys. Banca tin is supposed to be the purest and best for tinning purposes.

AN EMERY FILE.—An ingenious device for stretching emery cloth for use in the workshop has been brought out by Messrs. Edwards &

Co., of Charles street, Curtain Road, London. It consists of a couple of strips of wood about 14 inches long, hinged longitudinally, and of round, half-round, triangular or any other shape in cross-section. On the inside faces of the wood strips are pointed studs, taking into holes on the opposite sides. The strip of emery cloth is laid on to one set of the studs and the file as it is called, closed, which fixes the strip on one side. It is then similarly fixed on the other side, and thus constitutes what is called an emery file, and which is a handy and convenient arrangement for workshop use.

USEFUL INSTRUMENTS.—An ingenious instrument for ascertaining the distances of accessible and inaccessible points from the observer and from each other has been invented by Dr. Luigi Cerebotani, a professor of the University of Verona. This apparatus consists mainly of a pair of telescopes mounted on a stand and fixed on a tripod for use. The telescopes are both brought to bear on the object, and a reading is then taken from a graduated scale on the instrument, which, compared with a set of printed tables, gives the distance. By this means the inventor obviates the necessity for the base line, which has hitherto had to be laid down in these operations, and he dispenses with all trigonometrical calculations. Distance can be measured between the far off objects, and by means of a sheet of paper fixed on a drawing board a rough plan of the country under measurement can be sketched. In the same way the distances at ships at sea or of moving objects on land can be determined. The apparatus appears to be well adapted for land surveying, and particularly for military purposes. A practical trial has been made with this instrument on the Thames embankment, when its varied usefulness was demonstrated.

UNMAGNETIZABLE STEEL.—Mr. J. T. Boot omley has made some experiments with a piece of steel which was almost unmagnetizable. The steel was made by Messrs. Moses Eadon & Sons, of Sheffield, under Hadfield's patent, and contains 15 per cent of manganese. One side of the specimen has been polished and shows that the steel is capable of taking a very high finish. The present specimen has a tensile strength of 45 tons to the square inch. To test it magnetically the bar was first "touched" with steel magnets, but these had evidently no effect upon it. It was then placed between the poles of a powerful Ruhmkorff electro-magnet excited by 40 large tray Daniell cells arranged in fours for quantity and 10 in series. The bar was, however, still unaffected by the magnetism, so far as could be perceived by the hand. On testing it by a delicate magnetometer, however, it was found to show only a slight trace of magnetism.

SLOW UP OR CUT OFF.—A correspondent of an exchange says: "We have a 13"x20" engine running 114 revolutions per minute, and about half loaded. Which would be the better: to reduce the speed to 80 revolutions per minute, or to put a cut off on the back of main valve?" He gets as answer: "The cut off will give the best economy in fuel." We think that circumstances alter cases so often and so materially in steam engine practice, that our neighbor should have asked for further details before giving the foregoing "snap judgment." There are such things as wire drawing, back pressure and engine friction, which sometimes makes slower speed inadvisable.

COMMERCIAL EFFICIENCY OF ENGINES.—Outside of the question of the most economical boiler pressure and point of cut-off, to produce a given mean effective pressure, comes in that of the engine friction, which may be so great in large engines as to neutralize the economy of early cut-off. We might be getting a large engine and cutting off at 1-10 and using higher pressures, yet a given mean effective proves cheaper than by a smaller engine cutting off at 1-5 and using lower pressure, but the extra engine friction might neutralize this saving.—*Mechanics.*

A SINGULAR RESULT.—A correspondent of *Mechanics* writes that journal as follows: "Upon boring a three-inch hole through the length of a four and one-half inch solid cylinder of forged steel one foot long, so as to make a sleeve one foot long and three-fourths inch thick, without having to pay an exorbitant price for welded tube, we find our hollow cylinder is over 1 32 of an inch longer than the solid one from which it was made. Will some of your correspondents tell us why this is thus?"

TO TREAT WOODEN TOOLS.—The wooden parts of tools, such as the stocks of planes and handles of chisels, are often made to have a nice appearance by French polishing, but this adds nothing to their durability. A much better plan is to let them soak in linseed oil for a week, and rub with a new cloth for a few minutes every day for a week or two. This produces a beautiful surface, and at the same time exerts a solidifying and preservative action on the wood.

CAST-IRON PULLEYS.—can be lagged or faced with leather, without the use of rivets, in the following manner: First, brush over the face of the pulley with acetic acid, which will in a short time rust it and give it a very rough surface; then attach the leather to the face of the pulley with a cement composed of one pound of fish glue and one-half pound of common glue,

SCIENTIFIC PROGRESS.

OLDEST HABITATIONS IN AMERICA.—Major Powell, Chief of the Geological Survey, has discovered in New Mexico, near California mountain, what he pronounces to be the oldest human habitation upon the American continent. The mountains in this vicinity are covered with huge beds of lava, in which the prehistoric man and his comrades excavated square rooms, which were lined with a species of plaster made from the lava, and in these rooms were found various evidences of quite an advanced civilization, among them a species of cloth made of woven hair, and a large number of pieces of pottery. In the sides of the rooms cupboards and shelves were excavated. In the room, sticking out of the base face of the wall, was a small branch of a tree. When this was pulled out it was found that there was a hollow space behind the wall. Colonel J. H. Stephenson, Major Powell's assistant, broke this with a pick and found a little concealed niche, in which was a small carved figure resembling a man done up in a closely woven fabric, which with the touch of the hand turned to dust. It was blackened and crisp, like the mummy cloths of Egypt. In all, some sixty groups of these lava villages were found, there being twenty houses in each group. The evidences of civilization were similar, but removed by their crudity and want of skill a good deal from the articles found in the cliff houses.—*Santa Fe News.*

A LONG FELT WANT.—An exchange suggests that our scientists and inventors should cease vexing their brains about the photophones, the flying machine, perpetual motion, the north pole and the automatic car coupler, and endeavor to supply a long felt want in another direction. Bring forth some contrivance that will show at a glance the state of the atmosphere in a room so far as its purity or fitness to breathe is concerned, just as the thermometer discloses its temperature and the barometer its pressure. Let us have just such a convenient little instrument and it will prove a blessing to mankind, besides bestowing immortal fame and untold wealth upon its inventor. With such an instrument we might hope to demonstrate to the cold air fiend that pure air is not necessarily cold air. We should live longer, work better, and we should gain an immense advantage in our pursuit of happiness. Give the new meter any prefix you will, only make it handy and cheap, so that it may bang beside every thermometer in the land—and make it right away.

MOVEMENTS OF COLD WAVES.—The following conclusions are reached regarding the "cold waves," in a recent study by Lieut. T. A. Woodruff, of the Signal Service: The cold waves are found to follow an area of low and precede an area of high pressure. Within our territory they nearly always appear first at Helena, Montana, one of the furthest to the north of all our stations. The cold waves are observed to move thence in different directions: First, eastward across the great lakes and New England, not being felt south of the Ohio valley; second, southeasterly over the entire country; third, southward from Montana and Dakota to Texas and the Gulf States; and fourth, northeasterly over the Atlantic States. The waves travel from 50 to 100 miles an hour. They reach Omaha 8 to 16 hours after their appearance at Helena, the distance being 850 miles; St. Louis in 24 to 32 hours; Galveston, in 24 to 40; Buffalo, in 24 to 48, and Washington, in 32 to 56 hours.

FROST VS. LIFE.—In some recent scientific experiments on the effects of cold, two frogs were frozen solid in a temperature of about 20° F., and kept in that condition for half an hour. On thawing slowly they recovered perfectly, but it was found that longer periods of exposure invariably killed the animals. The experiment was tried of freezing hermetically sealed meat, so as to kill its bacterial organisms, and thus render it capable of putrefying. It was found, however, that so low a temperature as 80° below zero would not destroy the vitality of micro-organisms. It was thus made clear that the attempts to preserve meat for a long time by a momentary freezing of it must be abandoned.

A PITIFUL PENSION.—Prof. Huxley has accepted the pension of \$1500 per year granted him "in recognition of his eminent scientific services." It is a pity that the "recognition" of the services of the greatest British scientist of the time should be no greater than that often bestowed upon horse jockeys who are compelled to retire through overgrowth. But then Great Britain is a great and peculiar country, and John Bull, taken collectively or individually, is a peculiar institution—so says an exchange—but we fear that our own country and Government is not much in advance of England in its appreciation and reward of scientific research.

EXTINCTION OF AMERICAN ANIMALS.—Mr. Ernest Ingersoll, in a paper recently published by the American Geographical Society makes a startling record of the extinction of wild animals from this continent by the settlement of the country. Much of this lamentable decrease of animal life was unavoidable, but Mr. Ingersoll does well to descend upon the ruthless waste of one of our most valuable resources.

Only twenty-five years ago the great plains were covered with buffaloes and Mr. Ingersoll says: "I myself have seen steamboats halted on the Upper Missouri by swimming bands of these finest of wild cattle." But the extension of the Pacific railways has been made the occasion of a needless extermination of them. The elk, moose and deer have suffered a similar fate, until now it is said that the elk, which eight years ago were seen in thousands on the plains of the Sweetwater and in the Wind river mountains, have practically been driven to their last refuge in the southern Rocky mountain plateau.

Mr. Ingersoll shows that this baleful disturbance in the natural order of animal life is not limited to the land alone. Seals which once sported in the Atlantic surf along this coast southward to Cape May, have retired to the Newfoundland or Labrador coast. The habitat of the oyster on our Atlantic coast has seriously decreased. The feathered tribes especially the prairie chicken, the wild turkey, ducks and all game birds have been sadly depleted, and still the slaughter goes on almost unchecked.

Mr. Ingersoll suggests that an arrest might be put upon this uncalculated destruction by making and enforcing "a law which should permit so-called sport to be indulged in only by a selected few who had proved their capacity for common sense and self-restraint."—*N. Y. Herald.*

ASTRONOMICAL.—Progress in astronomy can only be made by a division of labor and concentrating certain points upon some one particular object of research. Our principal observatories all work at specialties. At Harvard the relative magnitude of the stars is the chief object of study; at Princetown, spectroscopy; at Alleghany Observatory, the dark part of the solar spectrum, and the effect of the invisible heat rays on the earth; at the National Observatory, positions and orbits of satellites; at Cincinnati, double stars; at Chicago, Jupiter's surface, and at Albany and Yale, perfecting maps of the heavens.

A PREHISTORIC TOOL.—While digging a cistern near his residence, Dr. C. L. Metz, of Madisonville, Ohio, made a very valuable find, which will be of interest to scientists; it being a paleolithic implement, supposed by him to be a scraper. It is about two inches in length, blue flint, and very rudely chipped. Dr. Metz is Superintendent of the Ohio Explorations of the Peabody Museum of Archeology and Ethnology, Cambridge, Mass. He is very much elated over his find, and declares it to be the first tool used by the inhabitants of North America, before the glacial period, ever found anywhere in these regions.

INDIA INK AND INFUSORIA.—M. Leo Errera considers India ink, on account of its harmless and its intense coloration, a valuable aid in the study of certain microscopic organisms. He has kept infusoria, etc., alive for several days in a solution of that ink, the carbonic matter having little or no effect upon the life of such objects. For making durable preparations ink diluted with water is gradually replaced by ink diluted with glycerine. Many organisms which are distinguishable with difficulty in clear water are easily observed in water charged with India ink.

ENERGY OF THE ELECTRIC LAMP.—Penkert, a European chemist, has ascertained by experiment, the relative portions of energy transformed by the electric lamp into light and into heat. The result shows that in the Swan system the proportion of the energy transformed solely into light is 28.1 per cent. In the Siemens it is 27.9; in the Edison, 26.3, and in the arc light, 38.3.

ANOTHER NEW SOURCE OF TANNIN.—A New Zealand conifer resembling the yew tree has been discovered by an American to be remarkably rich in tannin, the percentage being 28.66, as compared with 24.18 for sumac and 8.85 for oak, and considerable quantities of the bark are being imported at \$40 per ton, exclusive of freight.

LONG DISTANCE TELEPHONING.—An extraordinary feat in telephoning was recently accomplished between St. Petersburg and Boulogne, a distance of 2465 miles. Conversation was kept up, notwithstanding a rather high induction. The Russian engineers hope to succeed in conversing by telephone over a distance of 4665 miles.

ACID FUMES AND VEGETATION.—Careful observations by Sebroder, in Germany, show that one part of sulphuric acid in 54,000 parts of air will cause a serious damage to plants in a very short time. Coniferous trees are more sensitive than deciduous. Fruit trees are very sensitive.

THE EARLY ASTRONOMERS.—The completeness of the work done by the earlier astronomers is shown by the fact, recently stated, that out of the 6000 or more nebulae now known the Herschels had discovered 5000.

COPPER AND COBALT.—The valuable alloys of copper and cobalt are obtained by melting in a crucible metallic copper and cobalt under a flux composed of boracic acid and wood charcoal. They have a red color and a fine silky fracture.

SAN FRANCISCO:

Saturday Morning, March 13, 1886.

TABLE OF CONTENTS.

EDITORIALS.—New Gold Fields: A Steam Washing Machine; Preparing Rocks for Examination, 175.
Wooden and Iron Ships; The Mechanics' Institute; New Pumping Machinery; Ore Grinding Pans, 176.
Silver and Gold from Black Copper; The Hard Times, 177.

ILLUSTRATIONS.—Jardin's Steam Washing Machine, 173. Apparatus for the Extraction of Silver from Black Copper, 177.

CORRESPONDENCE.—Machine Shops Here and Elsewhere; Auriferous Sulphurates; The New Gold Camp, 174.

MECHANICAL PROGRESS.—A New Electrical Locomotive; A New Test of Boiler Steel; New Method of Manufacturing Shafting; An Emery File; Useful Instruments; Unmagnetizable Steel; Slew up or Cut Off; Commercial Efficiency of Engines; A Singular Result; To Treat Wooden Tools, 175.

SCIENTIFIC PROGRESS.—Oldest Habitations in America; A Long-Felt Want; Movements of Cold Waves; Frost vs. Life; A Pitiful Pension; Extinction of American Animals; Astronomical; A Prehistoric Tool; India Ink and Infusoria; Energy of the Electric Lamp; Another New Source of Tannin; Long Distance Telephoning; Acid Fumes and Vegetation; The Early Astronomers; Copper and Cobalt, 175.

ENGINEERING NOTES.—Bridging the Mississippi; Civil vs. Government Engineers; European Railroads; New Compressed Air Motor; Ship Canal Projects, 179.

USEFUL INFORMATION.—An Improved Can for Preserving Food; Sweet Potato Flour; A New Way of Keeping Fruit; An Infant Locomotive; Russian Railways; Removing Silver Stains; Leather Belts for Driving Rolling Mill Trains; A Ready Filter, 179.

GOOD HEALTH.—The Right Position in Sleep; Happiness and Health; Honey and Health, 179.

MISCELLANEOUS.—Practical Hydraulics, 178.
MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Montana, New Mexico, Oregon, and Utah, 180-81.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 184.

Business Announcements.

California Artificial Stone Paving Company.
Rubber Hose—Goodyear Rubber Company.
Machine Tools for Sale—A. B. C.
Optical Goods—C. Muller.
Steam Pumps—C. H. Evans Machine Works.
Steam Pumps—Dow Steam Pump Works.
Machine Oils—Loftus Brothers & Rich.

Passing Events.

The discovery of gold fields in Central and South America noted in another column, is attracting some attention among miners, but so far very little is known concerning the extent of the finds. Gold discoveries are generally more or less exaggerated when first announced. It was not long since that Africa was to be the new El Dorado, but the excitement there has died out.

The discovery of new petroleum fields in New Mexico is creating quite an "oil fever" in that region, and a number of prospecting wells are being bored.

On another page of this week's PRESS will be found an interesting letter describing the new gold mines in San Bernardino county. The writer lately visited the Arrow mines, and writes understandingly concerning the new camp.

The supply of snow in the mountains insures a good water season for the miners this year, though a good deal of water will run to waste owing to the prevention of hydraulic mining.

FULLY 2000 men are at work on the California and Oregon Railroad above Delta.

Wooden and Iron Ships.

We have on this coast as good facilities as there are in the world for the construction of wooden vessels. The ship-timber is most excellent, and the spars of nearly all the sailing vessels of the world come from here. Our timber is so long that very large vessels can be built without "butts"—that is, without planking or single lengths. The climate admits of men working out-doors all the year round along the coast. The timber resources are most extensive. So far, our builders have confined themselves mainly to coasting vessels, schooners and ternes, though a few square-rigged craft have been constructed and have given good accounts of themselves both in speed and strength. While we are engaged in building up our home industries this is one which well deserves attention and aid. Our material is of the best, and the other facilities are not wanting. It would seem that this is an opportunity for capital that should no longer be overlooked. It is not the biggest yards, either, that make the largest profit. In fact the United States Commissioner who has looked up this subject gives it as his opinion that one of the great drawbacks is the conversion of small yards into large manufactories, with extensive plant and comparative high cost of labor.

Although iron and steel ship-building is on the increase in this country, some persons are beginning to doubt the prevailing opinion that iron vessels will last double the time of wooden ones. There are plenty of wooden ships of 30 or 40 years of age still doing good service.

It was thought not long since that underwriters were prejudiced against wooden ships, and to test the matter circulars were sent out by the State Department, to the Consuls at foreign ports. The report respecting grain cargoes arriving at Liverpool are of special interest to us on this coast. We will therefore take 100 grain-laden ships, leaving the Pacific Coast to discharge their cargoes at Liverpool.

The record of 46 wooden vessels with cargoes of 1500 to 3000 tons, was as follows:

Condition.	No. of vessels.	Per cent.
Landed in perfect order.....	21	52½
Slightly damaged.....	8	20
Damage to 100 to 500 bags.....	5	12½
" " 500 to 1000 bags.....	4	10
" " over 1000 bags.....	2	5
Damaged by heating.....	0	0
Totally lost.....	0	0
	40	100

The record of 60 iron vessels with cargoes of 1500 to 3000 tons, was as follows:

Condition.	No. of vessels.	Per cent.
Landed in perfect order.....	31	51.7
Slightly damaged.....	7	11.7
Damage to 100 to 500 bags.....	6	10
" " 500 to 1000 bags.....	5	8.4
" " over 1000 bags.....	8	13.2
Damaged by heating.....	2	3.3
Totally lost.....	1	1.7
	60	100

The performance of 59 vessels built gave an average passage of 127.41 days; and the 40 wooden ships an average of 122.94 days. Of the iron ships nearly all were British, and the entire 40 wooden ships were American.

These figures make a very good showing for American wooden vessels, both in speed and the way they turn out their cargoes. The condition of the cargo at the end of the voyage is a highly important item. Our percentage of "slightly damaged" was larger than the English ships, but the "damage to over 1000 bags" gave a high percentage against the iron ships.

If wooden ships can make such good records as these official figures show, especially in our own class of trade, it would seem that we ought to build wooden ships ourselves, instead of using only those built on the Atlantic coast. Certain it is that the ship building business on this coast is one to which capitalists should turn their attention with the view of making it one of the leading industries.

DURING the month of February the Secretary of the Treasury purchased 1,450,000 ounces of silver for coinage into standard dollars, being about \$500,000 less than the usual monthly purchases. It is explained at the Treasury Department that the amount of silver fell short because no more was offered at the market rates. The price was higher, owing to the increased expenses of transportation during bad weather, which prevailed during the month.

WORK has been suspended on the Howland antimony mine on account of low prices.

The Mechanics' Institute.

On Saturday last the annual meeting of the Mechanics' Institute was held at the library, and the yearly reports of the officers were presented. They show the total number of members of the Library Association in good standing to be 2535, of whom 172 are life members, 2355 are subscribing members and eight are honorary members.

The library now has 39,246 volumes, including 3302 bound volumes added this year. The outside circulation during the past 12 months has been 72,121 volumes, being an increase of a little over 42 per cent in one year.

There are 348 daily, weekly and monthly papers and periodicals on file in the reading-room, giving the latest information on all subjects from every part of the world.

Three classes have been established in mechanical, free hand and perspective drawing, geometry and trigonometry, and in the Spanish language.

The receipts of the library and rental from a part of the library building during the year amounted to \$22,199.10, and the expenditures to \$19,999.50, showing a net gain on the library alone of \$2199.60.

The net profit of the Twentieth Industrial Exhibition was \$21,706.95, and the rental of pavilion and other property \$14,245.75. The disbursements have been \$38,350.65, including a reduction of \$23,000 on the mortgage debt, leaving a balance on hand March 1, 1886, of \$1195.40.

The assets of the association are as follows:

Pavilion block.....	\$300,000.00
Pavilion and other improvements.....	94,664.44
Lot and library building on Post street.....	100,000.00
Library of 3924 volumes.....	87,915.72
Money in the treasury.....	5,916.78
Money with librarian.....	552.36
Total.....	\$648,149.30

The liabilities are a remaining mortgage debt of \$110,000, leaving a balance of \$538,149.30.

The librarian was directed to prepare and have published a catalogue. A large expenditure for books was authorized.

The officers of election reported the names of the following gentlemen for trustees, to serve the ensuing two years: P. B. Cornwall, J. A. Bauer, D. A. Macdonald, David Kerr, W. P. Stout, John Mahoney and George H. Hopps. The meeting then adjourned.

The board of directors then met in session, and the newly-elected officers were installed, with the exception of Mr. Kerr, who was absent. P. B. Cornwall was chosen president for the fifth time, and the other offices were filled as follows: David Kerr, vice president; J. A. Bauer, treasurer; James Spiers, corresponding secretary, and W. P. Stout, recording secretary.

New Pumping Machinery.

The San Francisco Tool Company are now engaged in building some very extensive plants of pumping machinery, mainly for irrigation purposes. One novel piece of machinery they are building for Kenyon Cox Esq., of Anaheim. It is a centrifugal pump, resting on the top of a circular receiver, which is connected with sixteen different driven wells, located in a double circle around the pump. All these wells are drawn from at once, the flow of water being 118,000 gallons per hour, or 2,832,000 per diem—a veritable river from one piece of machinery. The question of irrigation is easy of solution where such plants can be put in operation.

They also have in process of construction a 15 inch centrifugal pump, with a capacity of 14,400,000 gallons in 24 hours, to be used for reclaiming land near Lodi, San Joaquin county.

They are building a plant also for Francis Smith, iron-pipe manufacturer of this city. It is a double-runner patent pump, with single-acting engine. The capacity is 1,440,000 gallons, 50 feet high every 24 hours, and it is to be placed near the town of Santa Clara. The San Francisco Tool Company make a specialty of irrigating and reclamation machinery, and have been very successful with their plants.

PRACTICAL HYDRAULICS.—We are asked by a subscriber at Georgetown, Colorado, who does not give his name, what the price of "Randall's Practical Hydraulics" will be when issued, and also the date of publication. The price will be \$2, and it will be several weeks yet before the work is ready for delivery.

Ore-Grinding Pans.

In working gold and silver ores by the continuous process two or more pans are used for grinding the pulp before it passes into the other pans for amalgamation. The objection to this plan is that a large percentage of the ore is sufficiently fine when it leaves the battery and needs no further grinding, but this all goes into the pans together with the coarse ore and is passed beneath the grinders, thus using unnecessary time and power, and much pulp that needs no further grinding is ground, and some that needs it is not ground.

Mr. Julius A. Bidwell, of Ivanpah, San Bernardino county, has just patented through the MINING AND SCIENTIFIC PRESS Patent Agency a form of pan to overcome this objection. A central well is formed in the pan, which is securely fastened to the muller which carries the grinding shoes. Upon the top of this muller, which is slightly contracted at the upper end, is secured a funnel-shaped screen. The bottom of the well opens through to a point beneath the muller.

The pulp from the battery being fed into the funnel-shaped screen passes over it, and as the muller, well and screen revolve, the fine pulp passes through the screen and down into the outer circle of the pan, above the surface of the muller, so that it may be discharged through the regular discharge opening, without passing beneath the muller at all. The coarser particles pass down through the well, and are forced beneath the grinding shoes by gravitation and the weight of the superincumbent column working gradually outward into the outer circle of the pan, from which they pass with the other material through the discharge opening or passages and into the amalgamators. By this construction, only that portion of the ore which is so coarse that it needs to be ground, is passed beneath the muller, and much time and expense is saved, while the grinding is much more perfectly done.

Mr. Bidwell has also patented an attachment to an amalgamating pan, by which the temperature of the material within the pan may be accurately known at any time. Pulp is usually heated to a considerable temperature to effect a favorable action in amalgamation. It is well known, however, that different ores require a different heat to produce the best results, and to accurately regulate this temperature it is necessary to plunge a thermometer into the mass from time to time. This is an inconvenient operation, and is very apt to break the thermometer, besides which, it is frequently neglected by the operator.

Mr. Bidwell's improvement consists of a thermometer of that class in which the lengthening and shortening of a steel spiral operates the index hand in position, which moves over a dial, an extension within which the spiral is contained, and a chamber formed in the side of the pan, into which this portion of the thermometer projects, so that without being introduced into the pulp, it is surrounded by it, so that the temperature is accurately recorded at all times. The conductive power of the metal chamber and casing will be sufficient, so that the thermometer will be acted upon and will indicate at all times upon the dial the temperature of the contents of the pan.

THE dividend of the Bald Mountain extension (Sierra county) drift mine, paid on the 1st inst., returns to the investors over half the assessments paid in opening the claim. The lead is now widening and is being followed on another bend westward up the Pliocene ridge. It is now believed that at least 2000 feet of the Ruby channel is on the Bald Mountain extension claim. That makes three gold leads they have, so far as known. The late snow-storm insures a good water season for the miners of that region.

RECENTLY the Sutro Tunnel Company commenced suit in Virginia City, Nev., to recover \$8824.50 from the Overman Silver Mining company, alleged to be due on a contract for the construction of a tunnel running through the Overman mine and tapping the Sutro tunnel. Wednesday the Overman commenced suit in this city to declare void the contract by which the tunnel in question is alleged to have been completed, and to restrain the Sutro company from any further proceedings in the matter.

Silver and Gold from Black Copper.

No. 1.

The ores treated at Oker were from the Harz mountains. They are lead ores mixed with pyrites, blende, barytes, chalcopryite and from 25 to 40 per cent of sulphur. They also contain small amounts of manganese, cobalt, nickel, bromide, arsenic and antimony. They are divided into five classes, and the working of the ores comprises seven distinct processes. They are mainly interesting for the separation of the silver and gold, which is done in several ways, one of which, the separation from black copper, is described by T. Egleston, in the last report of the Director of the U. S. Mint.

The lead ores are first washed and then leached with water to extract the zinc sulphate. This purifies the lead ore and gives a blue sulphate containing three per cent of impurities, the greater part of which is manganese. It is melted in its own water in a copper vessel, sifted to separate the large pieces and sold. The leached ores contain lead, copper and silver. They are treated in Piltz furnaces, which give lead and a lead and copper matte. The copper matte produced is roasted and charged in the furnace.

The mixed ores containing lead and copper are roasted and melted producing a lead which contains silver and a copper matte which is treated with the other copper mattes. The lead is cast in little round cakes, .20 meter in diameter and about .16 meter thick. They contain a great deal of copper. To purify the metal it is melted in large iron kettles holding about 10 tons. The scums taken off are liquated in the next kettle and are treated for copper.

The silver lead is cupelled in cupel furnaces, of which there are three, two with movable hearths, and one with a fixed one. They all work with coal. As there is an easy sale for the litharge, the lead is purified in the kettles, and all the pure litharge saved and sold. The screening is done in an ordinary trommel. The litharge is packed in barrels. There is no special arrangement for taking off the lead vapors, and cases of lead-sickness are quite common. It would be very easy to protect the men if the old ways of doing things were not kept up. Nothing is more remarkable about these works than the way old processes have been preserved.

The rich copper ores are smelted for a matte of 35 to 40 per cent copper, concentrated to 65 to 70 per cent smelted in black copper and treated for silver.

The ordinary copper ores are roasted with salt, leached with weak acid, and precipitated with iron or iodide.

5. The concentrated mattes and the cement copper are treated in a reverberatory furnace. The silver is concentrated in bottoms, part of which is cast into plates for the electrolytic process, and part is granulated for the extraction of silver. The rest is copper poor in silver, which is sold.

The granulated copper is treated with weak acid for copper sulphate, and the gold and silver residues smelted.

The silver is parted by solution in sulphuric acid and precipitated with copper.

The process of the separation of the silver from the black copper consists of several operations:

The silver is concentrated in bottoms in each a way as to make them almost entirely free from iron, cobalt and nickel, whose presence is objectionable because these metals gradually increase in the mother liquors and make the quality of the product impure, unless they are from time to time withdrawn from the circulation and treated for these metals. The iron sulphate cannot be separated from the copper sulphate without a special oxidation to make insoluble sesquioxides. The nickel and cobalt could be crystallized out, but this complicates the process unnecessarily, so that they are separated as far as possible in the dry way. The silver having been concentrated in the copper in a reverberatory furnace, is ready for treatment and is granulated as it is cast from the furnace. This concentration makes it possible to produce about half the copper made at these works to contain only .07 per cent of silver, which is so poor that it is sold. The other half contains .16 per cent, and this is granulated. The object of the granulation is so to multiply the surfaces of contact that the

solution may be made in the shortest possible time. It is done by causing the copper to run in a thin stream from the furnace into a water tank into which a stream of water runs continuously to keep down its temperature. The copper is made to run across this stream of water. If it is at the proper pitch and temperature the granules are formed perfectly, but there are many precautions to be observed. The copper must be sufficiently refined, and at as low a temperature as it will run, to avoid the danger of not cooling the copper sufficiently. The depth of the water and the supply must be sufficient to have the water cool enough at the bottom to insure that the copper will remain solid. To make this certain, the cold-water supply in some works is divided; one runs in at the top, crossing the copper stream to scatter the copper; the other is carried down by a pipe to the bottom of the tank, to insure the cooling of the mass there. If the copper is very hot, or the stream of metal too rapid, or the supply of water not sufficient, there might be danger of the copper being at such a temperature as to undergo only such a superficial

it. They are supported from the roof. Each one of these siphons communicates with the copper solution vats below. (As shown in the cut.) The spent liquors from the crystallization-tanks are pumped up into the acid-tank with a Kortings injector made of lead, the points of which are made of very hard lead. The liquors are concentrated with fresh acid at 50° R. to 30° B, and the acid mother liquors made to flow over the granulated black copper contained in the leaching-vats below. These are conical, .88 meter in diameter above and .72 meter in diameter below and 1.62 meters high. On the bottom of the tank, on both sides of the bottom opening, pieces of wood about .15 meter high are placed. Over these a few large pieces of copper are laid on as to prevent the grains from passing through them, thus forming a false bottom. The tank is then filled with the granulated copper.

Between the real and the false bottom there is an opening .10 meter in diameter, with spout 0.38 meter long, which projects over a shallow launder 0.88 meter wide. These tanks are hooped on the outside and lined on the inside

APPARATUS FOR THE EXTRACTION OF SILVER FROM BLACK COPPER.

cooling that, when it is altogether in mass at the bottom of the tank, it will readily become liquid again. The grains are sometimes cast hollow, but this is done only when the copper is to be oxidized in a furnace, and not, as in this process, by means of air and sulphuric acid.

The solution of the black copper granules in the acid mother liquor is done in a large building with several stories. In the upper one there are four lead-lined vats, 3.60 meters long by 1.70 meters deep, by 2 meters wide, in the clear. (See engraving.) They are held together in frames which are 15 centimeters square. The whole vat before putting in the lead is painted inside and out with tar to prevent the absorption or loss of the liquors in case of a break in the lead lining. All the wood of the building is treated in the same way. These vats are heated by steam to 70° R. At the end of every row there is a tank one meter square in which the steam is condensed. The lead to line the vats weighs eight to twelve pounds to the square foot. The pipe for heating the liquors lies on the bottom of the tank and turns on itself seven times. It is of lead .05 meter in interior diameter and .005 meter thick; both ends of the pipe are turned up. In each one of these vats there are four lead siphons, each one of which has a stop-cock at the bottom to regulate the flow of the acid, and a funnel on the side with which to start

with lead, 16 to 18 pounds to the square inch. The acid mother liquor is turned on to the granulated copper by the siphon-cock until it is wet. The acid is then turned off and the air left to act on the grains of copper, which it does rapidly, as the surface of copper exposed to the action of the air which draws up through the mass is very large. The outside of each grain is thus transformed into a very thin, black film of oxide of copper. The acid is then turned on again and dissolves out the oxide thus formed. This is repeated every three-quarters of an hour. The clear color of the liquor running out shows when the oxide of copper has been dissolved, and the liquor is then turned off until the black film forms again. As the copper dissolves out the tank is filled up.

In the New York suit brought by James M. Selover against Ashbury Harpending, involving the purchase of 5000 shares of State Line Gold Mining Company, for which Harpending was to be responsible in case of loss, a verdict has been found for the plaintiff for \$18,000.

There is no mining news of late from San Gabriel canyon or Rivena. The dividing rod business did not work on the Chaffey silver mine in Kern county.

ANTI CHINESE leagues are becoming popular in the mining sections of the State.

The Hard Times.

Times are hard and reduction of expenses in many cases is a necessity. Much judgment should be exercised in cutting off that which can be spared with least injury to one's industry and comfort. Those who may think that economy requires the stopping of a subscription to a good newspaper are liable to make a serious mistake. It is just when times are hard and especial effort is needed to make both ends meet that there is most value to be found in a journal, which presents the newest thoughts and the freshest experience. Many times suggestions of new ways to turn productive effort to account or cheaper ways to do common work, or means of saving valuable property from loss can be learned and made use of just at the time when such hints are most valuable. The testimony of our readers is that such things have happened in their experience many times. A good paper devoted to a special class of industrial work is a valuable aid and adjunct. It is like a good tool or implement, and to attempt to economize by stopping it would be much like a mechanic attempting to cut down expenses by doing without his grindstone, or some other very essential and useful aid in his work.

Aside from the direct and practical assistance which a good journal gives, there is the cheer and encouragement to be derived from its familiar columns and which serve an excellent purpose in maintaining the spirit and zeal of the reader, even amid troubled times. Such a paper becomes a valued friend in the family, and its loss is seriously felt by all. It is also an agency for the development of the intellect and the moral sense—a most valuable educational agency secured at a minimum cost. And it should not be forgotten that if we do not embrace passing educational opportunities, we cannot go back for them as we might to take up less essential advantages. There are a host of ways in which a true, conscientious journal wins esteem and returns value to its patrons—and at no time is it more necessary or desirable than during what are called "hard times."

In the case of the MINING AND SCIENTIFIC PRESS this is particularly true. Miners must keep pace with all improvements in both mining and metallurgy if they are to obtain as good results as others. During the past few years we find it possible to work mines that were formerly unprofitable, owing to improvements in methods and systems. Men who are hard at work on their own properties have little time to hunt up such matters. They depend on the technical journal to tell them what others are doing in their special branch of business. This is one of the special aims of the PRESS: to collate from all available sources the experience of practical men and lay it before others in the same lines of work. Improvements in processes, changes in systems, details of work, results of novel operations are all of practical, every-day use to the miner, millman or smelter. Changes in the mining laws, decisions of the departments and the courts, and such legal matters, all have their influence on the mining industry, and these we carefully watch for the benefit of our readers.

Aside from this the reader of the PRESS is kept posted on mechanical and scientific progress, and the general events of the scientific, mechanical and mining world. The letters of our numerous correspondents, describing new regions, the condition of various camps, the improvements going on, with suggestions and experiences on all sorts of subjects, are of great value to the reader. The harder the times are the more need has a man to learn methods and facts which will economize his labor and cheapen his outlay. And, moreover, during these periods of depression, the greater trouble will the editors take to procure information of economic value to the readers. No reader of the MINING AND SCIENTIFIC PRESS can afford to cut it off if he is reducing his expenses, for he will find it a constant aid to him in his business affairs.

EX-SENATOR CHAFFEE, of Colorado, well known among mining men from his connection with Leadville mining interests, died on the 9th inst.

On Monday, three miles above Dexter, J. J. Noonan struck the richest quartz ledge yet found in Shaasta county. The vein is seven feet wide.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

ZEILE.—Amador *Ledger*, March 4: The Zeile shaft is being repaired as rapidly as possible although the extent of damage below the 700-foot level is not yet known. It is believed, however, that another week or so will see the shaft in working order again throughout its entire depth. The mill is running steadily, although not to its full capacity. At the San Joaquin mine at Pine Grove, the pumping machinery has been started, and is working nicely. A week more is expected to clear the shaft of water. Mr. Hoffman of Santa Cruz, President of the Volcano Gold Gravel Mining Company, is in Volcano looking after the interests of the company.

SUTTER CREEK.—Steam was started at the Mahoney mine on Monday afternoon, but in keeping with the luck which has attended the operations at this mine for years, a break occurred a few minutes after the machinery was put in motion. The main driving pulley flew to pieces, and everything was brought to a sudden halt. The mishap is attributed to the fact that the works have been idle so long that the machinery run hard. The broken wheel, which was of cast iron, is to be replaced by a wooden one, well braced with iron, which is considered safer and more durable than the old one. Walkmeister of the planing mill has the job of making it, but it will not be in place for a week at least. The eight teams which have been hauling wood are laid off temporarily on account of the rain.

Calaveras.

A \$5000 CLEANUP.—Calaveras *Chronicle*, March 4: Mr. R. M. Ward, who is working a gravel claim in the old Gwin Mine gulch, made a cleanup Tuesday last, after a four days' run, the yield being \$5000. The work was all done by two men.

PATENT ISSUED.—Last Saturday Representative Louttit received word from the Interior Department that a patent had been issued to James Watson for the Gem mine near Angels camp. This case has been pending in the Interior Department since 1878.

El Dorado.

GOPHER.—Georgetown *Gazette*, March 3: Work on the Gopher mine is reported to be carried on with flattering prospects, and the prevailing opinion appears to be that it only needs to be properly managed in order to prove successful. A large number of men are employed and the 20-stamp mill is kept constantly engaged in crushing ore. Under the excellent management of the present Supt. F. E. Morse, it bids fair to equal if not excel the best paying mine in the county. Dr. Spencer having milled 28 tons of the mixed ore and bed-rock from the dump on his claim east of town, in the Eureka mill, is so well pleased with the result, that he will immediately begin further development of the mine. The ledge is of good size, and will probably mill at least \$10 per ton. The result of this test has greatly strengthened the confidence of our mining men in what is known as the "Dana lode" lying to the east of town, and four new locations have been made. The doctor has arranged for the use of the mill, and will resume crushing in a few days.

Inyo.

THE MARBLE WORKS.—Inyo *Independent*, Mar. 6: At the Marble works Mr. Luce is pushing his preparations as rapidly as possible to open up the quarry extensively. A new boarding house is now well along toward completion; when this is finished twenty-five men will at once be put to work, and more force will be added as new ground is opened up. Already there is quite an air of activity at Swansea.

FROM THE LOWER COUNTRY.—Inyo *Register*, Mar. 6: Surveyor S. P. McKnight returns here now after a sojourn of several months down in the Darwin-Panamint region. Only four men are working on the Panamint mill, so it is not likely its whistle will be heard for some months yet. Work is going on quite generally throughout that country, but no strikes of importance are reported.

POLETA.—John Clarke's teams bave for some time past been employed in hauling ore from the Polata down to the railroad. We are informed that about ninety tons are now ready for shipment. The ore will be taken to the Maxim mill, of which Mr. Storey now has control.

Monterey.

SILVER.—Cor. Salinas *Index*, March 4: Arriving at Soledad, the sole topic of conversation was the discovery of gold and silver bearing rock in the mountains overlooking Poverty Flat, about eight miles south of town. There are various accounts of the quality of this rock, your correspondent being informed by one man that it had assayed in the city as high as \$300 per ton; others said it was nothing but chrome iron. At the base of the mountain I was informed that it assayed only \$7.40 per ton and was worthless; again I learned from reliable authority that it assayed \$10 per ton. Passing up the road several camps were visible on top of the mountain, where a number of claims have been already staked out.

Napa.

CINNABAR.—Calistogan *Index*, March 3: Another discovery of ore that promises to be of much value has lately been made in the well known Napa Consolidated Quicksilver mine. From present appearances it will keep the miners busy several months. M. T. Brown, the present superintendent, has been successful in his work at the mine, and the stockholders will very likely soon begin to receive dividends again. When he took the property in charge he immediately stopped the loss of money, made it pay expenses, and he now has cash in bank to the credit of the company.

Nevada.

A REVIEW.—Foothill *Times*, March 4: The Empire mine is looking well in its lower level, and has more quartz than the present mill can handle. The Empire is run by steam, but one month of good weather will see the water wheels turning the machinery at this famous mine. The New York Hill Company have found a good ledge in the 13 level, north. This is the lowest level in the mine, and the fact that the ledge found there is quite large and

shows well in gold, gives great encouragement to the owners. We saw some of the ore at Peter Johnston's store, and it is certainly fine rock. The lessees of the Coe mine have about cleaned out the drift in the east shaft. Saturday evening the miners took out quite a lot of specimens from this mine, and general character of the ore is considered good. The drift at the depth of 60 feet in the Coe mine will be run toward the Powning mine (east) where the company expect that a body of good milling ore will be found. Crown Point is still turning out good ore, and at short intervals yields up more gold than rock. This summer the mill and machinery at the Crown Point will be enlarged. Ore is now being hauled to the custom mills from the Alpha mine and a contract will be let for sinking the shaft 200 feet deeper. This mine is located on the hill opposite the Idaho, and is being operated by a party of San Francisco capitalists. Yesterday the Idaho Mining Company let a contract for running the tunnel and making the ditch which will carry the water to the Badger mine. John Bennett got the contract and commenced work this morning. The tunnel and ditch will be between 300 and 400 feet long. Work of putting up machinery will soon commence. The tunnel and ditch will take the water from a point near the Crown Point mine, which latter mine will also be furnished with water by the Idaho company. The Wide Awake mine, on Deadman's Flat is showing up good ore. This property is owned mainly by Messrs. Wiley & King, and although they have been working it but a short time, they have taken out several hundred dollars in specimen ore. The ledge is about 18 inches in thickness, and the Co. will soon have a crushing of rock. The Phoenix Co. is drifting and stopping in the 30 level north and south. The levels are in about 60 feet from the shaft. The ledge in these levels is from 8 inches to 2 feet in thickness and is considered to be better rock than that recently crushed. The company and also the tributaries are now taking out ore for the mill, and will soon have another crushing. The last rock crushed for the tributaries paid \$35 per load. The Idaho mine is looking well; the 15 and 16 levels containing rich pay ore. The Idaho declared the other day its 107th dividend. The Horse-shoe is idle at present, but will resume operations as soon as the winter is over. The machinery upon this mine was inadequate to handle the water in wet weather and that was the reason the mine closed down. The North Star is now pumping and sinking. The shaft is down 1400 feet, and has a good paying ledge in the bottom. The concrete foundation for the hoisting works is about completed, and in a very short time the crown wheel and the hoisting works in general at the North Star will rest upon as firm a foundation as there is in any mine in the country. Work is still going ahead in the Green Mountain mine, the last crushing of 22 loads of rock from this mine yielding \$50 per load. Next week will determine the fate of Allison Ranch mine as far as the French syndicate is concerned.

A GOOD LEDGE.—A very rich quartz ledge has been struck in the old Osceola ravine, one and a half miles from Rough and Ready, which pays not less than \$40 per ton. The ledge is about 18 inches in thickness. The quartz is very rich and easily mined. The owners of the ledge are Henry Schroeder, Wm. Rex and James Huett. The principal owner is Wm. Rex.

A RICH STRIKE.—Grass Valley *Union*, March 6: A rich strike has recently been made in the Morning Star gravel mine on Indian canyon, opposite Iowa hill. The tunnel is in a distance of 1900 feet, from which an upraise of 40 feet was made, and a drift run along the channel 400 feet. Winzes were put down at several points, the last one giving splendid prospects of \$8 per car-load of coarse gold, in shape like melon seeds. Where this find was made is about 18 feet above the level of the main tunnel, which is to be extended to that point, and will be low enough to bottom the channel, which is now ascertained to be rich. The company feared the tunnel would prove to be too high when the channel was reached, but the drift which has been run above the tunnel level has proven that this will not be the case, and that the ground can be worked to advantage and economically. The Morning Star is an old claim, having been worked more or less for the last twenty-five years, and at one time as a hydraulic claim on the front channel, but the work done of late years has been with a view to drifting the gravel, which is the only mode practicable to work the gravel in the future. Hon. J. H. Neff, who is one of the owners in the Morning Star, has shown a reporter of the *Union* a late prospect from the claim, which was a handsome one to look at.

BOSTON MINE.—Grass Valley *Union*, March 9: The Boston Mining Company, on Wolf creek, near Boston ravine, is now sinking a shaft for a third level. The ledge in the shaft is showing of good size, and free gold and an excellent quality of sulphurets are found in nearly all the rock taken out. Everything goes to show that this is going to make a fine property, and it has the advantage of being worked cheaply, as the company has permanent free water from Wolf creek, which furnishes all the water that is needed for whatever machinery that may be put upon the mine. To pay the expense of the present dead-work of sinking the shaft, a small assessment has been levied, which is probably the only one that will be required in making further developments on the mine.

COE MINE.—The work now being done in the Coe mine is making a good showing, as the rock taken out is of excellent milling quality. The prospects are encouraging for more extensive operations and from the talk going on among the owners, there is a probability that that mine will be worked on a more extensive scale in the course of a few months, than at present.

Placer.

RICH DIRT AGAIN.—Herald, Mar. 3: We received a pleasant call from Mr. A. Breece, of Bath while he was in town last Tuesday. He informs us that in their mine, the famous Breece & Wheeler claim, they have been running for something over a hundred feet through a body of low grade gravel, such as they have encountered at times before, and such as occurs in all drift diggings. Recently, however the character of the gravel has been improving again, and on Saturday last he prospected a few pans which went as high as five dollars to the pan. This mine has yielded a vast amount of money and is to-day one of the best drift mining properties in the State. The channel is something over 60 feet wide, and on an average has proven very rich.

Plumas.

CONTRACTS LET.—Greenville *Bulletin*, Mar. 3:

Messrs. John Skinner and John Taylor have secured a contract to sink the Indian Valley shaft 75 feet; also a contract to run the Union drift 280 feet. They have 12 men employed in the shaft—three eight hour shifts—and six at work in the drift. It is expected that about six weeks will be required to complete the work. As the cage must be used by the contractors the mill will not run during the sinking of the shaft. This work is of very great importance to the proper development of the mine. We are to-day reliably informed that the Buckeye mine in Sawpit, one of the John H. Thomas properties, is in gravel; that they reached the back channel and found dirt which pays \$25 to the car. It is to be hoped that it is true. Very flattering reports are afloat concerning the Neesman ledge in Mohawk Valley. Some very rich rock is shown, and the property is said to be immensely valuable. San Francisco parties have been negotiating with the owners but the result is not known.

San Bernardino.

PROVIDENCE MOUNTAIN.—Calico *Print*, Feb. 28: Since last writing there has been considerable prospecting done around Providence mountain. There is more prospecting going on here now than at any time since the Bonanza King was discovered. Lately some rich discoveries have been made on the west side of Providence. Arrow district still improves with work. The shaft on the Mountain Pass claim on the main ledge is down 25 feet showing rich gold ores. Sam King has gone to work on the Relief claim on the same ledge. The Mexicans are working their La Prati claim and are down over 40 feet, showing rich ore in the bottom. The Golden Queen has a tunnel of about 70 feet, showing rich gold rock nearly all the way, and the owners are also sinking a shaft which is down about 20 feet, showing good mineral. R. Gorman is working the Lookout claim, getting good shipping ore. Small openings have been made on several other claims, which indicate good ledges. There is no work for miners as yet in this camp, as the owners of the various mines are all practical miners themselves and they are developing them.

MESCAL CAMP.—The parties who have bonded the Cambria mine have some ten men at work. The mine is improving with work; the winze from main tunnel is now down nearly 100 feet, with rich ore in it in the bottom.

San Diego.

THE JULIAN MINES.—Los Angeles *Herald*, March 4: Col. I. R. Dunkelberger reports the outlook very encouraging at Julian. He is driving a tunnel in the Eldorado mine, in the Banner district. The tunnel is now in 340 feet, in talc and slate. He expects to tap the vein in 34 feet more, and a contract for another 100 feet of the tunnel has just been let. The point of intersection is 239 feet below the croppings. An upraise of 90 feet will be made to connect with a 150-foot shaft down on the ledge. There is forty feet of water in the shaft. The croppings consist of rich ore chutes in granite. Two ledges are developed at a considerable depth. The ore in these chutes went \$300 per ton. The ledges have granite and slate walls. Four and a half feet per day is the rate of progress made in the tunnel. The Owens mine is being worked by James, Farrel & Co. They are down 200 feet in a shaft, and have a large body of fine ore. They expect to put up a twenty-stamp mill. John Farrel is the well-known mining capitalist from Tombstone. The old Shenandoah mine and mill is being run by Mr. Farley, of Banner. James & Fulton are running a ten-stamp mill day and night on Stonewall ore. The Bailey brothers are running a ten-stamp mill on Ready Relief ore. Cowles Brothers and Chalmers are running a five-stamp mill on Hubbard ore. Chlorides are taking out fine ore on the Hidden Treasure, Antelope and Blue.

Shasta.

WHISKEY CREEK.—Shasta *Courier*, Mar. 3: We had the pleasure not long since to visit the Gold Mountain mine, discovered by a Mr. Jackson Ferguson, of the State of Nevada, and surely it is well named, and the biggest mine I ever saw; the ledge is from 50 to 60 feet wide, and the cropping looms upon the mountain side for hundreds of feet, the ore being rich in sulphates, assaying over \$1000 in gold, and from \$4 to \$6 free gold. It seems strange that this mountain of gold-bearing rock should remain so long undiscovered. This mine is splendidly situated, being on the county road, with plenty of timber and water. The mine lies in the same range with Iron mountain and Deadwood mines. This is an old placer mining country, some of the creek being very rich. One mine called the Mad Ox quartz mine, has been worked for years and very rich, but is now abandoned, and we can only feel glad to think of this valuable discovery.

STRUCK IT.—Mr. West who was employed by James and William Campbell, some time ago has recently been prospecting in the mountains above Iron mountain, and has struck a very rich deposit of gold, and is on the eve of becoming a capitalist.

HUNTINGTON MILL.—Shasta *Co. Democrat*, March 3: Bell, Hopping & Co. are erecting their Huntington mill on the Central mine in Old Diggings. W. O. Smith, secretary of the Iron Mountain Mining Company, E. P. Figg and other stockholders of San Francisco, went up to the mine last Thursday to be present at the starting up of the ponderous machinery. B. F. Slater, who was over to Muletown Monday, informed us that a Frenchman, whose name he did not learn, struck a pocket on the mountain this side of Muletown, from which he took out \$4000 in a couple of days. Mr. Slater further says the vein is over four feet wide and shows gold all through the rock. That's the kind of a prospect to find.

THE LOCO FOCO.—We almost forgot to mention this location which we visited on our way up and where we met Fred Simonds Sr., the locator. It is situated near what is known as the Big and Little Limestone Springs on the east side of Shoemaker creek, the west end extending down to that stream. It is a big deposit of gossan ore from 50 to 200 feet in width which crops out on a very steep mountain spur. Fifteen assays have already been made from the croppings, the results ranging from \$5 up as high as \$185, the average being about \$75 to the ton. Mr. Simonds has made five locations here, which takes in several living springs and a fine body of timber.

THE SNYDER MINE.—Our reporter camped with that genial and big-hearted brace of miners, Carson and Snyder, owners of the Snyder mine situated

about 400 yards south of the Crossus. Here we found Fred Simonds Sr. and friend Rideout. J. N. Vannoy, who is doing assessment work on an adjoining claim, was there also. Carson & Snyder were hard at work running a tunnel on their vein and making from four to six feet a day easy. The tunnel, which is now in about 50 feet, is driven along the side of the vein, exposing a body of ore that averages five feet in width. When in about 40 feet further they will tap the rich pay chute a hundred feet or more beneath the upper tunnel. They have a prospect which certainly shows up handsomely, and will soon have it developed sufficiently to show its permanency and value.

THE CLIPPER CLAIM.—About a quarter of a mile farther north, and the last mine on the belt, is the Clipper, owned by Frank Davis & Co. Here we found Davis driving a tunnel on the Clipper with the assistance of two men. He is running the tunnel along the vein, leaving the ore in place, and everywhere we found rich rock showing free gold at a glance. Mr. Davis has exposed this vein in about a dozen different places and for 600 feet along the surface the rock shows free gold, which is strong evidence that the pay chute or chimney is fully that many feet in length. The mine is admirably situated and can be developed cheaply.

THE SILVER KING.—This is the name of a mine recently located by Mr. Burnett, in which the assayer, De Forest, and a Sacramento gentleman are interested. It is situated directly southwest of the Loco Foco on a stream known as Mary's Fork, and almost on an air line between the famous Blakall mine west of Squaw creek and the Loco Foco. The Silver King is a three-foot vein, and so far the ore assayed averages \$45 per ton in gold and as high as 1600 ounces in silver. As soon as Mr. De Forest gets his sampling mill running in Redding he intends to work the choicest of the ore.

SQUAW CREEK.—Shasta *Co. Democrat*, Mar. 3: Our reporter paid the above named mining camp a three days' visit last week and found the district alive with busy miners. Kennett Station is the principal connecting point with the railroad.

THE CROSSUS MINE.—Myers is getting along with the milling machinery in good shape. At the mine we found L. C. Graupner superintendent. A force of men were excavating the millsite, others were whipsawing lumber and not a few framing heavy mill timbers.

THE PECK-A-BOO MINE.—Next on the belt is the prospect owned by Fred Simonds Jr., Jack Depanger and George Crowder. They have erected a small cabin and started a tunnel on a two foot vein which prospects first-rate. Their prospect is encouraging.

OTHER MINES.—Still further north a few hundred yards are the McTimmons Bros.' and Marshall's claims. They have erected a good cabin and are diligently at work prospecting their ground.

Sierra.

RUBY.—Mountain *Messenger*, Mar. 6: The total weekly cleanups for the Ruby drift mine for February was 547½ ounces. About 40 men are employed. Width of gold lead, 150 to 200 feet. Bench of pay gravel, 15 feet above channel—westward—width unknown. Main tunnel is being run north, mainly in hard blasting bedrock, blue and gray in color with some water. Gravel of a grayish tinge and dry. Gangways extend westward. Gold mostly coarse. Two nuggets weighing 12 and 16½ ounces were found last month. About 900 carloads of pay gravel is rolled out per week, six days, day and night shifts, averaging about \$3 per carload. Gold assays over 900 fine. The bedrock and gravel in the west drift on the bench are white-colored, same as at the Eldo mountain, and through which mine extends at least 2000 feet of this rich gold lead.

BALD MOUNTAIN EXTENSION.—The total sums of the cleanups of the Bald Mountain extension drift mine, Forest city, for the month of February was 502 ounces and 14 pennyweights, \$10,400.50. The regular monthly dividend, (No. 8) was declared and paid March 1st, at Scanman's bank. The gold channel is widening, and the west rim, at last accounts, was being followed 34 degrees east of north. Swelling bedrock has seriously retarded work of late in the main tunnel. A 19-ounce nugget was found in the cleanup last week. The total yield of the Young America quartz mine, Sierra city, to date is \$70,000.

Trinity.

WEAVERVILLE.—Cor. Shasta *Courier*, Mar. 3: The hydraulic mines have already done as much work as they did all of last season, and several months of sluicing ahead yet to hear from. Our quartz mines are still holding a foremost position and yielding right along. Deadwood district is, without doubt, the boss in the State, while New River is beginning to recover from the effects of the boom of last year and will before long cope with Deadwood in the production of the "yellow truck." East Fork is doing something and will be no small affair in adding to the billion products of Trinity in the near future. Trinity and Shasta will yet occupy the top shelf as the boss mining counties of the State. We have the material and enterprise, and capital is what we want to make things hum. It is bound to come sooner or later.

Tuolumne.

NEW DEVELOPMENT IN THE KELTZ.—Union *Democrat*, March 4: Last week Mr. Louis Blanding, the mining engineer, visited the Keltz mine in Tuolumne county, on the Stanislaus river, in company with and at the request of Mr. Sharwood, of Soulsbyville. He made a close examination of the new development on the Keltz mine and took samples from every opening made along the line for test as to the character and value of the ore. He regards the discovery of the new body of pay ore in the mine, from three to five feet wide as very important, and that it greatly enhances its value, and in case the ore body holds in depth, and every indication points to this as probable in the highest degree, that the mine is one of great value, and when the tunnel reaches the pay chute, which it will do when driven about 150 feet further and the stopes are opened, that the present 10-stamp mill will require to be enlarged to 20 or 30 stamps to handle the ore coming out. The vein at the point where the ore body was found is strong and bold, perfectly defined with a good clay gouge, of regular dip and the ore of fine quality. The ore carries iron, copper, zinc and lead sulphurets in fair quantity—the percentage of sulphurets exceeding the average of most California quartz mines. He deem

the presence of the zinc and lead sulphurets specially worthy of note and indicative in this mining section of California of certain promise for the profitable future of the mine. This new development will avoid all pumping and hoisting expenses as the mine will be worked through the tunnel that leads on a level to the mill. Mr. Blanding expresses himself as highly pleased with the ingenuity and mechanical skill shown by Mr. Shawwood in all the details of the plant on the mine, and believes from his extensive experience and minute acquaintance in every mining district in California, that there are few if any its equal in these respects.

SEATTLE.—Tuolumne Independent, March 4. Mr. A. P. Johnson, at the Sell mine, is still taking it out rich. This mine has for years proved one of the best mines about Sonora. The Mornio mine, belonging to the Gross brothers, at Tuttle town, and the Margoret, owned by Jim Gillis, have been bonded to Lane & Co. Krouse & Wagner are running in the old Valparaiso tunnel on Table mountain, out of which some Chilenos took out a \$500,000 pocket and had a big fight over the divy in early days.

NEVADA.

Washoe District.

SIERRA NEVADA.—Enterprise, March 9: On the 520 level west crosscut No. 2, has been advanced 64 feet; total length, 116 feet. The formation at the face is porphyry.

CON. CALIFORNIA AND VIRGINIA.—On the 1400 level the drift running southwest from the west drift has been extended 65 feet; total length 257 feet, and timbered up to the face. On the 1050 level the northwest drift has connected with the old stopes. During the week 1103 tons and 235 pounds of ore were shipped to the Morgan mill, and 1079 tons and 795 pounds to the Eureka mill. The average value of ore milled during the week, according to assays from battery samples, was \$15.51 per ton for that crushed at the Morgan mill, and \$13.36 for that crushed at the Eureka mill.

OPHIR.—On the 300 level the west drift from the old Mexican shaft has been extended 41 feet; total length 233 feet. On the 400 level the north drift from the old Mexican shaft has been extended 36 feet; total length 252 feet. On the 700 level the joint Mexican and Union drift, running northwest from the Ophir shaft through Ophir ground, has been extended 47 feet; total length, 470 feet. This drift has entered Mexican ground.

OSBORN SHAFT.—Last Thursday connection was made with the third line of pumps 2128 feet below the surface. The pumps will hold the water at this point until the surrounding ground is drained.

GOULD AND CURRY.—On the 600 level the south drift has been cleaned out and timbered 44 feet; total distance from the main west drift, 223 feet.

MEXICAN.—On the 500 level east crosscut No. 2, running from north drift No. 2, has been extended 37 feet; total length, 179 feet.

UNION CON.—On the 500 level north drift No. 2 has been extended 37 feet; total length, 192 feet.

ARIZONA.

NOGALES.—Cor. Tombstone Epitaph, March 6: Nogales is not honeycombed with mines like Tombstone, but it is a good point for reducing ores from Mexico, and this business will soon assume large proportions. The smelter is progressing as rapidly as could be expected, and will probably be ready to commence reducing ores by April 1st. A great impetus has already been given to mining in the vicinity by the erection of a smelter in Nogales. The war against the Yaqui Indians will retard business in southern Sonora until it is terminated, when a fine country will be opened for improvement. The coal fields of this region have been sufficiently investigated to assure their early development, and they will furnish the motive power for great industrial enterprises west of the Sierra Madre.

IDAHO.

NORTH STAR.—Wood River Times, March 3: About two weeks ago an important development was made in the North Star mine, on the East Fork of Wood River, in an entirely new portion of the mine. The men at work there unexpectedly cut into an ore vein whose existence was hitherto unknown. A cross-drift run through the vein since has shown it to be fully 24 feet wide, and to contain a thickness of several inches of first-class ore, while the remainder will probably concentrate in the proportion of seven to one. This discovery having more than doubled the value of the mine, the Philadelphia Mining and Smelting Company will doubtless lose no time in perfecting arrangements to erect the 5000 foot tramway between the mine and concentrator, which they have had in contemplation, as this has now become an absolute necessity. All the dumps at the mine are jammed with ore, but none of it can be hauled at present, owing to the dangerous condition of the grade at the mine.

OWYHEE PLACER MINES.—Silver City Avalanche, March 6: The place, diggings recently discovered near Glenn's Ferry, in Owyhee county, are attracting considerable attention, and drawing thither swarms of prospectors. The only difficulty in making them pay well is to get water on them. There are thousands of acres of placer mining ground along the banks of Snake river that would pay well if water could only be brought on the ground.

MONTANA.

BUTTE.—Miner, March 3: The Montana Copper Company's series of mines are not worked on a very extensive scale at present, although considerable work is being done on them. The principal work being done is conducted on the East and West Colusa mines. At the West Colusa prospecting is the order of the day. There are several large ore bodies laid open in this mine ready for the drill and pick, but not a pound of ore will be taken out, says Superintendent Raunheim, until copper advances in price. Both of the Colusas are looking grand, the furnaces are in good trim and the entire works could be started up at a day's notice if it was required. There are sixty men at work in both mines. The Parrot never looked as well as it does at present. There are 110 men employed in and around the mine.

THE MORNING STAR.—This mine is located on

Montana street, and is owned by Messrs. W. A. Clark and Adam Faraday. It has been nearly two years since anything has been done in the mine and it is now full of water. It is 200 feet deep and has a good record as an ore producer. Yesterday the mine was leased by its owners to Messrs. Bews Bros. and Wash, Hutton. They have a fourteen months' lease of the Morning Star, and intend to immediately erect a pump in the mine and clear it of water. The late acquisition is worked on lease by Messrs. Snell, Pascoe, Job, Kodda, Eddy and Edwards who have a force of twelve men employed. On the 120-foot level of this mine a rich ledge of silver-bearing ore has been discovered, that is yielding well. The Alice mine remains about the same. All portions of the property are looking and producing well, and bid fair to continue so for a long time to come. The Moulton mine looks better to-day than it ever did before. A rich ledge was encountered last Friday in a winze that is being sunk in the bottom of the 300 foot level. This winze is now down fifty feet and is improving as depth is attained. The other parts of the mine are looking well and producing the usual quantity of ore. The mill is running in a very satisfactory manner.

THE WILD BILL.—This mine has been worked on lease by the Bews brothers and Mr. Hutton. A vast amount of work has been done by this worthy company of men while the results have been highly satisfactory to them and to the owners of the property. Last week Messrs. Bews & Co. sold their lease to Walter McKee, who it is claimed represents the Anaconda Mining Company. Star of West is worked on a lease by a large force of miners who have elected Sam Hoar as their superintendent. On the 28th of January, Messrs. Hoar & Co. commenced to sink a new surface shaft on their mine, that has now attained a depth of 100 feet. This shaft is to be sunk 400 feet. Agent Goodale who is the representative of the company owning the Star West is fully satisfied at the way the leasers are carrying on work on the property. This ore is being reduced at the California smelter. The mine is leased to Messrs. Hoar & Co. for eighteen months. Since taking the mine they have put up a new iron Ray hoisting engine and a fine new Cameron pump. There is no difficulty found in handling the water in the shafts. There are twenty-five men at work, and everything is running as smooth as oil.

MINOR NOTES.—The Self Rise mine at Burlington is worked on lease by Messrs. Stephens & Co., who are doing some hard work on the property with gratifying results. The Burlington mine worked by Messrs. Madden, Job & Co., never looked as well as it does at present. The Nettie mine, leased by Messrs. Harvey, Bastian & Co., is producing an immense quantity of ore that is being reduced at the Lexington mill. At the Lexington mine, the sinking of the main shaft is carried on energetically. The mine looks favorable. The Pacific mine looks well and is giving up its hidden treasures in a very liberal manner. The Rock Island never looked better than at present and the men at work there are correspondingly happy.

A BIG STRIKE.—Butte Traction Talk, Mar. 27: As we go to press we are informed that an important strike was to-day made in the Germania mine—the property on which the late unfortunate Oxman met his fate by being drowned. The foreman, while prospecting through the works, they having been just cleared of water, discovered traces of ore on an old stope on the 150-foot level. Proceeding to develop the same, he shortly uncovered a vein of very rich ore, about two feet in width, and containing native silver, visible to the naked eye. A sample shown us will easily assay 2000 ounces to the ton.

POOR MAN'S JOY.—James Patten is still pushing the incline, the header in pay rock. There is enough ore in sight in this mine to warrant some solid corporation in stocking and thoroughly prospecting it. In every level of the Frisbee shaft there is not less than four feet of solid quartz, averaging throughout better than 35 ozs. The present owners have enough of this world's goods to hold on and develop slowly, but it would be a red letter day for the camp if Patten, Caplice, Smith & Co. would stock up the property and push the work on a more extended scale.

NEW MEXICO.

MAGDALENA DISTRICT.—Socorro Bulletin, March 2: Col. Eaton is still working his claims and is putting a new-style concentrator in his plant. Eaton & Wanless are working their extension of the Grand Tower, and shipping mineral. The Brittenstein M. & M. Co.'s plant is steadily turning out amalgam and concentrates, and the group owned by this company still affords regular supplies of pay dirt. The Kelly mine, is shipping continuous supplies of mineral. The Juanita tunnel continues to enter the flank of the mountain, and a few feet only remain before the shaft and tunnel connect, so as to ventilate the mine. Comanche Jack shipped nine tons of his gold ore to the Billing smelter two weeks ago. We are informed that it netted him and his two partners \$75 in gold per ton.

MISCELLANEOUS.—The late work on the Comet has decided it to be a very valuable silver property. Tom Farley & Co. sent six men to San Acasio to work the Tom Farley, the Old Boy and the Tenderfoot mines. Wm. Whitacre of the Ladrona district is in the city. He reports the Florence and Monitor working and looking way up. Donald McRae is blasting and sacking high grade chloride of silver ore out of his Lawrence mine.

THE KINGSTON MINES.—A rich strike of ruby silver is reported from the north Percha camp. Judge Wm. Burns has sold the Galileo mine to Socorro parties for \$8000 cash, and also bonded to the same parties two other properties for a large amount. Wm. Boyle bonded an interest in the Keystone not long since for \$2000 and was offered \$10,000 this week for his bond. Forty thousand dollars has been offered for the Keystone.

OREGON.

PROSPECTING.—Baker City Democrat, March 3: Prospectors are tramping over the hills southwest of town, and, in fact, on all other hills where the snow has disappeared. We know of one discovery made already this spring, and there will be dozens of others made before long. There are a number of prospectors awaiting the opening of the season on Pine Creek, and in the meantime they improve their time

by looking for mineral in this vicinity. Another discovery similar to the Virtue would be a fine thing for Baker and who knows but what it may be made. George Cooper and two other miners are now engaged in the tunnel claim of Cooper & Dale, near the Virtue mine. It is proposed to run the tunnel in about 500 feet to strike the extension of the Virtue. The tunnel is in about 400 feet at present, and they expect to have it completed by the 1st of May. For the first 100 feet Cooper, who was working alone made rapid progress, but since that time they have been working in rock. Several parties have attempted this work before, not realizing the immensity of the undertaking, and the most persevering heretofore failed to run in 100 feet. The parties now engaged in the enterprise have shown commendable pluck and energy and we hope to see them rewarded as they deserve.

UTAH.

REVIEW.—Salt Lake Tribune, March 5: The receipts in this city for the week ending March 3d, inclusive, were: Bullion, \$104,377.74; ore, \$72,762.68; total, \$177,140.42. For the previous week the receipts were \$196,579.69, of which \$131,052.30 was ore and \$65,527.39 was bullion. The Ontario bullion output for two months is as follows:

January	111,792.37 fine oz.
February	118,088.19 fine oz.

Total	229,880.56 fine oz.
Its ore sales were—	
January	\$60,872.33
February	61,054.19

Total	\$121,926.52
-------	--------------

Being a total product for the two months, reckoning silver at \$1.02, of \$356,404.70. The Daly, along the Ontario vein, is now in first-class productive condition. Its ore sales for two months were as follows:

January	\$28,455.20
February	31,662.06

Total	\$60,117.26
-------	-------------

It will, from henceforth, report bullion from its Marsac mill at Park City, which is operated by the Daly company in reducing the ores of that great mining property. The mill is working most satisfactorily. It is a complete 30-stamp silver mill combining the most modern machinery and appliances. It has been gradually working up in capacity ever since being started last month, and has now reached the grand result of 53 tons of ore per day being crushed and discharged through the thirty-mesh screens. The mill employs fifty-four men to operate it successfully. That the reader may better understand the good results achieved, we give the workings of the Ontario mill, which has always been considered one of the best in the country. The Ontario has forty stamps, operates ninety men and crushes on an average seventy tons of ore per day, discharging the pulp through the same sized screens as the Marsac. This makes 3533 pounds per day for each stamp in the Marsac mill, while in the Ontario it is 3500 pounds per stamp. The batteries in the Marsac being new, are in better condition for doing fast work than the Ontario. The Daly ore worked in the Marsac is harder than the Ontario ore, and in both mills the same sized screens are used. The question of size of screens is an important one, hence the experience of Mr. Chambers in this respect will interest our readers. At first the Ontario mill used screens forty meshes to the inch, and afterwards made various experiments in screens ranging from forty down to twenty-eight meshes. Careful tests were made in results of chlorination and records kept of the amount of ore pulped per day. It was found that chlorination was just as good with a thirty-mesh screen as with a forty, and that with the former the mill pulped ten tons more ore per day than when the fine screens were used. This change of screen virtually increased the capacity of the mill 15 per cent without adding to the cost of operating. When the forty mesh was used, the pulp was held in the batteries until much of it was reduced so it would pass through a sixty-mesh sieve. It is by close attention to details, the providing of the best machinery and adaptation of the best processes that the Ontario has been made such a great property and enabled the company to pay its millions in dividends. The base bullion receipts of the week aggregated \$13,320. The bullion product of the Hannaer smelter for the week was \$22,740; of the Germania eight bars, \$20,613.51. The Siomont sent up three bars from Silver Reef, \$5330. One gold bar was received on the 26th from the Kentuck G. and S. M. Co., \$11,350.

PARK NOTES.—Record, March 9: A new tailing dam is being constructed by the Marsac mill immediately back of Fennemore's store, and barns and other outbuildings that have been built on that property are being removed by a force of company employees. The Anchor shaft is down to a depth of between 300 and 400 feet. Two pumps keep the shaft clear of water at this depth and the probabilities are that no more will be required, as the ground is undoubtedly drained by the Daly and Ontario mine, it being, as is supposed, on the same ledge, Mr. Chas. Barnycott and a party whose name we did not ascertain, are prospecting below town on the hill near the Empire mill site and feel much encouraged with the showing they have got. They have run a tunnel 200 feet for this winter. A force of men are at work at the concentrator removing the machinery from it and grading preparatory to the proposed enlargement. As soon as lumber and other necessary building material comes to hand, a force of carpenters will be put to work and everything will be pushed to completion, so that work may be begun on the concentrates as soon as the tramway is clear of snow. A visit to the Creole mine, owned by D. A. Condo, showed that Dave and a party who is leasing part of the property were doing their level best to keep this mine among the ore producers of the camp and a look at the ore dump and the ore in sacks showed that their efforts were not in vain. The Creole will certainly make a good paying mine, and every bit of work that is being done on it, goes to demonstrate this fact.

THE STORMONT.—An average of thirty-eight tons of ore, per day, was bailed from the mines to the mill last week. The main incline in the Savage & Buckeye, is down 144 feet below the 600-foot level. A cross-cut will be started for the hanging-wall this week.

List of U. S. Patents for Pacific Coast Inventors.

From the official report at U. S. Patents in DEWEY & Co.'s Patent Office Library, 252 Market St., S. F.

FOR WEEK ENDING MARCH 2, 1886.

337,887.—FIRE ESCAPE—Jos. Ben, S. F.
337,122.—ORF CONCENTRATOR—F. H. Blake, Pinal, A. T.
336,697.—ELECTRICAL BRUSH—Jas. D. Culp, San Felipe, Cal.
336,898.—ELECTRICAL TORCH FOR LIGHTING GAS—James D. Culp, San Felipe, Cal.
337,136.—WASHING MACHINE—E. W. Dixon, Yakima, W. T.
337,220.—MUSICAL KEY INDICATOR—O. H. Goodwin, S. F.
337,272.—POLARIZED TELEGRAPHIC RELAY—J. C. Ludwig, S. F.
337,018.—TREE FELLER—W. G. Rendall, Portland, Or.
336,946.—PLOW—T. Reyner, Lathrop, Cal.
337,025.—UT-OFF VALVE—John P. Simmons, S. F.
337,029.—DRUM ATTACHMENT FOR PIN RAILS—A. F. Spear, S. F.
337,036.—CLINCHING PUNCH—John R. Watson, Sacramento.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect accuracy, at reasonable rates, and in the shortest possible time.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department 10, San Francisco:

BLACKLOCK SANDSTONE CO. March 7.—Object, quarrying sandstone in Curry county, Or. Capital stock, \$100,000 in 10,000 shares. Directors, John Blacklock, W. H. Martin, Herman Shainwald, C. G. Kenyon and R. L. Shainwald.

CALIFORNIA HISTORICAL SOCIETY, March 7.—Object, to collect historical information. Directors, Wm. Ashburner, Horace Davis, Joseph A. Donahue, John T. Doyle, Edward S. Holden, Ralph C. Harrison, John R. Jarboe, Bernard Moses, J. De Barth Shorb, Wm. Norris and A. Varsi.

TULARE LAKE AND KING'S RIVER CANAL CO. March 7.—Object, constructing canals and ditches to take water from Tulare lake and King's river and convey the same to the tillah lands in Fresno, Tulare, Merced and Stanislaus counties. Capital stock, \$600,000, in 600,000 shares. Directors, E. Fair, H. C. Willson, B. P. Jenkins, W. L. Richardson and Wm. Shrader.

Mining Share Market.

No special activity is displayed in the mining share market. There is less business done in stocks in a month now than there was in a day, eight or ten years ago. On the Comstock, however, they are working harder than ever to make some development which shall again make affairs lively there. On the first of this month the following companies had each on hand: Best and Belcher, \$34,402.08; Alpha Consolidated, \$2,256.47; Chollar, \$10,727.47; Exchange, \$5,678.02; Gould and Curry, \$4,514.57; Occidental, \$1,832.27; Utah, \$6,436.34; Sierra Nevada, \$13,403.36.

The following companies had indebtedness: Con. California-Virginia (overdraft), \$63,387.33; Hale and Norcross, \$1,222.58; Potosi, \$10,679.38; Mexican, \$490.85; Ophir, \$861.42. To offset the indebtedness shown by the Con. California-Virginia, the company has \$58,929.54 assay value of unsold bullion on hand, and several more bullion shipments to be received to complete the February account, and the expenses of the mine for that month are partly paid.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Lexington, March 2, \$45,644; Hannaer, 3, \$8450; Germania, 3, \$2081; Kentuck, 3, \$11,350; Stormont, 4, \$1970; Germania, 4, \$4205; Hannaer, 5, \$3740; Germania, 5, \$2049; Hannaer, 6, \$3,400; Germania, 6, \$4527; Alice, 7, \$14,661; Hannaer, 7, \$6840; Germania, 7, \$2193. Last week Wells, Fargo & Co., at Salt Lake, received in bullion \$57,010; McCormick & Co., \$59,840; T. R. Jones & Co., \$37,266, and Union National Bank, \$30,025.

Meetings and Elections.

ANDES S. M. CO., March 9.—Directors, W. E. Sell, Joseph Marks, J. T. Bridge, A. K. P. Harmon and A. W. Rose.

HALE & NORCROSS M. CO., March 9.—Directors, H. M. Levy, E. B. Holmes, Morris Hoefflich, Jacob Greenebaum, L. P. Drexler, George W. Grayson and A. Borland.

The Idaho Statesman says: The Cœur d'Alene papers anticipate a big boom in mining operations in that section this year. The mines that were worked paid handsomely last year, and the general opinion among mining men is that the Cœur d'Alene will open up into the biggest mining camp in Idaho. May their anticipations be realized.

Gardner Spring Governor.

TATUM & BOWEN,

25 to 31 MAIN STREET, SAN FRANCISCO, CAL.

91 to 93 FRONT STREET, PORTLAND, OR.

SOLE AGENTS FOR

GARDNER GOVERNOR COMPANY,

J. S. Mundy's Patent Friction Hoisting Engines.

The Mundy Patent has been sustained in the United States District Court of New York against the Ledgerwood Manufacturing Company, and also in the District Court in the State of New Jersey against Kendall & Roberts for infringement. Therefore all parties are cautioned against making, using, or selling Friction Drums that infringe this patent.

Gardner Governor.

GORDON & MAXWELL COMP'Y MINING PUMPS.

THE MOST EXTENSIVE PUMPING MACHINE WORKS IN THE UNITED STATES.

MORRIS COUNTY MACHINE and IRON CO. New High-Speed AIR COMPRESSOR.

We have recently furnished the contractors the machinery for La Trinidad (300 tons per day) and Silver Queen (100 tons per day). These mines are located in Mexico and belong to La Trinidad Company, of London. The Process is the Wet Concentration, and the Plants are, without doubt, the most substantial and complete of the kind ever built.

WE MANUFACTURE ENGINES, BOILERS, AND SAW-MILL MACHINERY, and Carry in Stock:

Wood and Iron Working Machinery, Best Belting, Lubricants for Cylinders and General Machinery, Including the Celebrated ALBANY LUBRICATING COMPOUND.

Centrifugal Roller Quartz Mill.

F. A. HUNTINGTON,

MANUFACTURER OF

Centrifugal Roller Quartz Mills,

CONCENTRATORS AND ORE CRUSHERS,

Mining Machinery of Every Description,

Steam Engines and Shingle Machines.

SEND FOR CIRCULAR.

No. 45 FREMONT STREET, - - SAN FRANCISCO, CAL.

ORE CRUSHER.

NOTICE TO MINING MEN! SILVER PLATED AMALGAMATING PLATES FOR SAVING GOLD!

Get our Prices before ordering elsewhere. Samples furnished on application.

SAN FRANCISCO NOVELTY AND PLATING COMPANY, No. 21 Stevenson Street.

JUSTINIAN CAIRE, Dealer in Mining Material, Agent, 521 & 523 Market St., San Francisco.

NOTICE TO MILL MEN.—All our plates are guaranteed to have the Full Weight of Silver agreed upon, and are all tested before leaving our Works, thereby avoiding the complaints about light-weight, made so often formerly before our starting in this branch of business. PLATES CAN BE FURNISHED AT ANY PRICE REQUIRED.

JAS. LEFFEL'S TURBINE WATER WHEEL "The Old Reliable,"

With Important Improvements, making it the

MOST PERFECT TURBINE NOW IN USE,

Comprising the Largest and the Smallest Wheels, under both the Highest and Lowest head used in this country. Our new Illustrated Book sent free to those owning water power. Those improving water power should not fail to write us for New Prices before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address

JAMES LEFFEL & CO.,

Springfield, Ohio, and 110 Liberty Street, New York, N. Y.

FRASER & CHALMERS, General Agents.

Chicago, Ill., and Denver, Colo.

PARKE & LACY, General Agents, 21 and 23 Fremont Street, San Francisco, Cal.

PATENT LIFE-SAVING RESPIRATOR

Entirely Prevents Lead Poisoning and Salivation

The most perfect appliance for people engaged in Smelting, Dry Crushing, Guano Works, Quicksilver Mines, Lead Corroding, and all other occupations where there is dust, poisonous vapor, or bad odor.

In Feeding Threshing Machines, and similar work, they are indispensable, as no foreign substances can be inhaled when they are worn.

The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, \$3.00 each or \$30.00 per dozen. Sent post-paid to any address on receipt of price.

THE NEW CIRCULAR STAMP BATTERY.

Quartz men for years have endeavored to find a substitute which would combine the simplicity and efficiency of the ordinary straight battery and do away with the clumsy and expensive frame work. Many new machines have been brought forward, but have proved inadequate, and quartz men generally have determined that stamps are still to be accepted as the most economical and effective. In view of this fact I have closely applied myself for years to overcome the objectionable feature of the straight battery, notably, the cumbersome work, which is always more expensive than the iron-work, and yet retain the stamps. In this I have succeeded and know the battery now presented will meet the approval of all practical mill men. The points gained are as follows:

- 1st. It is in every detail as to feed, tappets, stems, shoes, dies and boxes, the same as the ordinary battery. It is simply a straight battery thrown into a circle and so constructed that the iron work is self-supporting, doing away with all the old work, and the structure rests upon its foundation more firmly than a wooden battery possibly can.
- 2d. The application of power is nearer the base than in any ordinary battery consequently there is less leverage and less vibration.
- 3d. The foundation for battery will not cost ordinarily over \$75.00.
- 4th. A 12-stamp mill will not require a larger building than an ordinary 5-stamp straight battery. Hence a great saving in lumber and labor.
- 5th. More quartz can be crushed for power expended than by a straight battery, as there are no "end stamps" to impede work, and the discharge surface is much greater.
- 6th. It is a good amalgamator on account of the circular motion given to the ore during reduction, as 85% to 90% of the metal is retained inside of the battery.
- 7th. Foundation and power being ready, the mill can be erected and running in three days after it is delivered on the ground, thus saving in working time enough to pay the cost of a mill.

ALMARIN B. PAUL.

These mills are built with 8, 12 or 20 stamps in one mortar, and when ready for work, will cost a great deal less than an ordinary straight battery.
Parties desiring Stamp Batteries, will do well to investigate this mill, which can be seen at the Works on a large practical scale, and by model at the office. They will be sold on favorable terms.
For particulars apply to

ANNOUNCEMENT.

The Clayton Air Compressor Works, of Brooklyn, have opened an office at No. 43 Dey Street, New York, for the sale of the Clayton Improved Air Compressors, Rock Drills, Mine Pumps, Hoisting Engines, Rock Crushers, Blasting Batteries, Wire, Fuse, and Mining Machinery in General. For Catalogue—August 1885—estimates and general information call upon or address, Clayton Air Compressor Works, Office, 43 Dey Street, New York.

[From the Engineering & Mining Journal, Aug. 8, 1885.]
The Clayton Air Compressor Works have issued a New Illustrated Catalogue and Price List. Every Mine Manager and Engineer should have a copy for reference, for none can afford to be without the information there given concerning the unsurpassed Clayton Air Compressors and other Machinery.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Cokes having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake. This undersigned are the SOLE IMPORTERS of the above Cokes, which is for sale in quantities to suit purchasers.

THE JENKINS STANDARD PACKING

IS ACKNOWLEDGED BY USERS AS THE BEST in the world. Unlike all other Packings, the Jenkins Standard Packing can be made any thickness desired in a joint by placing two or as many thicknesses together as desired, and following up joint, it vulcanizes in place and becomes a metal of itself (it is frequently called Jenkins Metal), and will last for years, as it does not rot or burn out. Avoid all imitations, as a good article is always subject to cheap imitations. The genuine has stamped on every sheet "Jenkins Standard Packing," and is for sale by the Trade generally.

GOLD MINES

AND
Mining in California.

The new book with above title is one in which all gold miners will be interested. It describes the Quartz, Hydraulic, Dredge and Placer Mining Methods, and progress and improvements made in the BUSINESS of Gold Mining. California is a grand field for the profitable investment of capital. The AUERERUS Regions are described, each County being separately treated, and the mines producing brilliant or in course of development are referred to. The appliances in use are described. Those who wish to know how and where gold mining is carried on in California, want this book.
Price, \$1.50, sent by mail, postage paid, on receipt of price.

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.**

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS.
(\$575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco. As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement. The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them. Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for. N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Room 7—No. 109 California Street.

SAN FRANCISCO, CAL.

\$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

THE

"TRIUMPH" ORE CONCENTRATOR.

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFLE TABLE, placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

RANKIN, BRAYTON & CO.,
...BUILDERS OF...
MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE TRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist-and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

VOLUME LII
Number 12.

The Canadian Pacific Railroad.

The Canadian Pacific Railroad is finished—that is as far as grading and track laying is concerned—ons terminus being Halifax and the other Victoria, but the difficulties are by no means over. Even when the officials went to see the last spike driven, they were delayed several days by slides, and it is probable they will have great trouble from that source for a long time to come. In conversation with Mr. G. H. Behm, who has been connected with the construction of the road, we learn some interesting facts concerning the road. It is his opinion and that of many others familiar with it, that they will always have difficulty in keeping the road open in winter on account of the very heavy snows and the danger of slides. The road runs through sections of country where they really do not know what the winters are. For hundreds of miles there are no settlers and even no Indians. Great agricultural possibilities are expected all along the line and immigrants are to be induced to settle, but those who have been along the road do not greatly encourage the idea.

Near Victoria, at the western end, the country is good, but in the Rockies it is very bad, and the engineers had great trouble. In many places the men had to be lowered with ropes to cut out the plans for the road bed. Our informant thinks it doubtful if the road can ever operate continuously in the winter. In some places there was 25 feet of old snow when the new snow came. The heavy winter winds also cause trouble from the drifting of the snows.

In some places along this road after the track was laid along the sides of the canyons it was completely covered, so that it had to be abandoned and tunnels run. It is probable that many more tunnels will also have to be made. Even if the trains run regularly, those familiar with the country consider it doubtful if the road will ever pay. As far as the country through which it runs is concerned it will furnish very little freight and few passengers. No snowsheds have so far been built in the mountains. In some places there is a five per cent grade. In ascending the mountains they have a loop in the circle of a mile at the summit of the Rockies. In descending they cross a ravine on a bridge which is 295 feet high.

Between Winnipeg and the Rockies there is some farming done, but a good deal of the region is alkaline and of little use. It is said, however, that the track runs through the worst part of the country and 30 miles back there is good farming land. The prairies are low and level and filled with ponds and lakes, which in summer dry up. This character of land extends over 1000 miles or more.

A great deal of work still remains to be done on the track in the matter of grading, leveling and ballasting. It is not straightened and put in good order yet. They are not now running through trains. Mr. Behm does not see how the Canadian Pacific is going to do much damage to California interests in any way.

A few colors of gold have been found in the mountains along the line of the road, though little prospecting has been done. Old mining men who saw the ground did not get excited over it. Still it is probable that in spring some little "boom" may be arranged, mainly in the interests of the railroad.

SLUCE robbers have been operating at drift mines in Nevada county.

A Big Mining Shaft.

Among the numerous objects of interest in Mexico, there is none so well worthy of a visit as the shaft of "Valenciana," near Guanajuato. From the Plaza Grande, in Guanajuato, this shaft is distant about three kilometers in a northeasterly direction.

The shaft was commenced by the Count of Valenciana in the beginning of this century. The property subsequently fell into the hands of an English company, but was abandoned by them on account of the influx of water, which they were unable to handle.

After lying idle for over 40 years, the prop-

erty, a few years since, came under the management of the distinguished mining engineer, Francisco Glennie, through whose energy and ability the mine has been unwatered, and the shaft is once more the means of communication with the ore bodies of the mine.

We are indebted to E. C. Van Blarcom, who visited the mine not long since, for a descrip-

tion of the shaft. The shaft is octagonal in shape; it is 10 meters (32.8 feet) in diameter, in the clear, and is 530 meters (1738.77 feet) in depth. Formerly the hoisting was done by means of eight *malacates*, or horse whims, one running against each face of the octagon. The *malacates* have been replaced by four steam hoists. Three of the hoists are 22-horse power each, with single reel; the fourth, built in the United States, is a 50-horse-power double engine, with cylinders 356 millimeters (13.99 inches) long, and 609 millimeters (23.93 inches) stroke, spur geared and fitted with two reels for round wire rope; it is arranged to under and over wind. The cages and tanks run on guides of one-inch wire rope. The different engines are used indiscriminately for hoisting purposes.

The water is raised in a sheet-iron tank, which is reinforced with wrought-iron bands. The tank is arranged to fill and discharge automatically; these tanks have a capacity of 2300 kilogrammes (5070.8 pounds, or about 600 gallons) each; 1800 tanks or 4,140,000 kilos (say 1,080,000 gallons) of water are hoisted per day of 24 hours.

The amount of ore extracted varies so greatly that the daily output cannot be given.

A New Clinometer.

The accompanying cut is about half size and represents a new clinometer, designed by Mel-

ATTWOOD'S CLINOMETER. SHOWING COMPASS.

ville Attwood for the use of the miner and prospector. It can easily be carried in the pocket, and is made as small as possible consistent with accuracy.

E, is the graduated circle which is kept in place by a small spring at *A*, a slight pressure on the knob of which sets the circle free, and on the removal of the fingers the instrument

CIRCLE OF ATTWOOD'S CLINOMETER.

can be taken up and the angle of inclination easily read. *D* represents a compass for taking approximate bearings. *B* and *C* are small levels, one on the top and the other at the end of the instrument. With this clinometer and a small straight-edge the underlay of any metalliferous vein may be accurately taken, and in positions where a larger instrument could not be used; also the dip of any bed, or stratum of rock or seam of coal.

The timbering of any level, shaft or incline may be set by it. It can be used in quartz mills to give the proper angle to the silvered plates, blanket, trays and sluice boxes. The instrument is a very practical one, and is made in this city.

The Lick Observatory.

The finishing touches on the crown glass disk for the 36-inch objective at the Lick Observatory are now being given, the work being necessarily done by hand. The venerable Alvin Clark and his son are both at work on the glass. It will be but a few months more before the glass is finished, when it will be sent here ready to be put in place. The objective is tested by artificial stars, in the shop, and is then mounted on a temporary tube for tests with heavenly bodies. It is expected that it will take one and a half or two years to mount the glass after the polishing is completed.

The great dome to cover the 36-inch refractor will be constructed of steel plates. The entire dome will be 75 feet in diameter and will weigh about 93 tons. The north dome at the northwest corner of the peak of Mt. Hamilton contains one of Clark's 12-inch equatorial telescopes. In the center of this dome is a massive brickwork pier supporting the telescope mounting. The meridian circle house, resting on solid foundations of masonry, is completed and equipped, containing a 6½-inch meridian circle furnished by the Repsolds of Hamburg, mounted on brick piers set upon the rock foundation of the summit. This building is of peculiar construction, with double walls of iron and wood, affording an admirable system of ventilation. It has two collimators of 6½-inch aperture, and many convenient arrangements for scientific work. The *mire* stands 75 feet from the north end, and the south collimator is viewed through a lens fixed to the collimator pier.

Of portable instruments the observatory possesses a comet-seeker, a Repsold universal instrument, and a small equatorial mounting in which the 6½-inch objective of the south collimator can be used. The observatory is also liberally supplied with the necessary auxiliary instruments, such as electrical apparatus, chronometers and sidereal clocks, so that after the mounting of the great equatorial telescope its instrumental equipment may be regarded as complete. The observer's house, for the director of the observatory and astronomers who may be in residence there, was furnished in 1884. It will be several years yet before the whole observatory will be in order for systematic, original work.

CHEAP MINING LABOR.—N. H. Gim, a Chinese contractor, has sued the "Mine d'Or de Quartz Mountain Societe Anonyme" to recover \$40,000 for an alleged breach of contract. The plaintiff contracted in August, 1884, to furnish the defendant corporation with 360 common laborers, fourteen cooks, four interpreters and twelve blacksmiths, but upon December 30th the company ceased work and terminated the contract without giving two weeks' notice. The plaintiff therefore claims to have been damaged in the sum named, through being obliged to furnish the men with food, transportation, etc. In the complaint it appears that the wages paid by the contractor were at the rate of 25 cents per day for laborers, 30 for cooks, 40 for interpreters and \$1 for blacksmiths.

THE suit of the Champion mine against the Wyoming, Nevada City, will soon be decided. The plaintiff asks an injunction restraining defendant from further working in ground claimed by the former; also, for \$300,000 damages.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Dillon, Montana.

[From Our Traveling Correspondent, R. G. HUSTON.]

Dillon is the county seat of Beaverhead Co., 70 miles south of Butte, on Utah Northern railway, and is really a railroad town located in Beaverhead valley, 25 miles from the junction with Big Hole. It is surrounded by a fine agricultural valley and a good stock range also. At the present writing (Feb. 20th) the roads are dry and dusty and there is very little snow in the foothills, making it a stock owner's paradise for the winter.

Blacktail Deer creek valley puts into Beaverhead river some miles above Dillon and is the location of one of the finest stock farms in Montana, owned by Messrs. Poindexter & Orr. They have a range running up Blacktail valley some 30 miles, and they have a large number of thoroughbred horses. They have been engaged in breeding thoroughbred horses for nearly twenty years. There are many of the ranchers in these valleys who have large fine houses and barns and all convenient shedding for stock that would do credit to a much older country.

From general appearances Dillon was experiencing her dullest season at the time of my visit. The town has a population of 1400. It has one hotel, a number of restaurants and lodging houses, two banks, three or four fine general merchandise stores and the usual number of butcher shops and saloons. There is a

Fine Mining Country Tributary

To it. Argenta, 15 miles northwest of town on a large tributary of the Beaverhead, called Rattlesnake, is about half way on road leading from Dillon to Bannack. This town has been the location of three or four smelters at different times during the last 16 years, but for some reason they have never been successful in working the ores of the district; one reason has been that the leads are small and when the winter closes in they have no ore to run on and are compelled to shut down, and some of them have been poorly constructed and could not save the precious metals in the ore furnished in the summer season. At the present time there is but one smelter here and that is only operated in the summer season. The only leads that are making much of a showing are some three miles north from Argenta at what is called the springs. Messrs. Witter, Miles and Lawrence have a prospect called the Rena, and have a fine body of ore. It is hematite and carries a fine percentage of lead with from 20 to 40 ounces of silver, and from \$65 to \$80 in gold. They have an incline shaft down 65 feet and are now stopping on the 50-foot level. They are now working with windlass, but having struck a strong body of water in the shaft they cannot do anything below the 50 foot level. They will be compelled to put on pumping machinery before they sink any lower, and as far as they can see is a flattering prospect. A short distance from this and apparently on the same lead is a location called the Golden Era and owned by Geo. French. This ledge has a width of from five to six feet. Quite a number of tons of this ore was treated in the Argenta smelter and returned \$110 gold and eight ounces silver. The owner has a shaft down 55 feet and has stopped some. As he has not yet struck water he will have a chance to develop a good mine, at least he is now well satisfied with present prospects.

Bannack,

Located on Grasshopper creek, 25 miles from Dillon, west, is one of the first placers discovered in Montana, the first mines being struck here on the 17th of August, 1862, by some prospectors from Colorado. James Harby and William Roe, present residents of the town were with the party. For many years the camp has been lying dormant and not much was done in the way of developing any new placers or quartz mines, but those who have remained here so long seem now to be in a fair way to realize in future. During the past season Messrs. Williams & Co. have succeeded in getting bedrock in the main creek and worked a pit 20 feet square and cleaned up \$700. The gulch here is very flat and about 20 feet deep to bedrock, and as the bars all along have paid well down as low as they could work for water, it looks like a reasonable proposition that the main creek will be extremely rich. Messrs. Williams & Co.'s clean-up is now convincing proof that it will pay, and preparations are being made to systematically open the main Grasshopper creek. No doubt next season it will give employment to quite a number of men. These prospects in connection with the Blue Wing quartz district, which is within two miles of town, with other developments and machinery to be placed here this season make a fine showing for the old town of Bannack.

The Blue Wing District

Is two miles south of Bannack. The first mine of note that is now open and producing money is the Kent, owned by Messrs. O'Leary and Gallagher, who are taking out 100 sacks of ore

daily and shipping to Salt Lake and Omaha for treatment. The ore is yielding returns of an average of 150 ounces silver and a small amount of gold. They are well satisfied that they have a fortune ahead of them.

The Charter Oak is close by, and owned by Mike Herr, who is working in a modest way and shipping ore continually. The ore is the same character as that of the Kent, and it is thought that the owner is doing well.

The New Departure, owned and operated by Judge Brown, is a fine property. Two carloads of ore per month are being shipped, the returns averaging 200 ounces of silver. These are about all the producing mines here at present near town. There have been many others worked in the vicinity as far down as the free-milling ore went, but like some other districts in this Territory, as you go down the ore becomes base and the plant will not work it to a profit. The only mill in the town is owned by Phil Shenon, and he has successfully operated it for some years, but he is now figuring on putting in ten more stamps and remodeling it into a silver mill. By putting in a roaster he will be able to successfully treat many of the ores in the vicinity, and no doubt will have plenty to do, as the parties who are shipping ore from here have to select it and only ship the best; therefore a plant located here will get the benefit of all the second-class ore that may be lying around the dumps at all these mines. Mr. Shenon having ample means at his command, will no doubt make the works as complete as he can, and being a "live man" will push things along in fine shape.

The Bald Mountain District.

This district is 18 miles further up Grasshopper creek, and is tributary to Bannack for supplies and post-office facilities. The first mine in this district and really the one that has brought the district into prominence, is the Polaris. This is a contact vein, and owned and operated by Messrs. B. F. White, of Dillon and Phil Shenon and others of Bannack. The development thus far has been very satisfactory. There is a shaft down 85 feet, and some levels have also been run. They have shipped 200 tons of first class ore to Omaha, from which they realized \$30,000. The average size of lead as far as developed is nearly fifteen feet in width. It will run about 20 feet between walls, but 15 feet takes the most valuable portion of the lead. They now have 1000 tons of second-class rock on the dump that will average assay value of 40 ounces silver and \$6 to \$7 in gold and about 15 per cent lead, making even the second class rock a pretty good average and a good property to build a smelter on, and as all the parties operating this mine have ample means there is little doubt that at no distant day there will be one built for this mine. The mine at present shows a large enough body of ore to keep one of a pretty good capacity running on full time. The company are now employing 20 men developing and have just commenced to sink, intending to go down to the 200 foot level. When that is reached and the lead crosscut, it will be well developed. They have a very fine steam-hoist, the best in the county, not excepting the Cleopatra at Hecla.

The Odell mine is near by in this district and is owned and operated by the Dillon Mining Co., Thomas Connor, Sup't. They are working 12 men at the present time and have a large body of fine ore in sight. Reports say that a mill has been contracted for, to be in running order by June 1st. Their ore carries both gold and silver in paying quantities. Messrs. Garrett & Diment have also a fine showing in the Diment lode. They have shipped some ore of pretty high grade and realized \$80 per ton. The same parties have a number of other properties near here that look promising.

Elk Horn District

Is still further up the main Grasshopper creek about 10 miles. The Elk Horn mine was discovered a good many years ago, but owing to the character of the ore not much was done on it and it was relocated several times.

The Simpson mine is owned and worked by William Roe and Joe Gauthier, who are operating it in a modest manner, and shipping ore right along to the Omaha smelting works, realizing returns of about 100 ounces per ton, with which they are contented.

The Storm is the property of Wm. Roe, and is now being operated by O. C. Henry (a Colorado man) under a bond and lease. The amount of bond I did not learn, but as it was the first mine taken hold of by outside parties they probably have a reasonable figure. This is the best developed mine in the district, having a tunnel in 400 feet and a well-defined lead from ten to twelve feet wide. The ore runs on a close average about 100 ozs. to the ton. Mr. Henry is a wide awake man and seems to be well satisfied with his contracts.

The Red Sky is in close proximity and is owned by Mr. Fred North, but is now being operated by Messrs. Fyhrle and Cavanagh under a lease and bond of \$10,000.

The Meteor in this same district is owned by Potter and Timbey, is only a prospect, no developments being made beyond a shaft 12 feet deep from which they have had some fine assays ranging from 104 ozs. silver for the lowest and 300 for the highest. They have had offers to bond and lease but prefer to wait until spring opens and develop it themselves, and abide by the results. There is not much chance for outside prospecting in this camp in the winter as the snow falls very deep on the range of moun-

tains. It lies close up to the Salmon river range and is very cold. These mines are in the same range and only ten or twelve miles distant from the Hecla Consolidated Co. mines, consequently they are in a region that has some of the best dividend paying mines in the United States, which is a recommendation that should not be overlooked by parties seeking for investments in comparatively undeveloped mines. With but few exceptions in the different mining camps I have visited throughout the territory the outlook for the future is brilliant, and in most cases my opinion is backed and borne out and satisfactorily proven by the production; so that there is no pecuniary consideration influencing me in advancing my opinion.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

KILN FOR BURNING BRICKS.—Wm. Jones, S. F. No. 336,720. Dated, Feb. 23, 1886. This kiln is specially adapted for burning Portland cement or other substances with petroleum gas, coal or other suitable fuel; and it consists of a kiln built on independent movable sections or parts within which the material to be burned is placed; the ends of each section being left open and a temporary joint or coupling provided between their adjacent ends, whereby they may be converted in one continuous kiln, which can be moved as a whole, and each section of which, after its contents are sufficiently burned, can be disconnected for discharging and reloading.

FIRE ESCAPE.—Joseph Bien, San Francisco. No. 336,887. Dated March 24, 1886. This fire escape consists of a wire rope, cord or cable, a drum or reel on which it is wound and from which it is paid out, and a brake mechanism acting against the drum or reel and operated by the suspended weight to regulate the rotation of the drum. It further consists in a suitable casing on which the drum is mounted, provided with a bottom opening, and a roller for the emergence and guidance of the wire rope; oppositely moving bars, passing loosely through and pivoted to the casing, whereby the brakes are operated, pivoted levers and link by which the bars are suspended and in details of construction relating to the brakes and the guidance and operation of the several parts.

SACKING ATTACHMENT FOR THRESHERS.—C. F. Prentiss, L. G. Stone and H. Fisher, Woodland, Yolo county. No. 336,665. Dated Feb. 23, 1886. The grain when delivered from the cleaning-shoe of the threshing machine is usually received into a horizontal spout, through which it is carried to one side by a screw or auger which revolves within the spout, and as this spout is often too low for conveniently sacking the grain recourse is had to an elevator, by which it is raised and delivered into sacking spouts. In places where there are strong or prevailing winds it often brings the sacking attachments in such a position that the chaff and dirt from the machine are all blown to that side, making it very inconvenient for the sacker-tenders and sewers. It is often impossible to change the setting of the machine so as to overcome this objection. In this invention the mechanism is so arranged that the grain may be delivered at either side of the machine, there being sacking spouts and attachments at both sides, either of which may be used at will.

DRUM ATTACHMENT FOR PIN RAILS.—Alexander F. Spear, S. F. No. 337,029. This is an attachment for the belaying-pin rail of vessel, and it consists of a cylindrical drum and means for attaching it to the rail. In unloading a vessel there is rigged up to the end of the yard a tackle known as a "hurton," one end of which is attached to the fall of the engine or lifting rope, and the other end is usually passed back and forth over several belaying-pins in the pin-rail, which is protected by a bent plate called a "rail-hox." The function of the hurton, as is well known, is to guide the load over the side and slack it away, and this is done by the operator hauling in the slack of the hurton as the load is hoisted and slacking away again when in proper position to be lowered. So much friction is caused by the hurton slipping on the belaying-pin that it wears out in a short time and is rendered useless. A new rope or a fresh portion of a whole coil has then to be rigged. It is the object of the inventor to obviate the expense by providing a drum for the guiding rope or hurton, which takes the place of the ordinary rail-hox, and is adapted to be readily secured to the pin-rail.

BAND-SAWING MACHINE.—John J. Bowen, S. F. No. 336,693. Dated Feb. 23, 1886. This improvement in operating band-saws consists in the employment of a supplemental driving belt, extending between the upper and lower pulleys of the saw, said belt being deflected invariably upon one or both sides at points between the pulleys and having a tightening and compensating mechanism by which the tendency of the upper pulley to over-run will be checked, and the two pulleys caused to run more completely in unison. In the construction of band-sawing apparatus the lower pulley or wheel is usually driven by any suit-

able gearing, and the saw passing around this wheel extends upward, passing around a similar wheel at the top, which it also acts to drive, so that the two rotate and carry the saw. In order to give the saw sufficient hold, and also to cushion it properly, the faces of the wheels are usually covered with leather or some similar elastic substance, but this wears out rapidly and must be replaced at considerable expense of time and money. The saw is subjected to very considerable and irregular strains by reason of the tendency of the upper pulley to over-run or run faster than the lower one, especially in large saws where the pulleys are eight or ten feet in diameter. By the use of the supplemental driving belt, with the deflecting and driving pulleys invented by Mr. Bowen, this fault is corrected, as the belt holds the upper pulley and any tendency of the pulleys to over-run will cause the frame which supports the deflecting pulleys to move transversely in its guides, thus keeping both sides of the belt equally tight and preventing this difficulty.

HEATER FOR BARRELS.—John L. Koeter, S. F. No. 336,239. Dated Feb. 16, 1886. This invention relates to that class of heating devices which are used for heating barrels; and the invention consists in the construction of the smoke-flue within the cylinder of the heater, and in a surrounding casing extending but part of the height of the cylinder. The object of the inventor is to make as simple a heater as possible by incorporating the smoke flue in its body, and also, by means of the encircling casing, to equalize the heat and distribute it more evenly over the barrel.

VALVE ATTACHMENT FOR WINE CASKS.—Thos. S. Glaister, Sonoma. No. 335,751. Dated Feb. 9, 1886. Large wine casks are provided with a door in one end or head, near its lower portion. In this door is a bung-hole, which is closed by a plug. When the wine is ready to be drawn off the plug is removed and the faucet inserted. Sometimes the plug is removed outwardly, in which case several gallons of wine are wasted before the faucet can be seated on the bung-hole, for the casks are so large that there is a great pressure of liquid, and it spurts out with much force, rendering it somewhat difficult to insert the faucet. Sometimes the plug is driven inwardly by the faucet, which is subjected to blows to this end, and by following the plug into the bung-hole is thus inserted without loss of wine; but this process is open to a serious objection, namely, the agitation under the blows on the faucet and by the indropping plug of the contents of the cask, and the consequent stirring up of sediment. The object of this invention is to overcome these difficulties by providing a valve for the bung-hole, which remains normally closed under the pressure of the liquid, and which may be readily opened by the insertion of the faucet.

CLINCHING-PUNCH.—John R. Watson, Sacramento. No. 337,036. Dated March 2, 1886. This punch consists of two handled and pivoted jaws, a die in one jaw having a beveled or V-shaped point, an adjustable socket-head in the other, and a peculiar locking-plate for holding said bed rigid to resist the material under the thrust of the die, and for releasing the bed to allow it to move out of the way of the clinching surfaces or faces of the jaws. This tool is intended to punch and clutch at the same operation. Though the tool may be used for many purposes, the inventor's special object is to apply it to the sealing of railway cars. It is customary, when the car is about to leave a station, to pass a strip of tin through the lock-staple, and, after winding it around until its ends overlap, to punch the two layers or double thickness, with an ordinary punch, which has then to be removed and turned around to the reverse side of the tin strip, and again operated to clinch the small tongues or burrs made by the pinching die. This is known as sealing and its object is apparent. By the aid of this tool the punching and clinching can be done at a single operation, and thus save time and labor.

MACHINE FOR DRYING VARNISHED LABELS.—Carl Rahsskopf, S. F., assignor to Schmidt Label and Lithographic Co. No. 355,771. Dated Feb. 9, 1886. This patent covers a new machine, the object of which is to dry wet or newly-varnished prints, labels, etc., and it consists of an endless serpentine carrier, consisting of side chains and parallel spaced transverse bars adapted to receive and carry labels, etc.; power-transmitting mechanism for driving the carrier; a clutch mechanism operated and controlled by the varnishing press for regulating and controlling the periodical movement of the carrier; a novel arrangement of swinging flaps for feeding the labels; an endless transverse belt located between the flaps and adapted to receive the labels and deliver them to the carrier; and a mechanism operated and controlled by the press for periodically moving the belt. Labels are put through the varnishing press rapidly and are too wet to handle immediately after being varnished, and much time is wasted by attempting to take them by hand and remove them to any drying apparatus; but by means of this new machine the labels are not touched by the operator, but are carried by the mechanism of the varnishing press through intermediate devices to the carrier, and are moved along it for a length of time equal to the carrier, so that when they come out at the other end they are comparatively dry and can be easily handled.

MECHANICAL PROGRESS.

Malleable Castings.

The average apprentice, also the average journeyman iron-worker are led to believe that to make cast iron malleable requires only to encase the same in a metal box, to heat the same for a number of hours, and to let it cool gradually. Such is, however, erroneous. Malleable castings, in the shop phrase, are termed "malleable iron," which is also wrong. The proper term is malleable cast-iron.

To make malleable cast iron the following formula must be resorted to: First the irons are usually cast of red hematite pig from the cupola furnace the same as any ordinary casting. After removing them from the sand, they are separated and placed in the rumblor, a cylinder of heavy sheet-iron fastened to a shaft. In the rumblor is also placed sharp, gritty sand, gravel and pieces of broken iron. The door or lid is then closed or fastened, the belt then put on to the pulley on the end of the rumblor-shaft, which sets the rumblor in motion. The object of this operation is to remove the sand and oxide or scale on the castings, and to cut down the rough places on them. In due time the irons are removed from this rumblor, and are quite bright and have the appearance of having been roughly polished.

The next process is the preparation of the chemicals which, with the aid of heat, are to make the surface of the castings malleable. These chemicals are steel oxide, or the scales which fall from steel in its manufacture or when it passes through the rolls, the same in appearance as the scales which fall from iron when being forged on the anvil. With the steel oxide is mixed a proper quantity of sal ammoniac, which has the effect of making the oxide stronger. The oxide takes up the sal ammoniac as each has an affinity for the other.

The next process is to place a layer of the compound in a cast iron box; then the castings are placed in layers, each layer being covered with the compound and the box well shaken to cause all the interstices or spaces between the irons to become filled. When the box is thus nearly filled a heavy or thick layer of the compound is placed on the top of the last layer of castings. The lid is next put on and secured very firmly. Then all the joints formed by the box and lid are thickly luted or pasted with fine clay or mortar, which is to make the box absolutely air-tight.

When all is in readiness, the boxes are placed in a large brick furnace lined with fire-brick or fire-tiles. A fire is then made, usually from anthracite—hard coal—and kept at a continuous glow for four, five or six days, according to the size and shape of the irons being treated. While the cast-iron is in a state of red heat it takes up the oxide, or such parts of it as it has an affinity for, on its outer surface, and, being free from the action of air, cannot throw off any of its own oxide and become smaller than when placed in the box. In due season the fire is allowed to cool down, the boxes are removed from the furnace, and when cool enough not to be affected by the atmosphere the castings are removed and are then the malleable castings of commerce, the malleable skin varying from 1/64 to 3/32 of an inch, which allows of their being malleated or worked to a certain extent whether cold or hot. By care and a little practice malleable castings can be welded together onto iron or steel, the process being the same as welding cast-steel or spring-steel. It is almost next to an impossibility to make malleable castings strictly uniform. The gradual heating and cooling of cast-iron would only rot it, and would not make it malleable. — *Carriage Monthly*.

Titanic Steel.

A recent number of the *Mechanical World*, London, says that a new process for the production of titanic steel has been in full operation for about nine months at New Islington, Manchester. There are several patents involved in the method of manufacture of this commodity, all owned by the two partners of the firm, Messrs. Bott and Hackney. The castings obtained from this new metal have recently risen very greatly in the estimation of the engineering firms in Lancashire, as well as others at a remote distance, and we are not surprised at this, as the properties of the metal are truly remarkable. In a recent visit to Messrs. Bott and Hackney's works numerous castings were seen of all manner of shapes and thicknesses, and we were agreeably surprised and pleased at their excellence and faultless character; the castings are made in the ordinary green sand, and the surfaces are quite free from holes, flaws or other bad places. The cast metal can be readily forged and hardened or annealed just like a piece of tool steel; for example, we saw a part of a broken wheel with a bit of rim sticking on forged out to a taper form, and then, after heating to red heat, suddenly plunged into cold water, without showing the least signs of distress or fracture; after this severe treatment a piece was broken off, the fracture showing an exceedingly fine grain. It will be seen at once that a metal which will allow of such treatment is admirably adapted for use for parts subject to great shock, such as wheels. One engine-builder in Manchester is adopting this metal for the working parts of his small high-speed engines, as well as for some of the parts

of large engines such as the piston rod and cross-head; in some instances these have been made in one casting. For chain work this special steel is to be commended both on account of its great strength and toughness. Mr. Bott has a special form of link chain for elevator purposes, which, by an ingenious arrangement does away with the rivet connecting the separate links. The connection is made by means of a round bar having a projection on one side which will only allow of insertion or withdrawal when the links are in a certain position. When the pitch of links on one side is much worn, this chain can be reversed, its life being thus greatly prolonged. Elevator buckets made from titanic steel are exceedingly tough, it being impossible to break them by ordinary usage; these buckets are only about one eighth inch thick. Hammer heads and horseshoes are among the numerous productions for which this steel is specially adapted, and for which purposes it is coming into much more general use. The above is a brief description of some of the properties of the new steel; shortly we hope to give an account of the manufacture.

A HIGH-SPEED ENGINE.—During the last year or two, says an English paper, it has come to be generally understood that large machines driven at a comparatively low speed are the best for electric lighting purposes, but the lighting at Lincoln's Inn Dining Hall and Library must be considered as an exception to the rule. The dynamo there is driven at no less than 12,000 revolutions a minute by a Parsons high-speed engine, which justifies its title by running at the same rate. It requires some mental effort to take a statement of this kind seriously, yet there is no reason to regard the Parsons motor as a toy. It was shown in action at the Inventions Exhibition, running with unimpaired steadiness from the beginning to the close of the show. It is in reality a combination of turbines driven by steam, and consists of two series of parallel-flow turbines to the right and left of a central steam inlet, the steam exhausting directly from the first turbine into the second, from the second into the third, and so on through 20 turbines in each series. The steam parts with a portion of its energy in each turbine, and finally escapes at a pressure not much above that of the atmosphere.

RUSSIAN SHEET IRON.—The following method of manufacturing Russian sheet iron is given in "Calvert's Almanac." Selected iron is hammered into slabs of the right size, and to make a finished sheet the slab is passed through rolls, making 75 to 80 revolutions, three or four times, after which it is hammered again. Several sheets were then heated to a full red heat, covered with charcoal shaken on to them from a bag made of coarse linen, and are then piled with covering sheets of heavier iron top and bottom. The piles are then worked down under a heavy hammer until nearly of the finished size. When cool the hammering ceases, the plates are separated, reheated, and piled again with cold plates interposed, the hot and cold sheets alternating in the pile. The hammering is then repeated until they are cool, after which they are cut to size.

WIRE BELTS FOR CUTTING STONE.—The principle of continuous motion, as in the belt saw for wood, is fast working its way into general use in Europe for stone cutting. We have already alluded to this new method. A late number of *London Engineering*, after alluding to its successful use, says: "Instead of a flat metal band, three steel wires, twisted together and run at a very high speed, form the cutting surface. Water and sand are applied in the usual manner with the ordinary flat saws for stone. It is claimed that such saws advance in marble from 10 inches to 24 inches an hour, according to the hardness of the stone. It is also used for quarrying purposes, in dividing up masses of stone projecting between recesses in the quarry."

PERFECT COMBUSTION OF NATURAL GAS IN FURNACES.—E. J. Dashbach, of Pittsburg, Pa., has invented a new apparatus for the aforesaid purposes. It is the application of the Argand burner principle to the new fuel. It has been introduced at the mills of Jones & Laughlins, and at the Linden Steel Works, where, it is claimed, the heaters are enabled by its use to make their heats in one-third of the time formerly required, that is, in one hour instead of three hours. The new process is said to be a great economizer of natural gas, enabling the furnaces to run on two ounces of pressure, and as the combustion takes place in the furnace the stacks are not burned. — *American Manufacturer*.

AN EXCELLENT CEMENT.—A good authority says that a first-class cement with which to fasten stone to stone, or iron to iron, is made by mixing a paste of pure oxide of lead, litharge and glycerine. This mixture hardens rapidly, is insoluble in acids and is not affected by heat. It has been used to fasten the different portions of a fly wheel with success, while, placed between stones and once hardened, it is easier to break the stone than the joint.

No two locomotives will ever work just alike. Though built exactly after the same model they will have different rates of speed and drawing power. This difference in speed has been known to reach 15 miles an hour,

SCIENTIFIC PROGRESS.

Artificial and Natural Moisture.

There is a wide difference between the effect of natural and artificial moisture in the atmosphere of a room. This is particularly observable in a cotton factory, where a certain degree of moisture is required in order that the fiber may be properly manipulated. Dry winds greatly interfere with such work, especially when they are continuous for several days. Natural advantages are generally utilized in locating mills to secure moisture, such as so placing them in valleys which open toward the direction of moist winds, locating them upon clayey, damp ground, etc. In some instances large shallow reservoirs of water are placed upon the mill-roof or in its near vicinity, so that the natural evaporation from the same may be taken advantage of.

Naturally, attempts have been made to moisten the air of mills by allowing the escape of steam into the rooms, or by arranging for the dripping of water in some part of the room, but all such artificial means for creating moisture are found to be quite defective; the moisture does not have the effect upon the fiber which is observed from natural moisture. One cause of the difference, no doubt, arises from its irregular quantity when so produced, but there are evidently some peculiar conditions connected with the particles of natural moisture which do not exist in those which are artificially produced. Moreover, artificial moisture added to the atmosphere causes the machinery to rust much more extensively and is productive of colds among the operatives to a much greater extent than natural moisture. Curiously enough, the difference does not seem to be as marked in this country as in England.

Experience has fully proven that there is a certain condition of the atmosphere which is more favorable to the working of cotton than any other, and any variation, be it even very slight, is noticeable in the work. The proper degree of moisture is usually regulated in American mills by means of a reliable hygrometer.

Thick brick walls are found to be excellent distributors of moisture. The walls absorb moisture from the air, both within and without, and give up a portion of it when the air becomes too dry. A very curious fact in this connection is that the walls affect different stories in the mill very differently.

The quantity of water absorbed by the atmosphere is much larger than is ordinarily supposed. Let us consider what might happen in a work room on a cool day in early spring. We copy from a paper read before a late meeting of the Lowell Overseers' and Artisans' Association: The morning would be likely to be cold, the room would be warmed artificially until its temperature reached about 70°, and in order to moisten the air, steam might be blown into the room. The presence of any water in the vapor in the air could not, by the ordinary sensations of the work people, be perceived until the air had become nearly or quite saturated. Let us suppose that the steam had been let in so slowly that the air did not get nearly saturated until 2 P. M., when, on account of the warming of the room by the sun, the temperature has risen to 73°, when the supply of artificial heat is shut off. Let us suppose our room contains 300,000 cubic feet, and that when the artificial heat was shut off that the relative humidity had risen to 90°. If such had been the case there would have been $1.27 \times .90 \times 300 = 342.9$ pounds of water vapor in the room, or 42.8 gallons of liquid water if it were condensed. The air soon begins to grow colder outside, and there is a flow of heat set up from the inside of the room to the outside air, through windows, walls and doors. The steam continues to enter the room, tending to keep up its temperature, but the heat escapes more and more readily as it grows colder outside, and finally the temperature begins to fall within the room, and very soon falls to or below the dew point. The effect of any further outward flow of heat will be a condensation of water within the room, the latent heat of the condensed vapor being given up to make up for the outward drain of heat. This condensed water will collect upon the objects within the room until it can be noticed that they become moist, when perhaps the inflow of steam will be stopped. The temperature of the room, although falling, has not reached an uncomfortably low point, since a moist air is not uncomfortable until it is several degrees colder than is the lowest comfortable temperature of a dry air.

It is pretty near shutting down time also, the overseer and everybody else are getting ready to go home and do not think of what is going on in regard to the humidity of the air. The heat, however, is flowing out faster and faster, the temperature falling and the water vapor condensing all over the room. Suppose that the temperature has fallen to 60°, let us see what has happened. There will now be only .82x300 or 246 pounds of water vapor in the room. In other words 342.9—246=96.9 pounds of water vapor have condensed into 12 gallons of liquid water and settled upon the clothing of the work people, the machinery and other objects in the room, and in the cotton. Add to this the unknown amount which was condensed before it was noticed that condensation had begun, and we can readily believe that, under such circumstances, it would be found, as it was found in England, that moist-

ure artificially added to the air, causes the machinery to rust, the operatives to have the rheumatism, and, curiously enough does not have the same effect upon the cotton that natural moisture does!

The writer seemed to be under the impression that all this trouble might have been prevented by shutting off the steam that was blowing into the room, at the proper time and maintaining a more nearly uniform temperature during the day. He further expresses the opinion that American experience does not show that artificially added moisture, when properly regulated, presents any perceptibly different effect from that which is natural. This opinion, however, differs from that of most observers.

THE CANT ABOUT "PURE SCIENCE."—It would seem from observations not unfrequently bazzarded by some very superior persons, whose happy mission it is to put the rest of the world to rights, that there is something derogatory to the man of science in making his science subservient in any way to the requirements of his fellows, and thereby contributory to his own means for the support of himself, and of those depending upon him. Now, on this not uncommon cant of the day, a little plain speaking would seem to be very much wanted. While the investigation of nature and the interpretation of natural law are admittedly among the highest, as they are among the most delightful of human occupations, the right application of natural law to effect desirable objects is in itself a scarcely less worthy occupation; many of these objects being of paramount importance, and attainable only by the exercise of high scientific sagacity. In this manner, as in so many others, this sense of proportion is but too often lost sight of. Because the investigations of a Newton, a Darwin, a Dalton, a Joule and a Faraday have an importance of which few among us can adequately conceive even the measurement; because among the scientific men now or but lately living in our midst are to be found those whose investigations in pure science have not only won for them a high renown, but have earned for them the gratitude, and should have obtained for them the substantial acknowledgments of their country and the world; and because even the minor investigations and discoveries that are ever being made in pure sciences have all of them their merit and their value, it does not follow that the mere accomplishment, it may be in an abundant leisure, of two or three minor investigations, however creditably conducted, are to lift their authors into a scientific position, altogether above that of men whose laborious lives have been spent in rendering their great scientific attainments directly serviceable to the needs of the State and of the community. — *Popular Science Monthly*.

INVESTIGATION INTO THE LAKE DWELLERS.—In his recent investigation of pile dwellings of the Lake of Bienns, Dr. Studer has met with two extreme types of human skulls—the brachycephalic and the dolichocephalic; the former (at Schaffis and Lusery) belonging to the pure stone period, and the latter (found at Vinelz and Sutz) to the bronze period. These facts point to an invasion by the bronze men, involving a complete transformation of the group of domestic animals; the horse appears for the first time, and new races of sheep and dogs drive out the old forms of the stone period. The occurrence of mesocephalic, and even much shortened, skulls of the bronze period shows that there was no extinction of the brachycephalic race, but that the two races mixed. This mixture of races in prehistoric times increases the difficulty of tracing back the skull forms of the present population. Dr. Studer suggests that the Rhaetian short headed type may be referred to the old dwellers of the stone period, in which case the prevalent dark hair, eyes, and skin, of the present natives of Graubünden may recall the aspect of the older prehistoric race. There is also a large dark population about the lakes in Canton Berne. — *Nature*.

ARSENICAL COMPOUNDS.—A small quantity of arsenic introduced into soap constitutes "arsenical soap." In dyeing works it is used to give brilliancy to the reds. Calico printers' soap is called "arsenical soap." In the dye works it is called "printers' soap." Arsenate of copper is a green color, used in paper-printing for wall papers, but it is injurious to health and is now but little used. Arsenate is a salt formed by arsenic acid combined with any base. Arsenic is a metal of a steel gray color and brilliant luster, though usually dull from tarnish. It is very brittle and sometimes native, but usually combined with silver, nickel, iron, antimony and sulphur; orpiment and realgar are two of its sulphur compounds. Orpiment is the true arsenicum of the ancients. There is arsenical vapor, and an ore of silver containing arsenic. Arsenic acid is composed of two equivalents of arsenic and five of oxygen. Orpiment is the trisulphide of arsenic occurring in crystals, of a lemon color and having a resinous taste.

THE SPECTROSCOPE.—By means of that remarkable instrument of modern research, the spectroscopic, the otherwise absolutely imperceptible motion of so-called fixed stars is not only detected, but measured. Sirius is found to be now approaching the earth at the rate of 20 miles a second, while a few years ago this notable star was receding from us 25 miles each second.

Passing Events.

First-class fares to New York from this city by rail reached the low price of \$25 one day this week. The trains both going and coming are very large and crowded. Those leaving are going on visits, and many of those coming are here to stay. Nothing has happened for many years so conducive to the interests of this State as the prevailing low rates. A very desirable class of people is coming here to settle. Moreover the tourist travel is to our advantage in many ways. The freight rates are low, too, allowing us to ship large quantities of home products to good advantage.

A feature of note in the mining situation of the day is the large amount of chloriding and tribute work going on in many of our districts. This system is beneficial to both mine-owners and miners, provided care is taken that the work is properly conducted. The plan is adopted in many new regions of late.

The reports of gold fields in the Sierra Madre mountains of Mexico, will scarcely attract many miners, as long as the Indians remain in that region.

The storm of the past week has added still further to the already good supply of snow on the mountains, so there will be plenty of water this spring and summer.

Reducing the Cost and Risk of Quartz Mining.

As a general thing it has been the practice of Californians owning or operating mines to begin at the beginning: that is, they have usually taken what are denominated mere prospects and developed them into productive, and as experience shows, almost always into paying properties. It has not been the custom, even with our home capitalists when making investments in mines to buy those already opened up and equipped with plant. This policy of taking many risks in a small way instead of large ventures on a seeming certainty, has in practice proved a wise one. It is the natural method, the course pursued by all practical men in founding a business. The merchant goes to work, and by careful management, creates his trade. The lawyer and the doctor laboring assiduously year by year, establishes each for himself a practice. The farmer clears and otherwise improves his tract of wild land, and little by little, converts it into a productive farm. These men may buy a horse to ride, a house to live in, or the implements necessary for the prosecution of their respective callings, but rarely ever do they buy or think of buying a business built up and furnished to their hand by another.

Adhering to the above plan our people have generally been fortunate in their mining ventures, and this for the reason that they have expended their money gradually, and only as there seemed to be warrant for the same. Being thoroughly acquainted with the character of the properties they were improving, they have been able to make these improvements to better advantage than could have been done by parties acting without this special knowledge. Then, too, these owners, being advised as to the weak and the strong points of such properties, have known when to sell and when to hold on, a knowledge that has not infrequently saved them from committing mistakes in this particular.

Pursuing a different policy the foreigner has not, as a general rule, fared as well in his mining ventures as has the home investor. Determined to accept none but a fully developed, outfitted and dividend paying property the former has been obliged to pay round prices for the same; the vendor consenting to sell only because he is getting what he believes to be its full value or because maybe he has detected in it somewhere a lurking infirmity, which latter is sure in good time to reveal itself to the consternation of the trusting investor.

Cases arise, it is true, in which mines already exploited and equipped with plant, and which may even be yielding large net revenues can be bought at a bargain. But these are exceptional, as any man possessed of ordinary business sense must know. The Californians are a generous people but their benefactions have not as yet run in the direction of selling productive gold mines for much less than their apparent value. If they do this they are apt to have a good reason for it. Hence it has happened that most of the losses incurred by outside investors have come through the purchase of just this class of properties. There is not a county nor a notable mining district in the State but furnishes evidence of this truth. The mines themselves are not dead nor have they in more than a few cases been depleted to a ruinous extent. The cause of failure was not that the properties were worthless, but that the purchasers paid a great deal too much for them—paid not only for the mines, but for the extravagant hopes and greed of the vendors.

Taught by experience, foreign investors, with out avoiding California, are beginning to adopt the plan which from the first has obtained among our own mining men—the plan of making their mines instead of buying them already made. Their agents, of whom there are many here, are looking about for good prospects, promising quartz lodes on which little or no expenditure has been made, and which for that reason they are able to get hold of at small cost, often on almost any terms they may choose to propose. There are in this State thousands of quartz claims located by prospectors, practical miners and speculators, who hold them simply with a view to disposing of them to others, the extremely liberal provisions of our mining laws making it possible for these locators to keep good their possessory titles from year to year. Affording no income and being in their present condition of little value to their owners, these

claims can be bought outright for very little money, or a controlling interest can be obtained in them in consideration of a certain amount of work being done upon them, ample time being given for prospecting them before final terms are concluded. While these claims are so profitless to the owners, the most of them possess more or less prospective value, the miner being too good a judge of quartz to waste his small means or expend much of his well-preserved energies on anything obviously worthless. In a majority of cases they offer some and generally sufficient inducement for even the most prudent to spend upon them money enough to determine their probable value, as this can be effected generally in a very short time and for a moderate sum.

Now, these California prospects, so multitudinous in number and so little explored, open, it seems to us, a wide and inviting field for mining enterprise and investment. The conditions under which they present themselves are everywhere good—so good that it would be useless to seek elsewhere for better. This risks to be incurred are here reduced to a minimum. The adventurer begins on something tangible and fairly promising and goes on as long as he thinks the prospect will justify, when he is at liberty to quit. Having expended a little money, he may stop when he likes. In no event need he take any desperate chances, going on spending his money blindly or plunging into debt. In the conduct of a business like this nobody need be financially ruined or even much hurt, while the outcome might, and very likely would be, the creation of several valuable properties for a moiety of the money one of these largely productive and elaborately outfitted mines would cost.

During the past few years, since the partial cessation of hydraulic operations has caused increased attention to be paid to quartz, this process of transforming these embryotic mines into lullion producers has been going on in a very marked manner. All over the State this work of evolution has been in progress, conspicuously so in Shasta, Nevada and Sierra counties, where scores of prospects have in this short time been converted into veritable bonanzas. In Shasta there are to-day several mines valued at more than a quarter of a million dollars each, that two years ago had never been heard of, for the reason that they had then neither an existence nor a name. The Young America, which with one small mill is now netting its owners \$20,000 per month, was then spoken of as a quartz claim situate somewhere along the rocky slopes of the Sierra Butte, not ten miners in the district having ever felt enough interest in it to inquire or care where it was located. Eighteen months ago, the Delhi mine, down on the San Juan Ridge, near North Columbia Hill, Nevada county, was a nonentity. Since then it has been literally created, and with an eight-stamp mill has brought the owners such revenue that they talk of half a million as about the proper selling figure for the property. And now come the experts and asseverate that they would just as soon take the chances of developing a pay chimney in any one of the dozen ledges near by, as they would in the ledge of the Delhi Company, from all which it may be inferred that there are great possibilities in that neighborhood.

And so we might go on and cite many other examples tending to establish the wisdom of taking up and utilizing these prospects, here so numerous, so easily gotten hold of, and so many of which have already enriched those who had the sagacity to turn them to practical account. We do not speak of these claims as mines, but only as the ready means for making mines. We present them as part of California's great store of opportunities.

The State Mining Bureau is now open at its new quarters in the Pioneer building on Fourth street near Market. The new rooms are large and well lighted. The Bureau occupies the top floor of the building, but an elevator runs between ten and five o'clock daily, rendering an inspection by visitors quite easy.

The discovery of rich placer diggings in the Magdalena mountains, in Sonora, will not cause the rush from along the border which would have followed had not the Apaches been roaming over the district. Geronimo is known to have a strong band with headquarters in the Sierra Madre.

Secular Variation of the Magnetic Declination.

By authority of the superintendent of the U. S. Coast and Geodetic Survey, President Davidson, at the last meeting of the Academy of Sciences, communicated an unpublished official report upon the "Secular Variation of the Magnetic Declination at San Francisco."

The data available for a rediscussion of this secular variation have lately been sufficiently increased to make a recomputation desirable. This has been done, and the result is such as to give us a satisfactory knowledge of the magnetic declination during the past one hundred years, as well as furnishing the needed predictions with safe data for the charts of this part of the Pacific Coast.

Some years since, Prof. Davidson, who had been annually observing the magnetic declination at the Presidio station, called attention to the fact that a maximum Eastern variation was close at hand. Moreover, he collated from manuscript voyages of Bodega and others, 1774 to 1790, over three hundred recorded magnetic variations on the Pacific Coast. *

With the accumulated material, Mr. Schott, the chief of the computing division, has found the epoch 1895 for the maximum Eastern magnetic declination, and the value thereof 16° 36'. This has been derived from the expression:

$$D = -13.81 + 2.79 \sin. (1.0 m - 134.7).$$

A full discussion was made of the variations noted by the above-mentioned Spanish navigators, and their work is pronounced admirable; the probable error of a single determination being ± 0.55 .

The isogonics for the Pacific Coast from Caps San Lucas to Vancouver Island for the epoch 1783 are given by the formula:

$$D = -10.3 - 0.381 \Delta \text{ Lat.} - 0.132 \Delta \text{ Long.}$$

cos Lat. - 0.0006 $\Delta \text{ Lat.}^2$, where D is the eastern magnetic declination for 1783.3, and

$$\Delta \text{ Lat.} = \text{Long.} - 31.9, \text{ or difference in latitude.}$$

$$\Delta \text{ Long.} = \text{Lat.} - 118.7, \text{ or difference in longitude.}$$

This formula will answer for the space within 250 miles of the coast. By means of this formula the first value obtained for San Francisco in 1783 was 12° 54' East, and for this epoch the secular variation formula gives 12° 47.5' East.

The great value of the observations by the Spanish navigators in this latter part of the last century is in the results enabling a formula to be deduced applicable to every part of the coast specified.

One advantage of this formula will be that if there be no local attraction at a given station a surveyor can compute the magnetic declination closer than he can observe it with the ordinary instruments at his disposal. At all events the computed declination is a severe check upon his observed declination.

Appendix No. 9, U. S. Coast and Geodetic Report for 1885.

THE coal miners and lumber men of Washington Territory are protesting vigorously against removing the duty from coal and wood. The protest says that if these articles be put on the free list every coal mine in Washington Territory will have to shut down; and that nearly every sawmill will have to stop. It says that Washington Territory cannot compete with British Columbia in either lumber or coal, as the forests and mines in that country are nearer the sea than those in Washington Territory. It states that the miners of British Columbia can sell coal 50 cents a ton cheaper than the miners of Washington Territory, on account of cheaper transportation. The petition concludes by predicting that 10,000 men in Washington Territory will be thrown out of employment if coal or lumber is placed on the free list.

THE CHINESE IN AMERICA.—As long ago as December 1879, Rev. O. C. Wheeler, D. D., LL. D. delivered an address on "The Chinese in America," treating it as a national question, and foreshadowing much that has since occurred in connection with this subject. The address, printed in pamphlet form reviews the whole Chinese question in an able manner, and the remedy suggested is "to check, to modify, to stop the immigration." Dr. Wheeler discussed the subject in a dispassionate manner, and his remarks were to the effect that if the Chinese were not prevented from coming here they would gradually undermine and control many of our profitable industries, as has since been seen to be the case.

Silver and Gold From Black Copper.

No. 2.

The accompanying engravings represent the solution vats and the launders, as indicated by the lines giving title to the respective cuts.

The solution vats are placed in a line; in front of them are slightly inclined launders lined with lead, which communicate with a series of others at right angles to these. The liquor flows over the bottom in a thin stream, and as the temperature is very much lowered by the exposure to the air of such a very large surface, the crystals of copper sulphate deposit on the bottom of the launders.

These launders are arranged in three double rows for every six solution tanks, the first one being 20 meters long and the two others only nine meters. Between each set of two troughs there is a doubly inclined table, covered with lead, on which the crystals as they form on the bottom are thrown to drain. The distance between the two troughs is two meters. The width of the aisle between each set of troughs is 1.50 meters. The total length of all the troughs is 106 meters, and they have 93 square meters of surface. At every angle a little dam is made to make the liquors fall over it and thus further to cool it. When the crystals have accumulated on the bottom sufficiently, they are detached with shovels and thrown up on the inclined tables to drain. After they have drained they are washed with water supplied by four tanks, three by two meters and one meter deep, placed on one side of the tables, in order to remove the acid mother liquors, and after they have again drained are collected in barrows to go to the solution vats. As no attempt is made to separate it, all the insoluble material which comes from the copper is taken up with the crystals as they form. These are cleaned up two or three times a day, the strength of the solution being kept as nearly uniform as possible. The spent liquors are run into a tank 2.40 meters square, from which they are again pumped up by an injector to be used again. The crystals which form nearest to the solution tanks are the richest in precious metals. Those which form at the end contain less silver and considerable gypsum. The fine material, which remains a long time in suspension, is composed mostly of compounds of arsenic, antimony, and lead. All of the crystals must be sorted according to their composition. This is done by keeping separate all

Variable Motion to Concentrators.

Adams and Carter, of this city, have obtained a patent through the MINING AND SCIENTIFIC PRESS Patent Agency for certain improvements in that class of concentrators like the Frue, in which is employed an endless traveling belt upon a frame or table to which a shaking or vibratory motion is imparted. The

so that a complete rotation of the driving or side shake shaft gives two rotations to the other. The cranks of both these shafts are "quartering," that is to say, their starting centers are removed by 90 degrees. This quartering of centers of the cranks, together with the proportional or relative sizes of the gears or pinions, results in imparting to the table a motion which may be correctly described as

SECTION OF SOLUTION LAUNDER.

improvements are such that, by reason of the variable and modified motions which are imparted to the machine, it is adapted for more general application than the ordinary concen-

trators to which a single movement is given. Different kinds of ore and other material may therefore, be treated in this new concentrator and be subjected to the more advantageous

SOLUTION LAUNDER.

ing as described, and changing the gear on the end shake shaft for one which has the same number of teeth as the gear on the side shake shaft, each point of the table is caused to move

through a perfect circle. Then by leaving the gears of the same size and working the cranks of the two shafts on the same center, they obtain a diagonal motion in a straight line at an angle of 45 degrees. Between these limits, by changing the relative centers of the cranks, modifications or variations may be obtained between the complete circle and the line at an angle of 45 degrees, and by changing the relative size of the gears the compound movement between the figure 8 and that of the circle may be modified and varied. There are several minor details of

construction carried by the new patent, which go to still further improve this class of concentrators.

Academy of Sciences.

At the last meeting of the California Academy of Sciences, Ex-Governor George C. Perkins was proposed for life membership, and Carlton H. Clark, Wm. Churchill, George A. Johnson, J. W. Anderson, Miss M. S. Haggin, were elected resident members.

The president, Professor Davidson, read a written report of his observations of the annular solar eclipse of the 5th inst.; also a paper on the secular variation of the magnetic declination at San Francisco, which is referred to elsewhere in these columns. A very interesting paper by Lieut. John C. Cantwell, on the exploration of Kowack near Alaska, was read. Lieutenant Cantwell is attached to the United States revenue steamer Corwin, and the exploration, which extended to the lakes which form the source of the river, was made in July, 1885. The exploring party left the Corwin in the inlet into which the Kowack empties, and proceeded up the river with a steam launch and a skin boat—the latter being laden with supplies, instruments, etc., for the expedition. After encountering and overcoming obstacles and perils innumerable, Lieutenant Cantwell and a portion of the party, accompanied by Indians, who had been invaluable assistants, left the launch in charge of Mr. Townsend and another, at a point higher up the river than the farthest point reached by Lieutenant Stoney in the preceding year. They then continued their perilous journey with the skin boat, poling, dragging and lifting it over shoals, rapids and cataracts, until their eyes were gladdened by the sight of the clear blue water of the lakes which form the sources of the river. They had made an ascent of 500 miles in twelve days. The current of the river was very rapid—eight to ten knots—and it was with extreme difficulty that the trip was made. The mountains near by were covered with dense timber. The banks of the river in some places were composed of ice 15 feet thick. The party were annoyed by frequent very heavy rains, and also by clouds of mosquitoes. When the rain stopped, the thermometer went up to 94 and 96 degrees, a temperature few people would expect to find in Alaska, but common in the region described, in the summer. Lieut. Cantwell described his explorations in a very interesting and graphic manner.

Mining Accidents.

James Hocking lost his life at the Hyde mine, Tuolumne county, last week. The unfortunate man and his uncle, Thomas May, were working at the bottom of an incline when a boulder weighing about a ton became detached from near the mouth of the incline. The huge boulder in its deadly descent was not heard by the men working at the bottom of the incline, and no attempt was made by them to avoid it. James Hocking who had the misfortune of being the victim of this life-taking boulder, was struck on the head and instantly killed. Thomas May, though working but a few feet from his companion, miraculously escaped injury.

Lars Anderson, the miner who was caught by a cave in his mining claim on Weaver creek Trinity county, last week, has since died.

Captain Henry Trewella, a well known Comstock miner, was severely injured on Saturday last. He and some other miners were working on tribute work in the Hale and Norcross mine. Trewella was loading a drill hole in the face of the drill, using a wooden stamping rod when, from some unexplained cause, the charge exploded, the powder not being yet covered by any tamping material. The hole being about on a level with his head, the full force of the powder explosion took effect on the left side of his breast, shoulder and face, knocking him senseless for the time. His breast and face are badly burned, and the left eye completely destroyed, the left side of his head being also much lacerated by pieces of rock. His right hand is also terribly lacerated from the stamping rod, but fortunately no bones are broken, although the thumb was nearly torn off. Being nearly or quite sixty years old, nothing but a naturally strong constitution and skillful treatment can bring him out alive.

The French Government is at work on amendments to its mining laws.

those taken from the different parts of the launders. In this way the residues are classified at once into rich or poor, pure or impure.

A GREAT many Chinese are flocking to the mines in the vicinity of Folsom: the old mining tailings worked over 30 years ago by the whites are being washed over again by the Chinese.

CERNUSCHI, the champion of bimetalism, says that monetary science has nothing to do with the strikes at the East.

motions for the end in view.

One of the shafts is arranged to give the side shake to the machine, and another shaft gives the end shake, by the aid of suitable mechanism. By the aid of suitable gears and cranks, the combination of these two movements acting simultaneously, enables the inventors, by variations of the crank centers and in the relative sizes of the gears, to produce variable and modified motions.

The gear or pinion on the end shake shaft is one half as large as that on the side shake shaft,

through a perfect circle. Then by leaving the gears of the same size and working the cranks of the two shafts on the same center, they obtain a diagonal motion in a straight line at an angle of 45 degrees. Between these limits, by changing the relative centers of the cranks, modifications or variations may be obtained between the complete circle and the line at an angle of 45 degrees, and by changing the relative size of the gears the compound movement between the figure 8 and that of the circle may be modified and varied. There are several minor details of

PRACTICAL HYDRAULICS.*

PRINCIPLES OF HYDRAULICS.

[Written for MINING AND SCIENTIFIC PRESS by P. M. RANDALL.]

WITH RESPECT TO DISCHARGE.

One-half the square of side, $2.5 \times 2.5 \div 2 = 3.125$ square feet.

By Rule 51, $5.27 \times 3.125 = 16.47$ cubic feet.—*Ans.*

Or, by Rule 55, find, by Table 17, the discharge of a pipe 2.5 diameter, for the given fall, 25.87 cubic feet.

$25.87 \times .637 = 16.48$ cubic feet.—*Ans.*

Ex. 95.—The fall being 5.28 feet per mile, what will be the discharge of water flowing in a flume whose mean width is 8 feet, angle of side slope 45° , and coefficient of roughness, $n = .011$.

Cal.—By Table 17, for a fall of 5.28 feet per mile, and 8-foot pipe, the discharge per second is 350.5 cubic feet. Then by Rule 55,

$350.5 \times .586 = 205.39$ cubic feet.—*Ans.*

Remark.—With respect to the flow of water in pipes not differing largely in size, it may be assumed without material error in practice, that the velocities are proportionate to the respective diameters.

If greater accuracy be required, recourse to (133) will need be had.

Ex. 96.—The fall being 2.64 feet per mile, what is the discharge per second in a flume 9 feet wide, 4.5 feet deep, and the coefficient of roughness, $n = .011$?

Cal.—By Table 17, the velocities for a fall of 2.64 feet per mile, due pipes 8 and 10 feet diameter—mean $= \frac{8+10}{2} = 9$ feet—are 4.88, and 5.84 feet—mean $= \frac{4.88+5.84}{2} = 5.36$ feet, velocity per second.

Whence, $5.36 \times 9 \times 9 \div 2 = 217.08$ cubic feet.—*Ans.*
Kutter's Formula for the Flow of Water in Open Streams.

Among the most eminent experimentists in hydraulics, during the present half century, have been D'Arcy and Bazin, Humphreys and Abbot, and Kutter. Prior to this time, the science of hydraulics was largely speculative and incoherent. The older hydraulicians had determined on meager data certain laws which they erroneously held susceptible of general application.

D'Arcy and Bazin having collected a large amount of experimental data, deduced therefrom and published in 1835, a formula better adapted than any preceding for finding the flow of water in open streams and pipes of medium size. The report of Humphreys and Abbot on the "Physics and Hydraulics" of the Mississippi river, published in 1861, is very justly esteemed by engineers, first in importance, as to the extent, accuracy, and value of its contributions to experimental hydraulics. Their formulas, however, deduced from their experiments, besides being quite complex and tedious of application, give results too low for the flow of water in small and medium sized streams. Thus, between the formula of D'Arcy and Bazin, and those of Humphrey and Abbot, there existed a wide hiatus, till it was effectually closed up in 1870 by the introduction of Kutter's formula.

The mode in brief of Herr Kutter, in accomplishing this difficult and laborious task, is substantially as follows:

1st.—To divide the great mass of the observed and trustworthy results at his command, appertaining to the flow of water in open streams, into twelve classes, arranged as shown in Table 26, with reference to the degree of roughness of the stream-beds.

2d.—To adopt, on careful comparison of various formulas for the velocity of water under the imposed conditions, the following formula of Chezy as the basis:

$$v = c (r s)^{\frac{1}{2}}, \quad (251)$$

noting that c is variable.

3d.—For the determination of the values of c , that shall, when substituted with the given values of r , the hydraulic mean depth, and of s , the sine of slope in the Chezy formula (251), yield results respectively corresponding to those determined by observation, he makes extensive experiments with several trial formulas, among which is that of D'Arcy and Bazin, hitherto considered in our discussion of the flow of water in pipes.

Of these trial formulas, the following finally adopted is one devised by himself, which is not only

more simple in form than that of D'Arcy and Bazin, but yields results nearer in accord with those observed:

$$c = \frac{a'}{1 + \frac{b'}{r^{\frac{1}{2}}}} \quad (252)$$

This formula, however, is faulty, in that it is limited in application.

Thus by inversion, it is shown to be an equation to a straight line whose abscissa $= \frac{1}{r^{\frac{1}{2}}}$, whereas the plotted results of observation indicate a curve, and further show that a' is dependent upon the value of b' —in a word, that a' and b' are variables, and not constants, as at first assumed.

4th.—To generalize Eq. (252) the variable terms z for a' and x for b' are substituted in it; whence,

$$c = \frac{z}{1 + \frac{x}{r^{\frac{1}{2}}}} \quad (253)$$

5th.—"After much examination and further comparison," (Kutter's words) he puts,

$$z = a + \frac{l}{n}; \quad (254)$$

$$x = n z - l = a n. \quad (255)$$

Substituting these values of z and x in (253), we have

$$c = \frac{a + \frac{l}{n}}{1 + \frac{a n}{r^{\frac{1}{2}}}} \quad (256)$$

Equation (256) is found, however, not suited to the extremes of inclination of water surface, nor to the extreme limits of sectional area.

6th.—To meet these requirements, in other words, to render the formula applicable to all cases whatever, Kutter noting that "when $r = \infty$, c will $= z$, and the coefficients z will have their values represented by an hyperbolic curve," makes in Eq. (253),

$$z = A + \frac{m}{s}, \quad (257)$$

in which A denotes the semi-axis of an hyperbola, m the tangent of the inclination of its asymptotes with the axis of abscissa, and $\frac{1}{s}$ (s representing the sine of slope) the abscissa; whence,

$$z = a + \frac{l}{n} + \frac{m}{s}; \quad (258)$$

$$x = n z - l = \left\{ a + \frac{m}{s} \right\} n. \quad (259)$$

Substituting the values of z and x of Eqs. (258) and (259) in (253), there results the equation in its general form for the value of the coefficient c , viz:

$$c = \frac{a + \frac{l}{n} + \frac{m}{s}}{1 + \left\{ a + \frac{m}{s} \right\} \frac{n}{r^{\frac{1}{2}}}} \quad (260)$$

Substituting the value of c of Eq. (260) in (251), there results the general formula of Kutter for the velocity of water in open streams, viz:

$$v = \left\{ \frac{a + \frac{l}{n} + \frac{m}{s}}{1 + \left\{ a + \frac{m}{s} \right\} \frac{n}{r^{\frac{1}{2}}}} \right\} (r s)^{\frac{1}{2}}. \quad (261)$$

Combining (257) and (254),

$$A + \frac{m}{s} = a + \frac{l}{n}. \quad (262)$$

Making s infinite in Eq. (262),

$$A = a + \frac{l}{n}. \quad (263)$$

To determine the relation of c to n , in its simplest form, let

$$\frac{1}{r^{\frac{1}{2}}} = l, \quad (264)$$

in which $l = 1$, as found by trial.

Substituting this value of l , and of $\frac{1}{r^{\frac{1}{2}}}$ in Eq. (256), and reducing, we obtain the relation sought,

$$\frac{1}{c} = n, \quad (265)$$

which, as determined for the Mississippi river, is

$$n = \frac{1}{c} = .027. \quad (266)$$

The value of A in an hyperbola, coinciding with the curve formed by plotting observed results, is found to be:

$$A = 60. \quad (267)$$

Substituting the values of $A = 60$ of (267), $l = 1$ of (264), and $n = .027$ of (266) in (263), transposing and reducing,

$$a = A - \frac{n}{l} = 60 - 37 = 23. \quad (268)$$

To find the value of tangent m , let an extreme case be taken, in which the values, as determined from the plotted curve, are:

$$s = 0.00000363; \quad (269)$$

$$z = 487. \quad (270)$$

Substituting these values, together with that of $A = 60$ of (267) in (257), transposing and reducing,

$$m = (z - A)s = (487 - 60) \times 0.00000363 = 0.00155. \quad (271)$$

Substituting these constant values of $a = 23$ of (268), $l = 1$ of (264), and $m = 0.00155$ in (261), there results for metrical measures:

$$v = \left\{ \frac{23 + \frac{1}{n} + \frac{0.00155}{s}}{1 + \left(23 + \frac{0.00155}{s} \right) \frac{n}{r^{\frac{1}{2}}}} \right\} (r s)^{\frac{1}{2}}. \quad (272)$$

To reduce metrical measures employed in Eq. (272) to those of a different system, let e denote the ratio of the former to the latter, noting that n and s , representing ratios, are not affected by the reduction.

$$\text{Substitute } z = 23 + \frac{1}{n} + \frac{0.00155}{s}; \quad (273)$$

$$x = \left\{ 23 + \frac{0.00155}{s} \right\} n; \quad (274)$$

$$v = \left\{ \frac{z}{1 + \frac{x}{r^{\frac{1}{2}}}} \right\} (r s)^{\frac{1}{2}} = \left\{ \frac{r^{\frac{1}{2}} z}{r^{\frac{1}{2}} + x} \right\} (r s)^{\frac{1}{2}}. \quad (275)$$

Let z' , x' , r' and v' represent respectively the terms to which z , x , r and v , of the metrical system are to be reduced, then will $z = \frac{z'}{e}$, $x = \frac{x'}{e}$, $r = \frac{r'}{e}$ and $v = \frac{v'}{e}$.

Substituting these values of z , x , r and v in (275)

$$\frac{v'}{e} = \frac{r'^{\frac{1}{2}} z'}{e^{\frac{1}{2}} + \frac{x'}{e}} \left\{ \frac{e^{\frac{1}{2}}}{e^{\frac{1}{2}} + \frac{x'}{e}} \right\} \left(\frac{r'}{e} s \right)^{\frac{1}{2}}. \quad (276)$$

Multiplying in (276), both numerator and denominator within the parenthesis by $e^{\frac{1}{2}}$; also, multiplying both sides of the equation by e ,

$$v' = v e = r'^{\frac{1}{2}} \left\{ \frac{z'}{e^{\frac{1}{2}} + \frac{x'}{e}} \right\} r'^{\frac{1}{2}} s^{\frac{1}{2}} = \left\{ \frac{z'}{1 + \frac{x'}{e^{\frac{1}{2}} r'^{\frac{1}{2}}}} \right\} (r' s)^{\frac{1}{2}}. \quad (277)$$

Substituting the values of $\frac{z'}{e^{\frac{1}{2}}} = e^{\frac{1}{2}} z$, and $\frac{x'}{e^{\frac{1}{2}}} = e^{\frac{1}{2}} x$, in (277).

$$v' = \left\{ \frac{1 + \frac{e^{\frac{1}{2}} z}{e^{\frac{1}{2}}}}{1 + \frac{e^{\frac{1}{2}} x}{e^{\frac{1}{2}} r'^{\frac{1}{2}}}} \right\} (r' s)^{\frac{1}{2}}. \quad (278)$$

With respect to the Kutter formula, equation (278) is general for the reduction of the measures employed in it to those of another system. An inspection shows that by multiplying z and x , by $e^{\frac{1}{2}}$ (the square root of the ratio of the different measures), each term of the equation [1 (unit) being common,] will be the denomination sought.

To render the equation in terms of English feet, Let $e = 3.281$, the number of feet in a meter. (279)

Substituting the value of $e^{\frac{1}{2}} = 1.811$ in (278) after restoring the values of z and x of (273) and (274), and omitting the accents with respect to v' and r' ,

$$v = \left\{ \frac{41.6 + \frac{1.811}{n} + \frac{0.00281}{s}}{1 + \left\{ 41.6 + \frac{0.00281}{s} \right\} \frac{n}{r^{\frac{1}{2}}}} \right\} (r s)^{\frac{1}{2}}. \quad (280)$$

Equation (280) for the purposes of application may be somewhat simplified in the following manner.

Putting the numerator inclosed in brackets under the following form:

Wholesale Charity Cheap!

EDITORS PRESS:—It is not always possible to be charitable without drawing on one's purse. I wish to point out to your readers a method of exercising their charity, which shall leave them not only happier in spirit, but shall tend ultimately to increase their store of this world's goods.

At a vast expense we endow hospitals, build orphan asylums, and establish refuges of various kinds, that our maimed and sick may be cured, our bereaved cared for, our incapables housed. Would that all these institutions were more capacious and more efficient! Would that the need for them were less!

But although we are thus charitable and tender to the unfortunate in our midst, while regarding them as individuals, we permit an institution for the wholesale manufacture of widows and orphans, of maimed and incurables. No human being can give one valid reason for the maintenance of this institution. No human being can point to any desirable end achieved by it, that could not have been more easily and better achieved without it. All affect to deplore its continuance among nations professing to be civilized, if not Christian.

The institution to which I refer is war. All our established charities are merely a futile attempt to eave at the spigot while war is waiting at the bung-hole. With incredible exertion and much parade a hospital is opened capable of receiving some hundred or two of patients; next week war breaks out and there are cases of mutilation in thousands, made gratuitously, wantonly, and unnecessarily. Surely if to bind up one man's wounds he charity, to assist in keeping 100,000 from wounds is much greater charity!

Public opinion can do this! American public opinion can do this! An individual can be deterred from flying at each other's throats, so nations can be deterred from mutual destruction. How, do you ask? Simply by law. An international Congress can be convened, backed by an international executive, competent to arbitrate all international disputes. Our society, the International Arbitration and Peace Federation is working for this end, and we want the help of every man and woman on this coast. Each has a share in the formation of public opinion and we want each to use their share, and to use it to its full extent. The president of our Federation is Rev. C. C. Stratton, president of the University of the Pacific, vice-president, Homer B. Sprague, president Mills' college and seminary. President Edward S. Holden of the University of California, also is a member of the Federation, so we have just ground to hope that young California will altogether be with us.

Ex-president Gen. R. B. Hayes also sends us his kindly greetings. He writes: "I am sure the march of events is with the cause of Peace, and of union between peoples."

I shall be glad to add to our list of members the names of all willing to assist this cheap and wholesale method of being charitable. We levy no assessments in cash, though any who want to help with cash can forward it to David Jacks, Esq., of Monterey, who has kindly consented to act as treasurer. What we want is a huge and irresistible contribution of public opinion. It needs quite a solid front of that to stand up against the vested interest of "blood and iron."

"Wut did God make us raytional creatures for, But Glory and Gunpowder, Thunder and Blood?"

EDWARD BERWICK.

Hon. Sec. I. A. and P. Federation.

Carmel Valley, Monterey, Cal.

EASTERN FISH COMING.—Professor Baird of the Fish Commission said he would send a carload of young fish to California to be placed in the waters there if the transportation could be arranged. Joseph Redding, whom Professor Baird has designated as agent of the commission in California, has raised \$1000 to pay the freight charges of the young fish to the Pacific Coast. The Commissioner has decided to send lobsters, which will probably be placed in the waters near Santa Barbara; eels, which will go to the sloughs in Sonoma, and fresh-water herring. Several deputies will take charge of the shipment and will see that the young fish are properly started in their career in the Pacific waters.

THE MOJAVE INDIANS at the Needles cremated the body of "Indian Charley" on last Saturday. Everything that belonged to the late lamented buck was also burned, except two horses, which the natives preferred to eat. It is the custom of the Mojave to burn everything and leave nothing for the widow and children.

THE STATE BOARD OF AGRICULTURE, at its recent meeting, passed a resolution inviting President Cleveland, through the Hon. Leland Stanford, in the name of the State Agricultural Society, to visit California, and to so arrange his trip as to be here during the annual State Fair of 1886.

THE first annual meeting of the California Museum Association was held at Sacramento last week. Total receipts for the year, \$7400; disbursements, \$5000. A collection is to be made during the coming year of all the imperishable products of the State.

USEFUL INFORMATION.

A WASHABLE WATER-PAIN.—Mr. Thomas Griffiths of London, the well-known inventor of the "Non-poisonous White," a substitute for white lead, which bears his name, is introducing to the trade a series of paints which can be made ready for use simply by the addition of cold water. The paint thus produced dries, it is stated, with a fine, hard surface, which, although mixed merely with water, is impervious to rain and uninjured by frequent washings, even with diluted disinfectants. As oil and turpentine are dispensed with, these paints are free from objectionable smell. They can be used for exterior work on wood as well as on brick, plaster, iron, or stone, and for interiors they are especially applicable to bedrooms, staircases, kitchens, etc. The paint can also be reduced by oil, which produces a hard, glossy surface. We should say that such non-poisonous and washable paints as these should find a ready sale in the colonies or in tropical countries generally, where cleanliness and freedom from infection are particularly requisite, but where the application of the ordinary oil-paints and distempers is neglected because of the elaborate processes and the skilled labor required. The convenient form in which Mr. Griffiths supplies the new paints, and the readiness with which a tin can be opened and closed, will prove important advantages in securing a market.—*London Iron.*

IMPROVED WATER-PROOF COVERING FOR ROOFS, ETC.—Wire gauze, preferably iron, is coated with a tough water-proof and elastic varnish or medium so as to cover the wire and close the meshes. The varnish or medium used is pure linseed oil, which has been previously oxidized and endowed with drying powers and thickened in a suitable manner. Wire-work so prepared is sufficiently transparent to admit light is waterproof and sun proof, comparatively inexpensive, and can easily be applied to the framework of a roofing or of windows, or used for such like purposes, and, as the improved material is not liable to be injured by unequal expansion or contraction between its component parts (a condition which does not exist in iron and glass roofs) it is especially applicable for roofing purposes. The material can be colored without affecting its transparency by the use of any of the well known transparent colors.

A CHINESE METHOD OF MAKING SHOVELS.—A Shanghai paper states that a novel branch of industry has recently sprung up at Chefoo. It is the manufacture of iron shovels. And we suppose our numerous readers could never guess what they are made of. They are made from old boiler tubes. Hundreds of men and boys are now engaged in this business. The old tubes are cut into short cylinders, just the length of the shovel, and then ripped open, flattened out and hammered into shape. Piles of these old boiler tubes may be seen everywhere in the back courts of the native Hong. Mule loads of these shovels are to be seen every day going into the country, and we learn that for one or two hundred miles in the country there is now scarcely a farmer that has not an iron shovel. The prices vary from 25 to 40 cents apiece, according to quality, thus bringing this useful implement within reach of all.

BEST PLANT FOR HOLDING BANKS.—The best plant at present known for consolidating, by the interlacing of its roots, the loose soil of a newly made embankment is, according to M. Cambier (of the French Railway Service), the double poppy. While the usual grasses and clovers need several months for the development of their comparatively feeble roots, the double poppy germinates in a few days, and in two weeks grows enough to give some protection to the slope, while at the end of three or four months the roots, which are ten or twelve inches long, are found to have interlaced so as to retain the earth far more firmly than those of any grass or grain. Though the plant is an annual, it sows itself after the first year, and with a little care the bank is always in good condition.

PARAFFINE AS A PRESERVATIVE FOR MARBLE.—Since the obelisk in Central Park, in New York City, was smeared with paraffine to prevent its disintegration from atmospheric changes the application of that substance to buildings of marble or stone as a preservative is becoming quite common. The latest example is the Exchange building, Broadway, which has been treated with acids over its entire front as a cleaning process. Mechanics are now going over the surface of every block, column, sill, and pediment with a sort of brazen blow pipe, from which three strong pencils of flame are projected against the marble for the purpose of heating it. This done, the paraffine is applied with a small brush. The buildings appear to be thoroughly renovated by this treatment.

HOT WATER BOILERS.—The cleaning out of kitchen boilers is seldom, if ever thought of. All sediment cocks should be left open at least once a week for the space of 15 minutes, so as to clean and wash out all foul sediment. Oftentimes when complaint is made that the water smells, or that it don't heat properly, the real cause will be found to arise from this neglect alone. In fact, people seem to go on

the plan that once in order, always in order. All plumbing fixtures require cleaning and looking after, just as much as the plate from which we eat.

THE NATURE OF COAL.—Some investigations made relative to the heat of combustion of stons coal have led to the conclusion by Meunier and others that during the formation of coal a certain quantity of heat must have been absorbed since the theoretical heat of combustion was always less than that actually observed. From want of knowledge, however, as to the real constitution of coal, it is regarded as impossible to determine the nature of this absorption. It is also a fact that, from want of knowledge as to the composition of coal, the heat of combustion cannot be calculated. It is well known that two coals of precisely the same chemical composition may and do afford very different degrees of heat in combustion.

SUNSHINE AND DRAUGHT IN CHIMNEYS.—The opinion is widely spread that the draught in chimneys is reduced by sunshine, and that the rays of the sun exert, as it were, a backward pressure on the smoke. Since Crooke's discovery of the mechanical work done by light, there seemed to be a chance of this view being correct, but after making a series of careful experiments, Hohlrausch has come to the conclusion that the rays of the sun do not press back the smoke. Probably the draught in chimneys is influenced by sunshine in the following way: The air around the chimney being heated, the difference of the temperature inside and outside the chimney, and consequently the draught is reduced.

RENOVATING GILT FRAMES.—This renovation applies to spots which have been formed, and for removal of which rubbing does not answer as being liable to loosen the gilt, or for general dullness. Apply with a camel-hair pencil a gum solution to which has been added gold brouze approaching the color of the frame. Before mixing with the gum water the brouze must be washed with water until it runs off perfectly clear. Repeat the application until the spots disappear. Then rub yellow wax slightly over a bristle brush and pass the latter softly with a dusting motion over the surface. Cover the frame until the wax has hardened to protect from dust.

THE MACHINERY OF GREAT BRITAIN.—It has been stated that "all the varied machinery of Great Britain, now operated by steam power, is capable of performing more work, and hence of creating more products, than could be produced by the labor of 400,000,000 able-bodied men, a greater number than all the able-bodied men on earth."

GOOD HEALTH.

Poison in Cheese.

It is well known that severe cases of poison have occurred from the eating of cheese. It has frequently happened in this country and cases have been known in Germany. It is a common expression among Americans who are effected by it that they have partaken of sick cheese. It is now well known that this effect is sometimes found in cheese of large dairies, although at one time, it was common to attribute it to cheese made on farms, in small quantities. The cheese made at a large factory in Ohio and Michigan convinced people that there were other causes than mere small makers, or inefficient ones for the existence of the poison. After long and patient investigation Prof. Vaughan of Michigan has given to the Board of Health of that State the valuable results of his investigations. Cats and dogs are not effected by it although they invariably choose the good cheese from the poor, when both are given to them to choose from. Possibly if a person tasted a cheese knowing that it was poisonous he might detect a sharpness of taste which would not ordinarily be noticed. But there is no certain means, aside from a chemical examination, by which a poisonous cheese can be distinguished from a wholesome one. The most trustworthy, ready method of examination is to press a slip of blue litmus paper against a freshly-cut surface of the cheese. If the paper is reddened instantly and intensely the cheese may be regarded with suspicion. When treated in this way any green cheese will reddens the litmus paper, but ordinarily the reddening will be produced slowly and will be slight. If the piece of cheese be dry it should be rubbed up with an equal volume of water, and the paper should be dipped in the water. Dr. Vaughan thinks that grocerymen should apply this test to every fresh cheese.

After a long and determined hunt the professor succeeded in isolating the poison, which will now pass into chemical science under the name of *tyrotoxin*. It is found to be a product of imperfect putrefaction in the cheese, and it occurs in the manufacturing vat, for the curd itself has been known to poison persons. Tyrotoxin appears in the form of needle-shaped crystals, which are freely soluble in water. The smallest visible fragments of a crystal placed upon the tongue caused a sharp, stinging pain and in a few minutes dryness and constriction of the throat. A slightly larger amount produced vomiting, nausea and diarrhoea. The isolated poison has a sharp pungent

odor, but in the cheese the taste and odor of the poison are both modified beyond recognition. The poison is volatile, and even poisonous cheese may be eaten after it is cooked.

The symptoms observed in cheese poisoning are similar to those caused by tyrotoxin, with the addition of head-ache, double vision, and marked nervous prostration. In rare instances the sufferer dies of colic.—*Hall's Journal of Health.*

Mortality and Occupations.

According to the *London Times* some interesting facts in connection with this subject appear in the supplement to the forty-fifth report of the registrar-general. It is shown that on the average the agriculturists have a comparative mortality figure of 644, the shop-keepers of 877, and the tailors, hatters, printers and book-binders of 1088. Living in a vitiated atmosphere seriously affects the respiratory organs. The mortality from diseases of these organs, and from phthisis, taken together, is 198 for the fishermen and 238 for the agriculturists, while for drapers and grocers 357, and for the tailors and printers 549. As drapers live in a more vitiated air than grocers, and printers than tailors, so the mortality in these several trades corresponds to the difference in each case. Arranging the various industries in the order of purity of air, the following are the averages of deaths from phthisis and diseases of the respiratory system: Fishermen, 198; agriculturists, 237; grocers, 283; drapers, 430; tailors, 471; printers, 627; chimney sweeps, 1519. The liability of chimney sweeps to malignant disease is about eight times as great as the average liability for all males.

Prof. Josef Korosi, the statistician, finds that the rich class average 52 years of life, the middle class averages 46 years one and one-tenth months of life, and the poor class averages 41 years seven months of life. From this it is obvious that the possession of wealth, and the resultant exemption from privation, lengthen the average life nearly ten years.

The *Popular Science News* asserts that the average length of life is constantly increasing, and the time may yet come when persons a hundred years old will excite no more curiosity than one of 80 years at the present time.

SCIATICA RELIEVED BY A SINGLE COCAINE INJECTION.—Dr. W. B. Menz, of Vidalia, La., writes that he was called to a lady, fifty-five years of age, who had been a constant sufferer from sciatica for ten years. The pain was very severe, and extended along the entire length of the nerve. She had run the whole gamut of anti-neuralgic remedies, and had never obtained anything more than very transitory relief. Having with him a vial of a four per cent solution of cocaine hydrochloric, Dr. Menz determined to try the efficacy of a subcutaneous injection. The hypodermic needle was inserted deeply over the sciatic foramen, and about twenty drops of the solution were passed into the tissues. The pain ceased almost immediately and during the six weeks that have since elapsed has not returned, although there has been no further treatment, and one injection only was practiced. The relief given by other remedies has never been of more than from two to four hours' duration.—*Medical Record.*

SCARLET FEVER.—After a room has been occupied by a scarlet fever patient all the articles, clothing, bedding, etc., that have been used about the patient, which can be washed, must be put into a tub with a disinfecting fluid. The following is good: Eight ounces of sulphate of zinc, one ounce of carbolic acid, and three gallons of water. Let them soak at least an hour, and then put them in boiling water for washing. Feather beds, pillows, mattresses, flannels and the carpet must be fumigated thoroughly. It is well to have the side walls and ceilings cleaned and whitewashed, and the wood-work and floors thoroughly scrubbed with soap and water. If the walls are papered, it should be taken off and the room repapered. It would be better to take up the carpet and carry away all useless things from the sick room at once, if possible. It is said by physicians that the infection can be conveyed by both books and papers, and it is certain that it can be carried by clothing.

DIABETICS.—Contrary to the general practice followed, Dr. Boucheron, in a note to the Academy of Sciences, advises diabetics to abstain from aluminoid food and alcohol, as well as from hydrocarbonized food. By this means, according to him, the sugar will disappear in three or four months. The brouimia and polydipsia are the first symptoms to give way, and strength will return with the general improvement.

THE OYSTER UNDER THE MICROSCOPE.—M. Cortes, the distinguished microscopist, has been experimenting upon the various condiments on the tissues of the oyster. He recommends lemon juice as the most valuable of these relishes, as it has the property of destroying the animalcule which infest the stomach of that mollusk.

A HEALTHY SOCIETY.—It would seem that Nutfield, in Surrey County, England, is the most healthy spot in the world, as the rector has announced that, with a population of 1200, only one man died last year, and he was 88 years old.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MOORE.—Amador Ledger, Mar. 13: The first regular cleanup of this mill was made on the 9th, and the result exceeded expectations. The run has averaged about \$10 per ton, a very flattering output, as a good deal of gouge and slate was passed through the mill. This practically settles the question of the paying nature of the Moore lode. We understand there is plenty of ore in sight, but it is expected that sinking will be resumed soon, and perhaps the other compartment of the shaft will be carried down so as to enable the mill to be kept going while the shaft is being deepened.

MISCELLANEOUS.—The St. Julian Mining Co. have levied an assessment of one and one-fifth of a cent per share. As there are 100,000 shares the assessment will amount to \$1200. The sum is required to pay for the tunnel which has been run several hundred feet during the past year. Nothing is being done at the mine at present, and work is not likely to be resumed until the assessment is collected and the indebtedness wiped out. The Bechtel mill at Angels was started last week and works charmingly. It is reported to be the most completely equipped 20-stamp mill in the State. The Kennedy is drained of water. The shaft and tunnels are found to be in excellent condition and very little repairing will be needed. Preparations are being made to commence sinking as soon as possible.

SUTTER CREEK.—The new wooden wheel to take the place of the cast-iron driving pulley which broke two weeks ago at the Mahoney mine is completed and in place. Owing to the recent storm, however, the company have decided to defer operations until there is a reasonable certainty of fair weather and uninterrupted work. The condition of the roads has brought all wood hauling to a standstill. The 30 stamps of the Lincoln are kept running steadily and everything about the mine wears a prosperous look. Mr. Stewart is cleaning up this week. There is nothing new to report in connection with the Eureka. Drifting is still in progress, with no new developments. Knight & Co. have just finished two large skips for the Gover mine. Their capacity is 560 gallons each and weight 2100 pounds. They will be taken to the mine in a few days.

Calaveras.

SHEEP RANCH.—Cor. Calaveras Citizen, Mar. 8: New excitement has recently been inaugurated here from reports from a mine recently bonded by Peter Davis near Bunta's gulch or Ide and Terwilliger's gravel claim. The bond was made to San Francisco parties, and the work has been superintended by Joseph Marshall, an old prospector of repute. He has been working but a short time and has found some very rich rock which he has exhibited in town. This is considered to be the most favorable prospect for the development of a good mine in this section.

El Dorado.

GRIZZLY FLAT.—Cor. El Dorado Republican, Mar. 13: There seems to be some stir and excitement south of town on the line. At the Old Independence mine, east of Mendon, some new and very valuable developments have been made which promise to make that old mine better than ever before. Some Eastern gentlemen are putting machinery on the Parker mine. It is reported that they have some very good ore and that they will put in a style of machinery for the reduction of the ore, from which a success is confidently expected.

NEW MILL.—Georgetown Gazette, Mar. 13: Having tested the value of the ore in the Robert Burnham mine, with a small two-stamp mill, to their satisfaction, Mr. McKinley has gone to S. F. for the purpose of procuring as we understand one of Huntington's new patent roller mills which are said to be superior to stamps for the soft material of which their lode is composed.

Nevada.

THE ALLISON RANCH MINE.—Grass Valley Union, March 13: Mr. Malleville, who is a representative of the party which has been negotiating for the purchase of the Allison Ranch mine, informs the Union, that the money is now ready to pay for the property, and that an engineer is on the way from France to perfect all the necessary arrangements for starting the work on the mine. This seems to conclude the question as to whether the French company would finally secure this old mining property, upon which they obtained a bond last season, and upon which several extensions of time were given. The purchase price is generally understood to be \$60,000. As to the value of this property there is a general unanimity of opinion among the old miners here, who were familiar with it in the days of its former profitable operation, that its treasures are only partially exhausted, although it has produced \$3,250,000. The main incline shaft is down 700 feet, which is but a superficial depth as compared to several other mines in the district which are being worked much deeper and are paying well. The mine contains much virgin ground, which will give many profitable working years under intelligent management and the improvements which have been made in quartz mining since the mine has lain idle. No doubt is felt that the Allison Ranch will again make its mark as one of the great gold producers of the State.

RICH STRIKE.—Nevada Transcript, Mar. 13: About six months ago while Messrs. Robinson, Battey & Curry were running a drain tunnel at their Ella mine on Rush creek, four miles west of town, they encountered a chute of ore heavily sulphuretted and rich in free gold. Since that time they have put the property in shape for extensive and systematic working, and are now engaged in developing the deposit. They find it to be quite large and in every way more valuable than their preliminary observations had led them to think it was. Within the next week or two crushing will begin regularly, and there is every indication that the results will be highly profitable. This mine has been opened in the face of that most serious obstacle, a lack of working capital. A long bed-rock tunnel has been run, hoisting and milling machinery has been erected and a shaft has been sunk to a depth of 900 feet. Heretofore there has been no attempt at deep

mining in that part of the township, none of the explorations extending more than about 30 feet below the surface, and yet thousands of dollars have been realized by the desultory workings of the numerous ledges that abound there.

FREE GOLD.—Grass Valley Union, Mar. 13: The 1300-level of the New York Hill mine, 200 feet north of the shaft, is showing a 12-inch ledge which carries well in free gold. Gold-bearing stringers are found making into the ledge. The south drift on the 1200 level is also being driven on a good ledge. The underground force of the mine numbers about 100 men, 60 of whom are on the regular payroll and the remainder working on tribute. The North Star mine is doing well and working a large force of men. The ledge at the bottom of the shaft is yielding high grade ore.

Placer.

DUTCH FLAT.—Placer Republican, March 13: The Alta gravel mine situated at Alta, started up today. This mine has been lying idle for some time owing to the machinery not being heavy enough to do the required hoisting, but the mine is now supplied with new and extensive machinery, and will be run night and day. It is under the management of Robert Rahut, an experienced miner of Virginia City. None but white men will be employed, which speaks well as a starter for the enterprise.

Plumas.

CRESCENT.—Cor. Greenville Bulletin, March 13: The Green Mountain mine is running with a full force of men, and perhaps in its whole history never in a more prosperous condition than now. I hear that the mill at Dixie will be fitted up in a few days to run through a lot of rock taken out by Alsop and Wing near the old Bachelard and Ellis Wing mine. I hear that the rock is very fine.

San Bernardino.

FIVE POINT DISTRICT.—Calico Print, March 13: On the 23rd of last month Messrs. Evans, Sullivan, Clark and Hart shipped a carload of ore from the Jim Blaine mine of that district, to Kingman, being the first ore shipped from that district. They will continue shipping ore if the milling results favorably. These gentlemen have four or five men at work on the mine sinking a shaft, which is now down to a depth of 45 feet. The ore in the shaft shows favorably and they expect to realize a snug sum from it. Mr. Evans informs us that a fine body of ore was struck in the Plueth mine in Five Point district.

LAID OFF.—Calico Print, March 13: A number of men have been laid off from the force of the King mine during the week. This is probably in consequence of a desire on the part of the management to give the mine a rest, or rather to let up hitting it so hard for a while. The consequent diminishment of the ore supply will not prevent the mill from working full time, as the working force of the Waterloo will be sufficiently increased to keep up its crushing capacity.

THE EXPIRATION OF BARBER'S LEASE on the Red Jacket has thrown twenty or thirty men out of employment, and has had an effect of depression on the business outlook. Mr. Barber leased the claim when there was nothing in sight, and by strict attention to business and careful application of the knowledge which years of experience have given him he developed a mine where before there was but a prospect. We wish his lease had lasted 19 years longer, for both his own and the town's sake.

PROSPECTING.—A large number of men are scouring the adjacent hills in search of prospects on which to chloride. Several who got the worst of it in the recent drafts from the King and Red Jacket mines, have sought other climes, but those remaining here are not of the kind to sit contentedly until something "turns up."

San Diego.

JULIAN AND MESA GRANDE.—Cor. Calico Print, Mar. 13: The Stonewall is running right along with a full force. Mill hammering day and night, ledge runs from four to thirty feet wide, and ore from \$12 to \$50, average about \$20. Some 60 men are employed. Owens working away on a four to five foot ledge of good ore. Hoisting works are up and pumps running. A twenty-stamp mill is to be erected in the spring. Old Owens is being worked but little; is waiting for spring and the mill. There is plenty of rich ore in sight; both of these claims have applied for patents. The Ella was bonded for \$6000 and is working well on three feet of good ore, and a sale of the same is about to be consummated. There is a splendid showing here for a first-class mine. The City of Richmond consists of two ledges, one of base and the other of free milling ore, and is being worked steadily and from present indications promises to become the best in the camp. Sandeman & Co. have taken out about 20 tons of \$40 ore which is ready to be milled, but as there is no mill within reach they are waiting until the Owens mill is built. The Hubbard is looking well in both mill and mine and a rich strike has been made in the mine. The Ready Relief is the old standby yet. It kept running when everything else shut down and it showed what could be done by economy and attention, and always pays. The Charlot is liable to start work soon; if they find the ledge below the break they will have a big bonanza. It is about time that the Helvetia was being looked after. Here is a fine property lying idle just because she broke one company who worked her on an extravagant plan. The Shenandoah is hammering away day and night and is turning out finely. It has plenty of good ore and about 18 men at work. The ore averages about \$30 per ton. Red Hill is a little darling. At 50 feet she shows two feet, solid, of a red quartz plentifully sprinkled with free gold. The owners are confident of developing a good mine.

Shasta.

QUARTZ MINING.—Shasta Co. Democrat, March 10: About 80 men are now employed at Iron Mountain. Nearly all the milling machinery for the Cresus mine on Squaw creek is on the ground. Peter Schearer has resumed work on the Tellurium mine. Jim Hall is engaged timbering the west drift. Ebersole and Habich of Newtown have leased the Dan O'Neal mill on Star gulch and are running it on good ore. We are informed that Wm. T. Coleman has bought a mine situated a short distance west of Shasta, paying \$3000 for the property. Lem Williams of Copper City was in town Monday. He says the Winthrop Company are talking of increasing the capacity of their mill. Carson & Snyder of Squaw creek are now crosscutting their vein, showing up a fine body of rich ore. Frank Davis of the

Clipper mine is still running the tunnel and the rock is showing up huge in free gold. Mr. Frick, a miner formerly of Deadwood, recently made a very rich gold quartz discovery between Lower springs and Middle creek, in which our townsmen John Major and Seldon Meade, are interested. Excepting the Schearer tellurium, it is about the richest rock in the county. The vein is about 10 inches thick, and the rock is perfectly lousy with the "yaller truck." A shaft has been sunk 15 feet in depth, and the pay ore seems to improve. Sufficient work has not yet been performed to tell how extensive the pay chute may be. Last week 600 pounds of the rock was brought to town and left at De Forrest's sampling works to be milled. Two rich silver discoveries are reported to have been made last week, the one on Dog creek near Delta and another on Shotgun creek above Portuguese flat. We failed to learn particulars. Since putting the above in type we have heard the following in regard to the Dog creek strike. It was made by a miner named Noonan, and two others are interested with him. The discovery is on McCall gulch, a tributary of Dog creek, about three and a half miles west of Delta. The vein is a little over one foot wide, and much of the ore is enormously rich in gold and native silver. They have sunk 10 feet on it and at that depth native silver is dug up with pick and shovel and small chunks of free gold are occasionally loosened. They have already realized over \$2000 from the strike.

Trinity.

LOOKING WELL.—Trinity Journal, March 13: The Thanksgiving mine, on Barney gulch, in East Fork district, Mr. Bailey, one of the owners, says is looking remarkably well. The tunnel is now in a distance of 130 feet and two ledges, running parallel with each other, have been encountered, both assuming encouraging prospects the rock prospecting in the neighborhood of \$50 per ton. Mr. Bailey is of the opinion that about the 1st of June the mine will be thoroughly prospected and himself and partner amply rewarded for their labors in the shape of a good paying property.

COMMENCED OPERATIONS.—Thomas, Luke, and Barney McDonald, of Deadwood, were here the first of this week en route to East Fork mining district. Mr. Barney McDonald will have charge of operations at the Lone Jack and Enterprise quartz mines in which his two brothers have of late become largely interested. Operations were commenced this week and work will be pushed ahead vigorously, and the arastra will be kept moving. We understand that if sufficient encouragement is found the arastra process will be abolished and a stamp mill erected. They have the capital. East Fork will yet be a bonanza camp.

RICH STRIKE.—We were shown some rock this week which came from the Rich Gulch quartz mine in East Fork mining district, that for richness eclipses anything heretofore brought to light in quartz mining in Trinity county. In fact, we might venture to assert without fear of contradiction, that it will rival, if not outrival, any find yet chronicled in the quartz regions of Northern Cal. The possessors of this valuable property are John Sheehy, (formerly of Eureka, Humboldt county,) Chas. Abbott and Dan Griffith. The ledge is three feet in width, with this rich seam several inches wide, running through it. It is, of course, not yet known how extensive or how much of the "yellow truck" is there, but we have been authentically informed that there is enough in sight to more than convince the owners that they are on the eve of becoming capitalists. The company have an arastra which has been running for the past month steadily on good paying rock, but now that this rich strike has been made they will turn out the bullion in enormous quantities.

NEVADA.

Washoe District.

HALE AND NORCROSS.—Enterprise, March 13: Drifting southward from the station at the 3200 level of the deep winze is well commenced to make connection eventually with the Combination shaft, which is to be sunk to that level shortly, but for obvious reasons the drift cannot be run to good advantage until the shaft reaches that level. The good ore found in upraising above the 3100 level, mentioned last week, has been followed upward over 40 feet, and is being stoped out and stored in the drifts. The upraise in the ore body above the 3000 level is now up about 100 feet, and will soon reach its objective point of connection with the 2900 level. The ore being removed in this upraise is also being stored in the drifts, to be raised to the surface for milling when it can be done to advantage through the Combination shaft. The diamond drill has been and still is being used in explorations from the north end of the north lateral drift on the 3100 level. A series of bores 50 or 60 feet or more in length have been driven in sundry directions toward the Savage mine and penetrating past the line, studying the best point for advancing the drift in the driest and most advantageous formation, the idea being to avoid, if possible, any strong flow of water from that direction. The drill shows good ore prospects.

CHOLLAR.—The report that crosscutting the heavy ore vein developed on the 3100 level was to be commenced forthwith was premature, there being no present intention in that line, as work is being concentrated on the drift into Potosi ground. Sinking the Combination shaft will probably be resumed next week, carrying it to the 3200 level, where it will eventually connect with a drift from the Hale and Norcross deep winze on the same level. The shaft is 3155 feet deep at present, and everything is in readiness for sinking deeper as soon as the order is received.

CON, CALIFORNIA AND VIRGINIA.—The broken main line shaft of the Eureka mill being repaired, the mill started into full operation again day before yesterday, and the mine is in full work again, ore shipping being resumed yesterday. On the 1650 level the drift northwest has reached its objective point of connection with the old bonanza ore stopes and workings, where there is much good ore left for extraction. On the 1400 level the drift southwest is in 332 feet, well timbered throughout.

BEST AND BELCHER.—The connection with the third line of pumps at the 2128 level facilitates the drainage work, but owing to the great amount of ground and openings to be drained, the water has been but little reduced in the shaft since last week's report. About 200 feet of water remains to be pumped out before the bottom of the shaft is reached. The shaft is just 2379 feet deep from the collar or

surface to the bottom, which corresponds with the 2500 level of the C. and C. shaft.

OPHIR.—On the 300 level the west drift from the old Mexican shaft is in 275 feet—material vein porphyry, with streaks of fair grade ore. On the 400 level the north drift is in 288 feet, showing no change of interest since last report. On the 700 level the joint Mexican and Union drift, running north-west from the Ophir shaft through the Ophir ground is in about 460 feet, and has passed through into Mexican ground. Good developments may be looked for shortly.

SIERRA NEVADA.—Running the main lateral drift north on the 520 level has been discontinued, the formation not being encouraging, and a crosscut east is being run about 120 feet back from the face of the drift, at a favorable looking point. This is now in 176 feet, and has cut through a clay wall, four feet thick, into a very promising formation of vein porphyry and quartz.

KENTUCK.—Daily yield about 45 tons which is reduced at the Rock Point mill exclusively. A special meeting of the company is to be held at San Francisco, next Tuesday to receive the report of the superintendent on the present condition of the mine, and to decide as to its future working.

POTOSI.—On the 3100 level the main south lateral drift from the 3100 level of the Chollar continues its excellent rate of progress, being in about 60 feet from the Chollar line, following the footwall or west side of the ore vein. The ground is dry and favorable.

GOULD AND CURRY.—Good work is being done clearing out and retimbering the old openings on the 600 level, 52 feet of the main south drift having been reclaimed during the week. Fifteen men are employed.

CROWN POINT AND BELCHER.—The 1700 and 1600 levels and the stopes between are yielding some very good ore, but the principal amount of the daily product, about 350 tons, comes from the old upper workings.

MEXICAN.—East crosscut No. 2, on the 500 level is in 230 feet from the main north lateral drift, Material vein porphyry, with streaks of clay and quartz.

UNION CON.—On the 500 level north lateral drift No. 2 has been extended 39 feet, making a total length of 231 feet. No change in material—vein porphyry.

ALTA.—On the 700 level the main lateral drift north has reached within about 80 feet of the Benton ground. Material vein porphyry.

YELLOW JACKET.—About 130 tons per day is the average yield from the old ore stopes, which is reduced at the Brunswick mill.

JUSTICE.—Considerable exploration work is being done on the 350 level at the south end.

Aurora District.

THE ESMERALDA MINES.—Cor. Alta, March 12: The mining outlook in Esmeralda county is better than it has been since the booming days of Aurora, when the Wide West and Real del Monte stock brought the high Comstock figures, and when poor men were suddenly raised to millionaires. Sleepy old Aurora, the streets of which for years were deserted, has awakened and taken on new life. An English company has invested largely in the mines in and near Esmeralda's old county seat, and preparations are being made to work several of the lodes there on an extensive scale. That camp at one time showed some of the richest silver-bearing ore ever worked in Nevada. The Mount Corey, near Hawthorne, the present county seat of Esmeralda, is not being worked at present, but operations will probably be resumed in this fine mining property during the present season. The Mount Corey, owned by James C. Flood, has splendid reduction works on it, which cost upwards of \$300,000, and the leaching process was successfully used in treating the ores. The Lapanta mine, about ten miles from Hawthorne in an easterly direction, was recently purchased by an English company for \$450,000, and will be systematically worked. The Alta's informant stated that during the last six months English capitalists have invested \$200,000 in mining property in Esmeralda county.

Como District.

STOPING.—Virginia Enterprise, Mar. 12: John J. Hepworth was over from Como yesterday. He says they have sunk an air shaft on the North Rapidan ground, a short distance north of the main working shaft, and connected with it from the 160 level, giving good and much-needed ventilation. They have resumed stoping out ore, and will accumulate it on the dump until the roads get good again, when the ore will be hauled to the Rock Point or some other mill on Carson river for another run. The Symons boys are industriously working their Como-Eureka mine and getting out some pretty good ore. Considerable snow fell in Como during the last storm, yet the weather has not been severe enough to interrupt work to any appreciable extent.

AIR CONNECTION.—Lyon Co. Times, March 13: The air connection was made this week in the North Rapidan mine in Como. It has been quite an undertaking for the company to perform this work, as the bad air has allowed but one or two men to work in the mine at a time. It is understood that in a few days a force of six or eight men will be put to work to take out the rich rock that was struck some months ago. By the time the road, which is now being fixed, is in complete repair, another lot of ore will be ready for shipment.

Eureka District.

THE EUREKA CON. AND RICHMOND.—Eureka Sentinel, Mar. 13: But little is heard about town nowadays of the mining operations of the Eureka Con. and Richmond companies. According to street rumors, a station is being excavated on the fourth level of the first named property to accommodate a diamond drill, which will be used to prospect a block of ground in that locality. Some 60 tributaries are working in the mine. At the company's reduction works upwards of 1,500 tons of ore have collected, and report has it that the furnaces will start up again about the 1st of April—probably before. Some four weeks ago, most of the miners in the Richmond were laid off until certain necessary repairs were made to the machinery of the hoisting works and in the shaft of the mine. The repairs were completed a week ago, and the miners resumed work. Many of them are tributaries and are said to be doing well. Considerable ore has already collected at the company's reduction works,

and there is a probability the furnaces will again be fired up within 30 days.

Garfield District.

SILVER.—Lyon Co. *Time*, March 13: About 600 pounds of very high grade silver rock from the Hindley mine, Garfield district, was received here last Saturday. The rock is very fine, and assays \$2,451.63 per ton. The ledge from which it is taken is now about 18 inches wide. The Hindley is owned by C. H. Ruli-on, G. W. Likens, W. W. Byron, Harry Cobb, G. C. Fish and other parties in Dayton, and is an extension of the Great Western mine which is owned by Archie Farrington. The strike has caused considerable excitement in Garfield district. The 600 pounds of rock were sent to the Selby Smelting Company of California.

Pioche District.

CHLORIDING.—Pioche *Record*, Mar. 13: The different men who have worked in the Mendham mine chloriding have all made good wages. We learned from Barney Cronin the Grant Porter crowd averaged about \$6 a day, after paying one-third to the company. Cronin and his partner, while they chlorided there, made \$5 per day. Now Pete McKee and partner are there. The men cannot work in the Mendham ore-body any length of time, without getting leaded. All of the men who worked there of late received a severe dose of lead, and gave it up in disgust. When the company ran the mine they employed nearly a double set of miners; one-half of them generally being leaded.

Tuscarora District.

GRAND PRIZE.—*Times-Review*, Mar. 8: The stamps at the Grand Prize having finished crushing the ore on hand, were hung up Saturday evening, and the cleanup will probably be completed to-day. Stoppers will be kept at work in the mine, and another run will doubtless be made in the course of a few weeks.

ARIZONA.

A CHANCE FOR PROSPECTORS.—Yuma *Sentinel*, Mar. 8: Between Silver district and old Eureka district this country is a belt of country, in every gulch and wash of which is found float lead running high in silver. The ledges from which this float comes are blind, but the country is so open that careful prospecting cannot fail to uncover the lodes. It is the softest and prettiest chance for skilled prospectors with a little grub stake to make a raise. At the present price paid for lead and silver averaging 40 ozs. per ton, facilities for shipping \$11 per ton to San Francisco, delivery of water at \$1 per barrel and supplies at reasonable rates from the local store of J. Detelbach, through whom ore could be shipped—it discounts wages with less hours, and the mines are certainly there.

TOMSTONE.—*Democrat*, March 8: Work on the Grand Central pump rods has not yet been commenced; but when the coupling plates arrive, which will be in a few days, the rods will be trimmed into shape and placed in position. It will require about 30 days after the plates arrive before the pumps will again be in working order. The most noticeable fact in making a tour of the district is the cheerful view of the future which seems to be shared by all interested parties. Everybody, from the holder of an undeveloped claim to the possessor of the hill bonanzas, seems to be imbued with this feeling. Of course, the result is perceptible on every hand, additional men are daily put to work, and scores of properties which have for years attracted little or no attention are now being tested for the first time.

TOMSTONE MILL AND MINING COMPANY.—The regular product of 2,000 tons monthly is still being reduced at the Girard mill and the Charleston smelter and concentrators. This handsome output is mainly taken from the 200 and 300 levels of the Toughnut. This mine, one of the first located in the camp, has proven also to be one of the best. With the possible exception of the Contention, it has produced more bullion than any other single location in the district.

GRAND CENTRAL.—Forty tons daily are being raised from above the 400 level. The mill is running day and night, and but for the extra expense in making preparations to control the water the Grand Central would be paying its old-time monthly dividends. There is not a share of stock for sale, and the owners were never so hopeful and confident as at present.

CONTENTION.—The ore body on the 600-level is being worked and about 30 tons raised daily. The ore from this level carries a much higher percentage of gold than any other body heretofore encountered in the mine. As soon as the pumps are started work below the 600-level will be pushed vigorously.

VIZINA.—Under the energetic superintendency of Captain Taylor, this reliable producer is bidding fair to regain its old-time place in the rank of paying Tomstone properties. Eighteen men are now employed, twelve of whom hold leases on portions of the underground workings.

PERSEVERANCE.—This mine was spoken of last week as the Lillian. The rich strike mentioned last week increases in richness under development. The vein has an average width of three feet at a depth of 50 feet.

STATE OF MAINE.—Work on the 500 level is being pushed. Several rich pockets were struck during the past week. For the month the usual shipment of forty tons has been increased to sixty.

EMERALD.—On the 600-level of this property a strike of considerable magnitude was made this week.

COLORADO.

RUBY DISTRICT.—Elk Mt. *Pilot*, March 8: We must not lose sight of the fact that Irwin, the Ruby mining district is probably the best mineral producing district in the country. At least the quantity and quality of the ore will prove that. During the month of February there was shipped about 95 tons of ore which is valued at not less than \$15,000. To produce this amount of ore it required the labor of about sixty men. The pay roll for these sixty men would be about \$5,000 for the month, so that in round numbers one can see that Irwin is self-sustaining before paying a handsome profit, which can be said of no other camp in the country. Of the hundreds of prospects located and worked a few years ago there are only three mines in the district that are working

and making a reputation for themselves. The Forest Queen is working about thirty men and shipped last month 55 tons of ore. The Bullion King is working about twenty men and shipped last month twenty tons of ore. The Ruby Chief, which has recently developed a rich streak in the vein, is only working five men and shipped twenty tons of ore. Either one of these mines is sufficiently developed to give employment to not less than fifty men, but the managers, all of whom are good, practical men, profiting by the experience of others, prefer to be more cautious, and work the property after a fashion of their own. There are other properties that might be made just as valuable if they were vigorously worked. The owners of the Hopewell are pushing work on this property and they will some day have just as good a property as the Ruby Chief, from the fact that it is the same vein. The St. Johnstown lode is situated on the hill south of Coal creek, and back of where Eckerly's mill used to stand. Pat Connelly is working this property and he has pretty good assurance of a good mine some day. It is believed to be the same vein as the Fairview, as it runs in that direction, and the character of the rock is identical to that of the Fairview. The Gunnison smelter has started operation, and has a capacity of about fifty tons per day. Mr. Lawrence is getting much of his ore supply from Aspen, which is being hauled to Crested Butte and loaded on the cars.

IDAHO.

WOOD RIVER.—Salt Lake *Tribune*, Mar. 13: Mr. G. A. McCornick, banker of Bellevue, Idaho, is in the city on his way East. In a conversation with Mr. McCornick a *Tribune* reporter learned some Wood River items of interest. The town of Bellevue, he believes, has a bright future, and in support of this he says: "Our monthly payroll is over \$20,000. The Queen of the Hills is working over one hundred men, and is showing well, the ore output being ready and shipments regular. The Minnie Moore is working fifty men, and is under the new management, developing again into a big property. Up at the head of that gulch, the mines belonging to Mr. Callahan promise to become a great property. The Lark a short distance below Bellevue, is looking well, and has turned out in simple development work, forty to fifty tons of good ore. As soon as Mr. Miller returns from Europe in May or June, machinery will be placed on this property." "Have there been any other new properties opened up this winter?" was asked. "Yes, you know that on the east side of Bellevue but little has been done. Messrs. Plughoff and Longbottom have opened a ledge there which yields 160 ounce silver ore. Their first shipment brought them \$2800. We had a splendid winter, the snow falling to a depth of two and a half feet and lying on all the season. It is now between Bellevue and Hailey, about one and a half feet. Between Broadford and the Bellevue depot the snow has been worn out in hauling ore and wagons are now used."

SNAKE RIVER PLACERS.—Ketchum *Keystone*, March 8: Considerable interest has been awakened lately in placer mining along Snake River. Parties have taken up 1,000 acres of ground, and a move is being made to incorporate a company for the purpose of working the ground. The majority of the miners along the river are not inclined to the theory that the fine gold originally came from the headwaters of the Snake, but from the extensive lava fields. Pay dirt is found away back from the river, high up on the plateau, among the sagebrush, where it would seem from indication that the river never once flowed. The gold is saved by the improved burlap machine, the average size of which is 6x24 feet.

MONTANA.

ENCOURAGING.—Butte *Inter-Mountain*, March 8: This week has been an encouraging one among the mines. Several prominent ones have shown a marked improvement in their latest developments, and in others necessary dead work has been completed which unlocks ore bodies heretofore unavailable. Several leases that have been worked in a small way have changed hands and will in the future be developed more extensively. There are a number of sales on the point of being consummated. All the silver mills are fully supplied with ore, and with the exception of the Montana Copper company all the smelters are running as usual. At the Alice, work is being done on all the levels from the 100 to the 800 foot, inclusive, and more ore is being produced from each. At the 900-foot the station is being cut out by Ingersoll drills, and the shaft will be sunk to the 1,000-foot station as soon as possible. Thus far this mine has held its own as depth has been gained. The ore in the 800-foot level compares favorably both in quality and quantity with that nearer the surface. The new air compressor is working to perfection. At the Magna Charta work is also being done on all the levels to a depth of 700 feet, the present depth of the shaft. The mine is looking well and producing its usual quantity of ore. On the Curry the company are drifting west on the 100-foot level. The vein is looking fairly and carries about 18 inches of ore. At the Valdemere they are stopping above the 118-foot level and are taking out an argenteriferous manganese ore which when mixed with the baser ore aids chloridizing them. These four mines—the Alice, Magna Charta, Curry, and Valdemere—are owned and worked by the Alice Co., and produce daily 300 tons of ore. At the mines and mills 340 men are employed. The Moulton has its pump running at the 700 foot station. It is working perfectly. Cross-cuts will be begun at this point within a few days. Work is being done on the 500-foot level and on all the others above it. The mine is looking better to-day than at any time for the past year. Heretofore thirty stamps of the mill have been running on custom ore, but hereafter only twenty will be reserved for that purpose. At the Amy and Silversmith the new 60-horse power boiler is in place, and will be housed by the middle of next week. Work on the west shaft of the Goldsmith has been suspended for the present. At the east shaft they are stopping between the 150 and 250-foot levels. The pay streak is from one to four feet wide. On the west end of the Rock Island, Youton Bros. & Co. have a lease, and are drifting east and west at a depth of 200 feet. The mine is looking well and producing rich ore. At the Parrot the 430-foot, and the three levels above it are being driven. Stopping is also being done over the first three levels

The mine is producing its regular 300 tons of ore per day, and yet is not exhausting its reserves, as the new ground being opened develops as much ore as is being taken out. Lower Independence district mining in the vicinity of Burlington is steadily on the increase, and there is but little doubt that this place will be a lively camp next summer. It is currently rumored that the owners of the Bluebird have recently purchased land for a mill site near there.

THE PYRENEES MINE.—*Inter-Mt.*, March 8: The Pyrenees mine owned by Mr. Salton Cameron and Mrs. Beattie Moss was purchased from them by a syndicate of Butte capitalists a few days ago and will soon be more thoroughly explored and developed. The purchasers have incorporated under the laws of the territory with the following named gentlemen as trustees: Messrs. J. Ross Clark, J. K. Clark, C. H. Moore, J. B. Cleveland and George W. Stapleton. The price paid for the property is \$30,000. It is now capitalized at \$500,000, having 100,000 shares of the par value of \$5 per share. It is the intention of the new company to proceed with developments upon an extensive scale. Ten additional stamps will be added to the mill plant, and other improvements looking to the reduction of the rich ore bodies in the mine will be made at an early day. The Pyrenees will soon be counted among the great precious metal producers of the territory.

NEW MEXICO.

SOCORRO.—*Bullion*, March 8: The Humboldt mining company, has struck a rich body of "royal metal" on one of its claims in the Cuchillo Negro mountains. Mr. Gustav Billing has purchased two gold-bearing properties in the Pueblo district, and located two extensions. The main claim is named the Helena. The property owned by Hon. F. A. Manzanares and Don Antonio Abeyta Montoya is being exploited by Joe Eaton, Wanless and Bentz. They are shipping the product to Socorro for treatment. The Iron Mask is the scene of active work, and the only obstacle now in the way of a large amount of development upon this property is the vast amount of water, which is difficult to keep within limits by the pump. Notwithstanding this impediment work proceeds regularly, and their force will be immediately increased as soon as the valves for the pump, now in transit, arrive. Messrs. Crawford and Richardson from the East, who are interested in this mine, are visiting the camp, and we are informed that they express themselves as entirely satisfied with its present outlook. Wm. M. Glasston has been industriously working the mines owned by himself and the Rev. J. M. Robinson of this city. The properties are situated in the Middle Oscura district, and afford argenteriferous copper and argenteriferous galena. The lodes are wide and the mineral continuous. The construction of the Socorro & White Oaks railroad would place their properties on a paying basis; as it would afford an outlet for their product. The galena gives assays of 52 per cent, lead and 42 ozs. silver. The argenteriferous ores run 6 per cent, copper, 10 ozs. silver and \$12 in gold.

OREGON.

PLACER AND QUARTZ.—Jacksonville *Times*, March 4: Considerable prospecting is going on in the vicinity of Phoenix. John Haviland is working his hydraulic mine near Kerbyville, and doing very well. Another vein of iron has recently been discovered on Burrage & Pomeroy's land in Rock Point precinct. A carload of ore from the Great Republic mine near Woodville is expected at Medford on the next freight train. Mage Carter of Ashland, who has found a ledge near that place, exhibited some fine-looking ore while here this week. B. F. Miller has leased his mines on Sardine creek to E. G. Hurt and the Messrs. Redden of Medford, who have commenced to develop them. C. C. Beekman, upon whose land on Jackson creek some good quartz mines are located will probably have some of the ore tested before long. Wm. Swinden is still taking some rich quartz out of his ledge on Blackwell, which pays well. Dodge Bros. have an extension that is quite promising. Wimer & Sons and Desells and Connell of Josephine county have a fine supply of water, and a very good report may be expected from them at the end of the season. L. D. Brown & Co. have purchased the interest of Chas. Kearns in a promising ledge on Jackson creek. They have purchased interests in several other mining properties. M. L. Pellett and J. Garvin of Wagner creek have one of the largest and best defined ledges yet discovered. They have prospected it considerably and report much ore in sight. A considerable amount of work has been done at Hays & Magruder's mines near the junction of Rogue river and Sam's creek, and cleaning up will soon be commenced there. The machinery of the new quartz mill at this place is being put in position as rapidly as possible, and will soon be in running order. Much benefit is anticipated from this enterprise. Water has been failing in many of the gulch claims of this and Josephine counties and a heavy rain alone will extend the season's run there; cleaning up is in progress in such places. Messrs. McClendon, Douden and Roberts have a very promising ledge on Gold Hill. They have taken out about \$300, and the ore they are now mining seems to have considerable free gold in it. The County Clerk is kept busy recording notices of locations, which shows that prospectors are active and many claims are being taken up. Fred Otten was up from Foothills creek this week, and reports the miners still busy, and some quartz excitement there also. He says that Messrs. Whitney, Cook and others have made some promising discoveries in that vicinity. D. M. Marden who is mining on Kane creek, found a nugget of quartz in his placer diggings containing several dollars in gold, not long since, which is evidence that a rich quartz ledge exists somewhere in that vicinity. Three tons of quartz from Walker & Anderson's ledge on Applegate was reduced at the Medford works a short time since, and it is said the result is quite satisfactory. We are informed that some of the ore went as high as \$90 to the ton. E. W. Jones of Portland has been engaged in superintending the putting together of the quartz mine at this place, and expects that it will be ready to commence running this week. Considerable ore is being hauled there already. Several nice pieces of gold have been picked up in Bybee & Hall's hydraulic mine near Kerbyville. They will not make as extensive a run as expected this time, but will dig a ditch next season to furnish the requisite amount of water,

The pleasant weather and cold nights are reducing the water supply perceptibly, and some of the placer miners have commenced cleaning up. The hydraulic claims all have plenty of water as yet, although a heavy rain would be very acceptable just now. O'Donnell & Ray, who are interested in the rich pocket found on Gold Hill a few weeks ago, still have the quartz they took out sacked up, so that none can tell how much they have actually found. They have sent for a small machine, costing about \$25, with which they will crush their own rock. Sol Lingle returned from the Gold Hill district this week, and reports a great deal of bustle still in that camp. He says some rich discoveries have been made, but whether they will prove of any permanence remains to be seen. Some of the quartz prospects exceedingly well, in a few instances going as high as \$1 to the pan.

UTAH.

SILVER REEF.—Southern Utah *Times*, March 8: The Stormont Co. produced 16,000 ounces of silver bullion last month. The shipments of ore from the mines to the mill, averaged thirty-nine tons per day, last week. The main incline in the Buckeye & Savage, has been sunk 150 feet below the 600-foot level, and a cross-cut was started for the hanging this week, at a point 125 feet below the sixth, leaving a sump twenty-five feet in depth. Work on the cross-cut in the Thompson is progressing, and the ledge is improving as the foot wall is approached. A streak of very good ore was encountered this week. The mine is now producing an average of 100 tons of ore per month.

THE CHRISTY CO.—The bullion output of this company, for the month of February, was 21,000 ounces of silver. Everything is running smoothly at both mill and mines, and the usual quantity of ore is being crushed. A cross-cut is being run for the top vein from the bottom of the working winze in the new shaft. The following ore shipments were made to the Christy mill this week: Couch & Knowlton, eighteen tons from the Silver Flat; M. Shoenake, eleven tons from the Maggie; James McDonald, five tons from the Tecumseh; Lockridge & Robinson, five tons from the Tecumseh. The new leaching works are running through between seventy-five and eighty tons of mill tailings, every twenty-four hours, with flattering results. If the same success will be met in reducing raw ores, and if chloriders will be paid a bonus for \$15 and \$20 rock, there will be as many miners at work on the White Reef, before Summer is over, as there are now at work in the mines on the Buckeye Reef. The owners and lessees of the Bonanza, Honest Miner, Leeds, Little Chief, Silver Gate, Gisburn and other mines on that side are anxiously waiting to see what price the new company can afford to give for custom ores. These mines have thousand of tons of ore in sight that will assay from \$15 to \$30 per ton, and if this character of rock will pay to extract, the leaching works will not want for material to run on for a long time to come.

THE CHRISTY.—Southern Utah *Times*, Feb. 28: A station is being cut on the 600-foot level, in the California, preparatory to sinking the working winze 100 feet deeper. The second level in the Maggie and the stopes in the third California were connected by a drift this week. Connections have been made with the lower stopes in the New Shaft, and ore is being extracted from these stopes as well as in those in the uprise. The mine is producing an average of seventy-five tons of high grade ore per week. Several chloriders made small shipments from Tecumseh Hill during the past week, and there are between thirty and forty tons of chloriders' ore piled up on the hill, but the mill was too busy running through company ore last week and will not be able to accommodate outsiders until after the 1st.

THE LEACHING WORKS.—A force of men was put on at the new leaching works this week, and the concern put in full operation. A number of alterations and improvements have been made since the plant was put in place, and every part of it now operates perfectly. Several tons of mill tailings were run through last week, as an experiment, giving results that were highly satisfactory to the managers. The rolls and rock-breakers are being placed in position, and when completed the company will be ready to crush custom ores. In the meantime they will work mill tailings, of which they have between 15,000 and 20,000 tons on hand. The success of the process in reducing our low grade ores, is beyond a doubt, and if the management will but act fairly with the chloriders, it will be a big thing for themselves and the camp. The Butte mine which looked so promising two weeks ago, has petered. The ledge which looked so well near the surface began to grow smaller as it went down, the hanging and foot walls began to gradually come closer together, until finally, last week, they joined in the country rock and disappeared without leaving a trace or marker of the fine vein of rich ore that appeared when the prospecting shaft was started. The lessees have about given up all hopes of finding a mine on the Butte ground; and this property, which was so big a bonanza when filled with water, will be abandoned as worthless.

WASHINGTON TERRITORY.

THE COLUMBIA BELT.—Stevens Co. *Miner*, March 13: A new strike has been made on the Columbia river belt, near the Little Dalles, which promises to rival any former discoveries. We could not learn the particulars, but from our knowledge of the lay of the country up there it is reasonable to believe, that the purported find is of no small consequence, when we consider the fact that the richest mines now being developed in this region are located on this great mineral belt. From a short distance northeast from Fort Spokane, this ore bed, measuring from 8 to 10 miles wide, can be traced through the mountains straight along for a distance of 80 miles, including in its course Riekey Hill, Gold Hill and Young America camps, which are all being worked heavily by stiff companies, who have confidence in their prospects, and are not afraid to put their money where it will do the most good, employing several hundred men in the development of their prospects, putting up mills and preparing for the erection of smelting works. About the point where the news falls from on the east side of the river is where the belt turns and runs at right angles southeast, and can be traced through the mountainous country, and shows up good prospects all the way to Butte City, M. T.

1850. 1885.
RANKIN, BRAYTON & CO.,
...BUILDERS OF...
MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE TRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

HOSKINS' Patent Blow-Pipe & ASSAY FURNACES

FOR CHEMISTS, ASSAYERS, METALLURGISTS, ENGINEERS, JEWELERS, DENTISTS, Etc.

NO DUST,
NO ASHES.
Portable,
Practical.
Automatic,
Economical.

Will do for
every thing
that a
Coal Furnace
—OR—
Gas Furnace
will, and
WITHOUT A
BLOWER.

Send for price list and Descriptive Catalogue. JUSTINIAN CAIRE, 521 Market St., S. F.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF HYDRAULIC GIANTS, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et al.

Prices furnished upon application to
JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont St., San Francisco, Cal.

This cut represents our
IMPROVED
HYDRAULIC
MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Send for Circulars and Price List.
HOSKIN & CO., Marysville, Cal.

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take the valve off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrounding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be disconnected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by
DUNHAM, CARRIGAN & CO., San Francisco, Ca.

SQUARE FLAX PACKING.

Finest Packing in the world. Trial Samples sent free. Send for circular. Best of references. Manufactured by W. T. Y. SCHENCK, 256 Market St., San Francisco.

THE ORIGINAL Roller Ore Feeder.

(PATENTED JUNE 24, 1873.)

This form of Ore Feeder is well adapted for its peculiar work. Manufacturers of the celebrated "Challenges" Ore Feeders for any character of ores; also "Stanford Improved" Ore Feeders and Tullock's Ore Feeders for dry ores.

Prices furnished upon application to

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont St., San Francisco.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar or repairs.

...SOLE MANUFACTURERS OF...

KENDALL'S PATENT QUARTZ MILLS.

Having renewed our contract on more advantageous terms with Mr. S. Kendall for the manufacture of his Patent Quartz Mill, we are now enabled to offer these mills at GREATLY REDUCED PRICES. Having made and sold these mills for the past five years, we know their merits, and know that they have given perfect satisfaction to purchasers, as numbers of commendatory testimonials prove. We feel confident, therefore, that at the prices we are now prepared to offer them, there is placed within the reach of all a light, cheap, and durable mill that will do all that claimed for it and give entire satisfaction.

CALIFORNIA ARTIFICIAL STONE PAVING CO.

(SCHILLINGER'S PATENT.)

—FOR—

SIDEWALKS, GARDEN WALKS, CORRIDORS, OFFICES, CARRIAGE DRIVES, STABLES and CELLAR FLOORS, KITCHENS, Etc.

The Courts here and in the East have decided that Artificial Stone Pavements with plastic concrete and in detached blocks, are infringements on the Schillinger Patent; and also, that when the plastic material is blocked off with a trowel and cut through far enough to control the cracking caused by shrinkage, that such pavement is in law the same as if laid in detached blocks, and is an infringement of the patent. All property-owners having such pavements laid without the license of the above Company, will be prosecuted.

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.**

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS.
(\$575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco. As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement. The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them. Protected by patents May 4, 1869, Dec. 23 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for. N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

A Big Pumping Plant.

The San Francisco Tool Company's Latest Machinery.

An immense pumping plant was completed this week at the San Francisco Tool Company's shops, and is now being shipped to its destination at Walnut Grove, about 15 miles below Sacramento, where it is to be used in reclaiming land. The pump is the largest low-lift pump ever built on this coast, and the outfit is probably the largest single reclamation plant in the United States. The diameter of the discharge pipe is 40 inches, and the runner is of the same dimensions. The capacity is rated at 40,000 gallons a minute, 2,400,000 an hour, or 65,600,000 gallons in 24 hours. The engine is of special design, very compact and well made. It is a compound engine, the bed being made hollow so that the steam from the high-pressure cylinder enters the low-pressure one, through the bed of the engine. The total weight of the engine, pump and bed plate is 16 tons. The three boilers are already on the ground. The pump has only to raise the water 10 feet to 15 feet to throw it over the lever.

The pumping plant was made for the San Francisco Savings Union. The contract was made between P. J. Van Lohen Sels, president of the Walnut Grove reclamation district, and the San Francisco Tool Company, this being the third pumping plant he has purchased from them. The others were 15-inch pumps. This new one was added as a measure of safety, and to quickly get rid of the rain water.

On Wednesday last a number of gentlemen met at the shops of the Tool Company to see the engine in operation and examine the pump. Mr. Van Lohen Sels stated, after the party had adjourned upstairs, that he made up his mind to have this new pump to cope with the rain water, and on February 2d spoke to Mr. Ira Bishop, of the Tool Co., concerning it. At that time there were no drawings or anything else. Notwithstanding the short time, the whole plant was now ready for shipment, in seven weeks' time. He thought the Tool Company deserved special commendation for their work, and he expressed his special appreciation of the skill of Messrs. John Richards, Ira Bishop and Arthur F. L. Bell.

Mr. Wm. Aldrich, the president of the company, said that when they started these works it was thought by some that the field was already filled. But they began with one idea in view, and that was to build high-class machinery, put in the best work, and he prompt. The only chance for an opening was to do these things, and they have lived up to the idea as well as they could. They made every tool in their shop themselves. To do the work well and deliver it promptly was their only dependence on business. He felt grateful for the pleasant words spoken by their patrons of their efforts, and was glad to see that their work was appreciated.

Mr. Bell, who was present, referred to the kindness shown to his son, A. F. L. Bell, by Messrs. Richards, Bishop, Aldrich and the

others. He said that long since he had made up his mind to make mechanics of his boys, rather than clerks, and it was pleasant to acknowledge that the officers of the Tool Company had taken an interest in encouraging a young California mechanic, and giving him credit for his work.

A representative of the MINING AND SCIENTIFIC PRESS in referring to Mr. John Richards, the originator of the company, stated that when he first came to this city, he began at the bottom, and accepted the position of a draughtsman in one of the foundries, saying nothing of his high abilities. But his skill and genius soon

Lower California Mines.

The mining regions of Lower California are now again attracting attention. The great difficulty of the country generally is lack of water. Several "dry placers" have been found which would pay handsomely could water be obtained. There are several good mines, however, being worked, which are paying well. A small mill was sent down not long since to a gold ledge, which is reported to be panning out nicely. The San Nicolas gold mine, near the Real del Castillo, is turning out good ore, upon which the mill is kept running, and work will soon be

Mines Up North.

Owing to lack of water they have been having some difficulty with the big 120-stamp mill in Douglas Island, Alaska. The mill, concentrators, electric lighting plant, etc., have been run by water power, Knight and Pelton wheels being used. The prevailing cold weather of late has made the water supply short, and only \$77,000 was shipped last month. It is stated that the mill will soon be supplied with steam machinery, to be used hereafter when the water supply is short.

There is said to be quite an excitement at Juneau, Alaska, over mines found on the Yukon river. About 125 men have already left the old mines at Juneau to go to the Yukon, and 60 more were about starting at latest advices. The cause of the great rush was the fitting out of 11 men, with 5000 pounds of supplies, by Captain Carroll and his partner, W. M. Murray, who have had men in that country two years, and it is expected that they have struck something rich. The captain was interviewed by a delegation of miners, but would give no information as to the strike. There have been several prospecting expeditions to the Yukon river, and although gold was found, it was not in sufficient quantities to pay in that region. The next steamer will probably bring further news of the find and the exact locality. The Yukon is one of the largest rivers on the continent.

It is stated by a recent arrival from the Cassiar mines that Messrs. Thibert, Moore and Law, who have been working on Mosquito creek, have struck it very rich in their tunnel. Several new locations have been made on the creek since the strike. The winter has been very cold at Cassiar, the thermometer standing at 55 degrees below zero for fifteen days.

A VERY skillful piece of engineering in a water tunnel at Riverside, San Bernardino county, came to a finish last week, when the two forces of hands working in from each end of the tunnel met. The tunnel is over 3,000 feet in length, and part of it is a curve, yet so true were the calculations made, that when they met in the center there was not one-fourth of an inch difference in the two divisions.

THE American Consul at Guaymas, Mexico, has informed the State department that two Californians, named William Brown and James Moses, owners of the Grand Republic mine at Nacosari, in the district Montezuma, were killed by Mexicans a short time ago. This makes five Americans in all who have been killed at that mine within a year.

GEORGE HEARST, who has just been appointed United States Senator from California in place of the late General Miller, by Governor Stoneman, is well known as a prominent mining man. He has large mining interests not only in California and Arizona, but all over the coast, and has accumulated many millions by his mining ventures.

15-INCH PUMP AND TWO ENGINES FOR LIFTS FROM 30 FEET TO 50 FEET HIGH.

forced itself upon the knowledge of others, and, though a modest man, he has long been recognized as one of the most thorough mechanics of the city, ranking with Scott, Dickie, Moore and others of acknowledged ability who have been long with us.

The engraving on this page, though not a picture of the big pump referred to, shows one of the pumps of which it is a type. The engraving represents a plant intended for water works where the lifts do not exceed 50 feet in height, and where large quantities are to be handled. For this two upright single-acting engines are used to operate the pump. The pump is a 15-inch one for lifts of 30 to 50 feet, and has a capacity of 14,400,000 gallons in 24 hours.

FASTEST STEAMER IN THE WORLD.—The new torpedo boat built for the English government in London by Yarrow & Co. has attained the wonderful speed of 24.027 knots, or 27.66 miles, an hour. This beats the record of the American steam yacht *Shiloh*, built by Herreshoff, and makes the English craft the fastest steam vessel in the world.

A HUNTINGTON mill, engine and rock breaker has been put up at the Reilly & Mathews mine on Squaw creek, Shasta county.

commenced on the San Francisco. The talc mines are producing a large amount of fine white talc, for which there is an increasing demand for the manufacture of the finer grade of wall papers, embossed cards, etc. A correspondent of the San Diego *Union* writes that negotiations are pending for the opening up of the old tunnel group of mines, and starting up the mill. These mines have turned out a large amount of gold, but have never been properly opened. The new vein is two and a half feet wide and yields \$220 per ton by mill process. It is free milling gold ore. Negotiations are also pending for the great nickel mine, known as "Allen's King of Nickel," also for the "Bay State" nickel, the "Alum Deposits," and for two or three of the mica veins, and for two or three of the copper mines. These are all English companies, with plenty of capital. It looks upon every side as if the frontier had entered upon a new era of prosperity.

THE placer diggings recently discovered near Glenn's ferry on the Snake river, Owyhee county, Idaho, are attracting considerable attention.

SPEAKER CARLYLE does not think that the present Congress will pass any bill suspending silver coinage.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Dillon, Montana.

[From Our Traveling Correspondent, F. G. HUSTON.]

On getting hitched up to leave Bannack for Dillon, it commenced to snow, and for about an hour we could not see across the street. However, it cleared up and I pulled out, as I was afraid to stay longer, thinking I might get snowed in and not be able to get across the range. Bannack for many years was the county seat of Beaverhead county. When Dillon was established, however, and grew so rapidly, it being nearer the center of the population of the county, it was made the county seat. The people of Bannack are now discussing the building of a wagon road down Graepper creek, twelve miles, to the Beaverhead, and thus have a railroad within twelve miles. If that is done, the Dillon people will probably lose the Bannack trade entirely, except so far as county seat matters are concerned. It will only be a natural result to arrive at, that they will build this grade, for a saving of wagon transportation for twelve miles is quite an object even for a sparsely settled community. For a town like Bannack, with the mining expectations to back it, this mere hagbelle to build a wagon road through a canyon for twelve miles will not long delay them.

Tin Mines in Montana.

Southeast of Dillon 12 miles is a location that is developing a fair percentage of tin. This discovery was made a long time since by John Gray, and samples were sent to different places. The different analyses made returned iron ore and a half per cent tin to 11 per cent, but the more exciting race after riches in placer gold mining this was overlooked and forgone, having been for years unthought of. Mr. Gray left Montana and went to New Mexico, and one night there in a hotel bar-room was describing the tin mine he discovered in Montana twenty years before. This was overheard by Major J. W. Peck, who soon after hunted up Mr. Gray and told him if he could verify his statements he had a good thing. He gave him the names of the parties to whom he had sent ore for analysis, and he at once opened communication with them and found the record as Mr. Gray had stated. He then satisfied Gray from a financial point of view and started for Montana to rediscover the mine. This he had no difficulty in doing through Gray's data. Since this time he has been busy at work developing, and now is organizing a stock company to operate it. His success seems to be assured. The company is to be called the Montana Tin Mining Company. There are two locations—one the original discovery, called the Belmont, and an extension, called the Globe. The company is to be incorporated with \$2,000,000 capital stock; a number of the solid men of Montana are taking shares. No doubt by the end of another mining season this mine will be heard from in a satisfactory manner. The ore contains nickel, cobalt and manganese, and also a trace of gold, and the mine is very conveniently situated, as a team can be driven right to it without difficulty. The mine is of what is termed "hlankety" and in granite and porphyry formation. The developments thus far are two tunnels, each in about 70 feet, and the showing is about the same in each of these. The rather singular manner in which this mine has come to the notice of the public makes it almost an object to listen to old miners' stories, even if "whisky is in and wits out." Leaving Dillon, I travel

Down Beaverhead Valley

Through a continuous line of fine farms, well improved, with large, fine houses and large barns, giving evidence of a prosperity continued through a long term of years. Most of the men engaged in ranching here have combined either one stock interest or the other with their farming, and thus each one has a hunch of either horses, cattle, sheep or hogs. These will always bring money, so they range their stock on the foothills near by in the summer, and then in the winter feed them for the Butte market in the spring. Twenty-five miles down the river I came to Mr. James M. Page's, one of the "old-timers" in Montana, whose latch-string is always out, and he says particularly so to newspaper men, as they are sociable fellows. Mr. Page is an old soldier, and I was made to feel right at home for the time being, family style being quite a change from the usual roadside inn fare we are accustomed to get along the road. Twin Bridges, a few miles below, is a small town near the junction of the Ruby, Beaverhead and Big Hole rivers, forming the Jefferson, and contains about 150 inhabitants devoted to the usual avocations for the local inhabitant of a town of that size in a farming community.

Ten miles further on toward Virginia City is

The Town of Sheridan.

This is built on Mill Creek, a fine mountain stream, and the site of one of the first flouring mills ever built in Montana. There is another flouring mill here now called the Silver Spring mill, four miles from the town on Ruby creek.

There was a smelter built here some three years ago by a Philadelphia company. Mr.

F. J. Jones, manager and general superintendent, whom I called on, and that the company was, at the time the works were put up, short of means. This was the reason that they have never done anything, but that this spring the works were to be started up, without doubt, as more capital had been put in, and that from developments that have already been made in the vicinity, there is no doubt that they would have all they could do, and such being the case, cannot fail to be profitable, as they have everything at their command and cheap to work with.

Mr. J. M. Johnson, formerly interested with N. Armstrong in merchandise at Glendale, is developing a mine up in the mountains, a few miles from Sheridan, and he assured me that the district was a promising one. He has 200 tons of \$100 ore on the dump at his mine, and not being a man given to extravagant statements I have no doubt that it is a correct estimate. From Sheridan it is nine miles to Laurin, another postoffice and store, just below the junction of Alder gulch with Ruby. Perhaps it may be well to say for the benefit of old Montanans who may read this article that Ruby creek in former years was called "Stinking Water." The town does not make many pretensions beyond a country cross-roads. Soon after leaving Laurin I came to

Alder Gulch.

And the evidences of the tolling placer miner loomed up. This old gulch was almost without a parallel in the annals of placer mining, and as to volume there is no question about her standing far in advance of any placer in Montana. The yield to the beginning of the present year was between \$70,000,000 and \$75,000,000—a large sum for one gulch to produce; would that there were more of them. Nearly this whole sum has been from the placer mines, and there are yet 13 bedrock flume companies operating, working the ground over a second time and realizing handsome returns.

L. A. Fenner, of Nevada, two miles below Virginia, showed me a pit 100 feet square, which yielded \$4000, for working over and requiring a little over 400 days' labor. That is a good property, as wages at \$3.50 per day, leaves the proprietor a handsome dividend for his labor.

These flume companies probably average \$25,000 per season, as one of them last season cleaned up over \$50,000. Mr. Fenner, who by the way, is quite an inventive genius, has a machine in operation on his claim to gather the coarse rock and gravel from the flume and thus save filling up his dump (which is very limited), carrying out the old adage that "necessity is the mother of invention." I think it will no doubt be patented and used by many others similarly situated. It works to a charm and does the work that five men would do with forks, and it is cheaply constructed and easily operated by a small stream of water on a 12-foot overshot wheel. It gathers a load of rock and gravel and is then thrown in gear and turned over into a car. This, when full, is run out and dumped automatically by the same power that lifts the separator away from the flume with its load of gravel, and is easily operated by a boy. He ran it for three weeks before the season closed this last year without a stoppage for repairs or breakage, making it a very satisfactory test for a new machine.

Mr. Fenner is one of the old stand-bys of Alder gulch, having come in with the first stampede in 1863 and has made his home here ever since, following the uncertainties of a gold placer miner's life with the usual varied success that attends it. He has a large amount of ground ahead of him, enough to last him the term of a natural lifetime.

The quartz interests in and around Virginia have been the Waterloo of many companies and individuals, and with very few exceptions they have been disastrous failures financially speaking. The old Kearsarge in the Summit district is about the only one that any money was made out of. Colonel Postelwaite in a very short time cleared \$70,000, and then the ore became base and with their then improved appliances they were unable to work the ore to a profit. It was finally shut down and in the course of time the mill was dismantled and it was unthought of for a long term of years. It has lately been relocated by Messrs. Hyde & Barber and shows up a fine body of low-grade ore nearly 20 feet wide and prospects from \$6 to \$25 per ton. They have opened at a new point with an open cut and are satisfied that they have a good property.

The Bell Mine

Is in the old Fairweather mining district, two miles south of Virginia, and is owned by L. B. Bell, E. Carman, M. Bolinger and D. A. Thornton, and known as the Bell Mining Company. They have the best developed lead in this vicinity, having three long tunnels run in on the lead and numerous crosscuts and levels run to further satisfy them of the stability of their property. The upper tunnel is in nearly 400 feet and runs on the ledge for nearly 300 feet. A number of crosscuts run at different points from wall to wall show a ledge from 12 to 16 feet wide. Ore sent to Salt Lake and treated from this tunnel averaged \$28 per ton.

The lower tunnel is in 720 feet; about 400 feet of this distance is on a continuous chute of ore, assays showing from \$12 to \$125 per ton, and crosscuts run in a number of places show the ledge to be widening as they go down on it, the width averaging from 20 to 26 feet. The ledge has also been opened at a number of

other points, and wherever they have touched it they found good prospects.

It is a contact vein having a lime foot-wall and granite hanging-wall. The mine was originally discovered by Mr. L. B. Bell, and the other parties became owners of one-half by paying him some \$1500, and doing a large amount of developing. From the amount of tunnels, and levels, and crosscuts that have been run on the property, I think they have religiously kept their contract, yet it is the subject matter of a long litigation between themselves and Mr. Bell, and until that matter is settled the property will no doubt be a non-producer, which for the prosperity of Madison county, and Virginia City in particular, is a hard blow. They have been to work on this lead for seven or eight years, and should they ever get their legal differences settled, it will no doubt be heard of in mining circles more extensively. Six years ago a quantity of ore was taken at the grass roots and milled in Platter's mill, returning 40 ounces silver and \$35 gold; this in connection with many other tests make it a reasonable proposition that the property is a good one.

The Way-Up

Is owned by Messrs. A. M. Hart, J. S. Snyder and G. W. Smith. It is in the same ridge and has the same character of ore as the Bell. Has three shafts; one down 35 feet, another 90 feet, and another 80 feet. Some stoping was done some years ago in the 90-foot shaft, and considerable bullion was taken out. Some shipped to the Colorado smelter at Butte returned \$72 per ton. This is another immense lead and when a plant is once placed where they can get their ore worked without paying the whole product out for freight and reduction, it will yield its owners a handsome competence. They are now running a tunnel to strike the lead at 300 feet in depth; this is now in 380 feet and they expect to strike the lead at 70 feet further. Should it prove as good at that depth, they will feel assured of the permanency of their mine.

The Alameda mine is located two miles from Virginia, between Alder and Brown's gulch, and is now the only property that is equipped for the reduction of ore. This property was purchased a few months ago from Thomas Deyarmon and Thexton by the New York and Montana Mining and Milling Co. for \$30,000. They at once commenced work in a systematic manner to develop a property; there was a tunnel in some 400 feet, and they now have a shaft down a considerable distance; have a steam hoist and an air compressor, and although their lead is very small, they are keeping their mill running. They have a characteristic that is common with nearly all Eastern companies. That is of not allowing visitors. Their plant consists of a rock breaker, five stamps and one of Sturtevant's ore pulverizers. Messrs. Frazer and Chaluners, are sending out one of their experts to instruct them how to operate the pulverizer, as it has not met with expectations so far. They are provided with a White improved cylindrical roaster, and the usual equipments of pans and settlers, making it a complete plant for this section, and will no doubt be the means of attracting others.

The Prospect mine, one mile north of Alameda, owned by G. W. Layton & Rice of the Butte Hardware Company, is a large and finely developed property. The lower tunnel is in 600 feet on a continuous ore body, from six feet to 15 feet in width. A portion of this prospects very high and has the appearance of making a good paying property. During my visit this mine was visited by an expert from New York for some parties, but as I have not seen any record of a sale being made I presume they failed to agree. The price asked was \$150,000. They have a large quantity of low grade ore, which might be concentrated to advantage and this, in connection with a small body of very high grade ore, ought to make it one of the finest properties of the district. A sample taken by a disinterested party and sent to the Ontario, Utah, for a test, made a return of 85 cents per pound.

Brown's Gulch district, five miles south of town has some very promising properties. Some years ago, two mill properties were erected here, but the imperfect machinery here brought about the usual results, and enough could not be saved to make the properties pay. They lay idle for years, until within the last four or five years more or less prospecting has been done, and some ore shipped that yielded satisfactorily.

Vanderheck and McAdams have a prospect called the Ovid, and have a tunnel in some 60 feet, with about 3 feet of ore in sight that assays from \$40 to \$50 per ton.

The Comet and Sonora.

The Comet owned by the same parties is on the west side of Brown's gulch; is opened up in a number of places and shows 3 feet of ore, a portion of which prospects very rich. They have 200 tons on the dump, that from a number of average assays have returned \$50. Their lower tunnel is in 125 feet all in good ore and they also have the mine open at the extreme north end. It also looks well there.

The Sonora, owned by J. M. McAdams, is pretty well developed. Some of the ore has been worked with arrastras and the last nine tons worked yielded over \$800; averaging over \$90 per ton. The lowest average by working in the arrastra returned \$30 per ton. This property has a number of shafts down, the deepest being 125 feet and from these a number of levels

have been run; the appearance of the ore in each opening being about the same—the ledge averaging 3½ feet in width. There are a number of other properties here with more or less development, and each owner is sanguine that he has a mine that will sooner or later yield him a fortune. Two miles further up Brown's gulch are some of the finest properties in the vicinity of Virginia.

One, the Sprat, is owned by Thomas & McRoberts. Their lower tunnel taps the lead at 60 feet in depth; have run levels each way and have crosscut the lead. They have a fine body of ore in the other tunnel, and have run levels each way; on one side 40 feet on the other 250 feet. A three-ton sample sent to Salt Lake for treatment returned \$76 per ton. In many places their assays have run up to near \$200 per ton. Many years ago a shaft was sunk on this lead and the ore milled in the old John Howe mill and returned \$38 per ton, but the ore is full of iron pyrites and to save all the precious metals in it will require well equipped reduction works.

(To be Continued.)

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SAW-SETTING DEVICE.—Daniel Behmer, Santa Rosa, No. 336,201. Dated Feb. 16, 1886. This relates to that class of saw-sets in which an adjustable rest is provided for the saw-blade, and an adjustable gauge defines the position of the teeth under the hammer; and the invention consists in the manner of mounting the rest, and fixing it whenever adjusted, in the means for adjusting and holding said rest at any desired angle, and in the construction and means for adjusting the tooth-limiting gauge.

IRON BEDSTEAD.—Andrew L. Pringle, S. F., No. 337,519. Dated March 9, 1886. The invention consists in the novel construction by which the union or joint at the corners of the headstead is made. The object is to simplify the construction of the headstead, and at the same time strengthen it and lessen the cost. Further objects are cleanliness and safety, the latter being of importance by reason of the nature of the use of such bedsteads, they being employed in insane asylums where the cunning of the occupant may lead him to take the bedstead to pieces, provided this can easily be done.

AGRICULTURAL IMPLEMENT.—John D. Scott, Petaluma, No. 337,525. Dated March 9, 1886. This is an implement for cultivating the ground, and is used more especially for planting potatoes and similar articles. It consists of a frame having peculiarly adjustable cutters or teeth, a vehicle mounted upon wheels, and a means for suspending the frame with its teeth from said vehicle so that it may be raised or lowered at will, and a mechanism by which the draft is applied both to the vehicle and the cultivator, together with a device for planting the potatoes, and a means for indicating the distance between the hills.

ROLLER CULTIVATOR.—John Clay, Camptonville, Yuba county, No. 337,480. Dated March 9, 1886. This roller cultivator consists in a rolling frame or cylindrical core, having hinged to its periphery a number of independent sections, preferably these, each section comprising a number of parallel bars hinged to each other and provided with teeth. As the cultivator rolls along, each section as it passes its center of gravity, drops forward away from its seat upon the periphery of the core and falls flat upon the ground, its teeth breaking the clods, and the core, advancing, rolls over the fallen section, pulverizing the broken clods and winding up the section behind it, while a second section is being dropped down. The blows received from the falling sections cause the soil to break and pulverize in a most thorough manner, reducing the clods to fine soil.

CUT-OFF VALVE.—John P. Simmons, S. F., No. 337,025. Dated March 2, 1886. This invention relates to certain improvements in valves for engines, and it is especially applicable to valves, such as are shown in his patent of September, 1884, and illustrated in the PRESS on page 141, February 27, 1886. It consists of a tapering main valve with a cut-off of the same shape inside of it, having an inlet upon one side of the casing, within which it oscillates, and steam and exhaust ports on the opposite side. These valves are closed at both ends, and have trunnions at the larger ends, and valve stems extending outward from the smaller end, and cranks or eccentrics by which they are operated. In combination with these Mr. Simmons employs a packing to provide a steam tight joint between the neck of the inlet passages and the main valve, and prevent the unseating of the valves by allowing steam to pass through openings in the trunnions into a recess at the ends, this pressure being sufficient to prevent the valves leaving their seats on account of the taper.

AN ox was recently killed near Eureka, Humboldt county, and in its stomach was found over a half a pound of two-penny finishing nails. They were worn smooth and bright by the action of the acids of the stomach.

MECHANICAL PROGRESS.

The Defective Steel Plate Problem.

We have alluded in these columns to the repeated reports of strange failures of Bessemer steel plates in the English marine service. British steel makers have become greatly interested in investigations as to the cause of such failures. At first these investigations were so unsatisfactory that certain steel and metal ship building circles were quite unnerved at the new danger presented. Quite recently, however, there seems to have been a ray of light thrown upon the matter, which gives encouragement to hope that the cause of the trouble has been brought to light, and that the danger will be avoided in the future production of such plates. Evidence is accumulating, according to the report of Mr. Stromeyer, one of the investigators, that in nearly all cases in which mild steel plates have been found to fail in an unaccountable manner the plates have been subjected to bonding or hammering while hot, and that there can be little doubt that while they were being worked these plates were at a blue heat, or as smiths and boiler makers term it, a black heat. By the expression "blue heat," Mr. Stromeyer, as we gather from the correspondence of the *American Manufacturer*, includes all temperatures which produce discolorations ranging from light straw to blue.

Injurious Effect of Blue Heat on Steel Plates.

Such treatment, Mr. Stromeyer reminds engineers, is the most injurious to which steel can possibly be subjected, and he remarks that although similar failures occur in iron plates, yet the metal being less ductile than steel, the failures are not so glaring. He would not, however, have it supposed that all failures are due to this cause. He, like many other engineers, is acquainted with instances in which plates of both iron and steel have failed without this treatment, although with the usual tests the quality of the material was good. Three hundred and sixty experiments have been made by Mr. Stromeyer, and they have consisted mainly of bending and of tension tests. It appeared from these experiments that the limit of elasticity of both iron and steel was raised by repeated testing. A test piece shortened when cold showed a reduction of the elastic limit; but another piece shortened when hot showed an increase.

Loss of Ductility With Blue Hot Steel.

Steel which had been bent cold, either once or twice, would stand almost as many subsequent bends as the original test piece. But if the same material was bent once while blue hot, it lost a great deal of its ductility.

Out of 12 samples, in which two preliminary hot bends were made, nine broke with a single blow of a hammer, and the other three only stood one or two subsequent bends. Thin Low-moor iron did not break quite so easily, but supported about one-half the original number of bends.

The Difference Between Good Iron and Mild Steel.

Seemed to be that iron broke more readily than steel while being bent; that iron suffered more permanent injury than steel by cold working, but that if it had successfully withstood bending when hot, there was little probability of its flying to pieces when cold like mild steel. It was said to be a common practice amongst boiler makers to "take the chill out of a plate" if it required a little setting, or to set a flanged plate before it was cold. This was nothing else than working it blue hot. All hammering or bending of iron and steel should be avoided, unless they were either cold or red hot. Where this was impossible, and where the plate or bar had not broken while blue hot, it should be subsequently annealed. Boiler makers are now

Guarding Against Failure

By the cessation of work as soon as a plate, which had been red hot, became so cool that the mark produced by rubbing a hammer handle or other piece of wood over it would not glow. A plate which was not hot enough to produce this effect, yet too hot to be touched by hand, was most probably blue hot, and should, under no circumstances, be hammered or bent.

Further Investigation Desired.

It was almost a work of supererogation for Mr. Stromeyer to suggest that the question should be further investigated, and that steel masters should endeavor to ascertain whether every quality of steel was made permanently brittle by being worked at a blue heat. There can be no question that further investigations will take place and that some important results may be expected. By reason of this danger mild steel is rapidly coming into favor and taking the place of basic and Bessemer metal among English iron workers.

NAILS FROM OLD STEEL RAILS.—A Pittsburgh daily reports Mr. Bernard Luth as speaking as follows concerning his process for making nails out of old steel rails: "It is now entirely controlled by a syndicate of capitalists, of which General Beaver is at the head. They will, I understand, only sell the right to seven or eight firms in the United States, one on the Pacific Coast, one at Chicago, one in Ohio, the one at

ready established in Pennsylvania, at Bellefonte, and one or two more. Their idea, I believe, is not to have them conflict with each other's business. The mill at Bellefonte is now running on the new plan and from one pair of rolls turns out 30 tons per day of nail sheet from three-foot rails. Since it was introduced I have made an improvement by which nails can be run six feet in length, thus doubling the amount turned out, without any additional working force. By it the cost of making steel nails can be reduced about 20 per cent. The use of steel nails is growing very fast, and I believe that in a year from now very few iron nail mills will be running."

Improvements in Wrought-Iron and Steel Castings.

One of the great difficulties in making castings from steel is to get a product which is solid, sound, homogeneous, or free from blisters or cavities. The addition of ferro-manganese and other compounds containing carbon, silicon and manganese makes the product somewhat more solid, but deteriorates the quality in other respects, as the product gets harder and more brittle or red short. It has been impossible to make castings of wrought-iron or mild steel at the same time solid and retaining their qualities and their strength.

It has, however, recently been discovered that either wrought-iron or mild steel castings may be obtained solid and free from blisters or cavities, and that, too, without changing the peculiar qualities of either metal, by simply adding about one per cent of aluminium. The addition is made after the iron or steel has been melted, and preferably just before the pouring is commenced. The melting point of aluminium is about 500° F., and the effect of its introduction is to lower the melting point of the mixture, and thereby render it more fluid, so that the gases in the metal pass away easily, the metal runs freely into the mold and a more perfect product is obtained. No fluxes whatever are used. A very minute quantity of aluminium, even less than one per cent, is said to have the desired influence.

Perfect castings of considerable ductility and great tensile strength have thus been made from the softest wrought-iron. The iron or steel is melted in crucibles, converters, or metal smelting furnaces of any description. It is convenient to provide a plug in the cover of the crucible, which is removed when the metal is completely melted, a tube is inserted into the aperture, and the aluminium to be added is passed down the tube. The tube is removed and the plug replaced, and the metal is soon ready for pouring.

According to the *Scientific American* Mr. Nordenfelt, the inventor of the well-known machines is the discoverer of the process. Other writers say that the invention has been made and patented by C. G. Wittenstrom, of Stockholm, Sweden.

Welding Iron and Steel.

A series of experiments were undertaken by Prof. J. Bauschinger at an instance of an engineering firm. Similar experiments had been previously made at the Royal Mechanical Technical Experimental Institute, at Berlin, and by W. Hupfeld, at Prevali, very favorable, as regards the welding capacity of steel. Professor Bauschinger recapitulates the main results of these tests before describing those made by himself. The materials used in the latter were steel, from the Peine Iron Works, at Hanover, and bar iron of various sections from the Neue-Hoffnungshutte, near Herbauer, in Nassau. The test pieces were flat, square and round in section, the largest being 3.149 by 1.181 inches. Each piece was cut in two, cold, swelled up on the anvil, when hot, 0.196 to 0.392 inch, and after heating to the proper degree, the two portions were laid on each other and welded together by hand or steam hammer. Some preliminary studies were made in the laboratory of the college to ascertain the best method of welding and the best flux for steel; quartz sand answered the latter purpose, while it was found that a rather less degree of heat was required for steel than for wrought iron; a pure coal fire was used.

In the chief experiments the steam hammer was employed. Every piece after welding was tested in the usual way for tensile strength, the limit of elasticity, contraction, extension and ultimate strength being determined, the same quantities having been measured for pieces of exactly similar quality, section and length, but without a weld. Both for steel and iron the limit of elasticity is nearly always reduced by welding, and this is, without exception, the case as regards the extension; the contraction of welded is less than that of unwelded pieces when the fracture takes place in the unwelded portion. The general conclusions arrived at are that for steel the best welding temperature is just at the transition from a red to a white heat; a quick fire and smart handling are necessary, as the pieces should not be long in the fire.

Analyses were made of three samples, one of which welded admirably, the second badly and the third not at all. Professor Bauschinger is of opinion that in the case of mild steels, such as those tested, with a low carbon, intended to take the place of bar iron, success or otherwise in welding depends less on the chemical composition than on the mechanical treatment.—*Boston Journal of Commerce*.

SCIENTIFIC PROGRESS.

The Latest Triumph of Science.

The world moves; wonder follows wonder, and each seems more wonderful than its predecessor. The latest triumph of science is carrying on telegraphic communication from a railroad train running at a high rate of speed. The Railway Telegraph and Telephone Co. recently gave an exhibition on the Staten Island Railway of the new method of sending and receiving telegraphic messages on a railway train under full headway. Among those on the train were Senator Leland Stanford, of California; vice-president Sykes, of the Chicago & Northwestern Railroad; David Dow, vice-president of the Rock Island Railroad; Stuyvesant Fish, vice-president of the Illinois Central, and Thomas Edison. A battery was in one of the passenger cars, with a ground wire connecting with the axle of wheels and the track. The other wire connected with the tin roofs of the cars, which in turn were connected by an insulated wire. The common electric magnet worked by a Morse key was used. From the car roofs the messages were transmitted by induction to the permanent wires on the poles along the line of the railway, a distance of from 25 to 35 feet. Messages were sent to and from New York and other points with perfect facility while the train was running at 30 miles an hour. Mr. Edison said the new wonder in telegraphy would be introduced at once on the Illinois Central Railroad. The messages jumped mysteriously from the tin roof of the cars to the ordinary wire strung along the poles; and this service did not interfere with the use of the wires for regular messages at the same time. One of the persons present asked Edison to explain this latest freak of his ingenuity. "It is difficult," he said. "It takes 1000 different electrical discharges from the roof of this car to that wire to send a single word. A single dot is made up, say of 100 atmospheric waves. These are sent separately. From the Morse battery the waves go at the rate of 20 to a second; here at the rate of 600 to 1000 to a second. The electrical communication lasts only about one 250,000ths of a second. Can you understand that? Very well, then. I see you do. To keep the air from being polarized we have to plump the words through quick. I can send a message 550 feet in this way through the air. The current does not go from the battery but from the magnet. This electricity differs from the ordinary electricity about as a fall five miles high would differ from a fall a foot high. It is under very high pressure."

The Progress of Science.

The president of the British Society of Engineers, Mr. P. F. Nurse, in his recent inaugural address said: "The facts I have brought before you also point to the moral and material progress of the world. 'The bee that hummed his busy hour through the bowers of Paradise,' wrote Sidney Smith, 'fashioned its hexagon with the same mathematical precision which it does now and here. Six thousand years have added nothing to the sagacity of this horse or the intelligence of the dog.' But how widely different with man! He commences as a first-worshipper and rises to a Newton, a Faraday, a Stephenson, a Siemens. He tempts the river in a few fragments of bark lashed together with thongs of rawhide, and crosses the Atlantic in an iron steamer of 22,500 tons burden (the *Great Eastern*). He burrows in the earth and then builds a city with 4,500,000 inhabitants. He sticks a dried reed in a lump of fat to light his mud hut, and carbonizes 2,200,650 tons of coal per annum to illuminate London. He takes weeks to send messages on sticks to Montezuma, from the coast, and at last reports in London the details of a battle fought in the Soudan the same morning. He slays his foe with a sling and a pebble chosen from the brook, and meets the enemy with a machine gun firing 600 rounds a minute by means of its own recoil (the Maxim gun). He lays siege to a city with a balista, throwing a fragment of rock, and finally attacks a fort with a gun weighing 110 tons, projecting a steel shell of 1800 pounds, with a charge of 906 pounds of gunpowder. The ax-head that floated for a few seconds on the Jordan 3000 years ago, when the 'iron did swim,' was a miracle indeed. These are the beginnings and endings of science, but they are the endings of science as regards the present only. They are by no means final, as science never stands still. They are but the landmarks of our times, which, as Emerson puts it, are 'trivial to the dull; tokens of noble and majestic agents to the wise; the receptacle in which the past leaves its history; the quarry out of which the genius of to-day is building up the future.'"

THE PHENOMENA OF TORNADOES, to the scientific study of which Lieut. John P. Finley, of the United States Signal Corps, has devoted about eight years, are now so well understood as to warrant the belief that trustworthy warnings may soon be sent out to the inhabitants of localities which may be threatened with disastrous visitations. Daily predictions are, in fact, being made, having begun last year and continued through the tornado season and resumed recently upon the return of Lieutenant Finley from an inspection tour through the West. The

percentage of verifications is already gratifying, though the predictions are as yet largely experimental and are embodied in the daily published bulletins of the signal office only when the conditions are favorable to the creation of the tornadoes they are very pronounced. In such cases "severe local storms" are noted as probable.

The Moon and Photography.

A contemporary philosophizes upon the interesting possibilities in regard to future astronomical discoveries by means of photography, substantially as follows: Photography differs from all other pictures in being an absolutely faithful reproduction of everything within its range. The piercing rays of the sun are absolutely impartial reflecting the exact apparent form and size of everything within range of the camera. This evident fact suggests an interesting thought. If the sensitive plate could be made of such exceeding fine quality as to print accurately the smallest objects conveyed to it by the rays of light, the simple process of magnifying it would enable us to print copies so large that it would be equivalent to multiplying many times the power of the largest telescope. The present limit to the magnifying power of telescopes is the obscurity of the glass which has to be very thick in high powers; but if the magnified object is photographed, and the photograph is of fine enough quality to be itself magnified what wondrous results might not be obtained! An object on the moon the size of a small hill can be plainly seen now; with this improvement the houses and people (if there were any) could be plainly seen. The mysteries of Mars' varied surface, the belts of Jupiter and the extraordinary rings of Saturn, we may hope, will be understood in the near future—a future bright with the scintillations of man's genius which is fairly overturning the world and bringing us into closer harmony with the infinite universe, and fairly opening our ears to the "music of the spheres."

How Rain is Produced.

Did it ever occur to the reader that there is just as much water in the air above on a clear, bright day as on a cloudy or rainy one? Rain does not come from somewhere else, or if it is wafted over you by the wind from elsewhere, the water that was over you is simply wafted on to some other place. Water is absorbed in the air above us, at a certain temperature, and it becomes insensible. Cool that air by a wind draft of cooler atmosphere, or by electrical or chemical influences, and the moment the air becomes cooler it gives up some of the watery particles that were insensible or invisible at the higher temperature. These small particles thus given out unite, and when enough of them coalesce, obstruct the light and show as clouds. When enough of them unite to be too heavy to float in the air, they begin to descend; pair after pair of them come together until a rain-drop is formed. One of these minute rain-drops is made up of millions of infinitely small watery particles.

Air passing over the cold tops of mountains is cooled down so that it gives up a good deal of the congealed watery vapor, and hence little rain falls in the region along the lee side of such mountains. This is why so little rain falls in Colorado, and in other places north and south of that State. The prevailing winds blow from the west, and at the cool tops of the Rocky mountains lower their temperature and thus take out the moisture that would otherwise fall in rain.

SCOURING ACTION OF WATER.—Responding to an inquiry as to the base taken by engineers in calculations of the carrying power of water to determine the scouring action of a river on its bottom, the *Manufacturer and Builder* says: "The carrying or transporting power of water increases as the sixth power of the velocity—a prodigious rate of increase, as may be inferred from the fact that a stream having a velocity six times as great as another, will be able to transport material weighing 46,656 times as much as that carried by the slower stream. The data from which engineers commonly calculate the effect of a scour on a river bottom are about as follows: A stream flowing with a velocity of 3 inches per second barely produces an effect on fine clay; 6 inches per second will raise fine sand; 8 inches per second will raise sand of the coarseness of linseed; 12 inches per second will sweep along fine gravel; 24 inches per second (or 1½ miles per hour) will carry pebbles of about 1 inch in diameter; 36 inches per second (which is about 2 miles per hour, or about two-thirds the rate of speed of a moderate walk) will sweep along fragments the size of an egg."

NOISELESS ANVILS.—If it is desirable to set up an anvil so that its use will make the least possible noise, set the anvil on a block of lead; or make a putty ledge around the anvil upon the wooden block, one-half inch clear all round, one inch high. Raise the anvil clear of the block one-half an inch, by any means available, pour in the lead until it rises above the bottom of the anvil; or set the anvil on a good bed of sand held in a box.

THE EGYPTIAN chariots had line-bolts of bronze and were put together with pins and nails. Screws so far as known were not invented.

Passing Events.

News again comes from the northwest coast of gold placers having been discovered. Thus far we have only vague reports on which to rely, but as a number of men have gone to the new fields we are well soon learn definitely as to their extent and richness.

The discovery of petroleum in New Mexico is attracting considerable attention, and there is quite an excitement around Albuquerque.

In several places in this State boring is going on in the hope of striking flows of natural gas. In one or two places it has been found, and in others the prospectors are very hopeful of good results.

The manufacture of the first steel armor plate ever made on this coast marks a step in advance in our mechanical industries, and one which may be fruitful of great results.

Work in the Big Bend tunnel, says the Chico Chronicle, is being pushed as rapidly as possible and the big cut will be completed about the 7th of April. There are only about 250 feet to tunnel. Feather river will not be turned into the tunnel until about the 1st of June, as two immense gates and some dams are to be constructed. It is not likely that a demonstration will be made at the tunnel until June.

PHILIP DEIDESHEIMER, well known on the Comstock, is not the Deidesheimer, who, as secretary of a California mining company, is reported as having taken a lot of gold bullion belonging to the company.

Smelting Capacity of Furnaces.

The water-jacket furnaces in use on this coast are generally round but some are oblong, and generally they have uniformly sloping sides. The quantity of ore a jacket of given size will smelt depends upon the fusibility of the charge, the strength of the blast and the supply of water. The three-foot round jacket is usually designated a 30-ton furnace. Under exceptionally disadvantageous circumstances, a furnace of that size will smelt only 20 tons; but with fair ore and good management, as at the Copper Queen, Arizona, and elsewhere, it smelts 45 to 50 tons a day. On the very fusible ore of the Old Globe mine, at Globe, Arizona, as much as 56 tons a day have been put through a three-foot furnace, and even this quantity has been exceeded by a furnace at the Verde.

Unless the ore is refractory, Mr. James Douglas, Jr. considers that 45 tons of mixture should be smelted under a blast of 10 to 12 ounces, produced by 100 to 115 revolutions of a No. 4½ Baker blower, provided the supply of water is ample. The latter condition is essential. To keep a three-foot furnace cool under a high blast from 37,000 to 40,000 gallons of cool water must be passed through the jacket daily under a head of not less than 10 feet.

Round furnaces of a greater diameter than three feet, if the ore is favorable, will smelt more than smaller ones, though not generally in proportion to their area. Oblong furnaces, whose shorter diameter does not exceed three feet, come nearer to the duty of the small round furnace, area for area, than do large round furnaces. If the ore is not free smelting, a furnace of greater diameter than three feet is very liable to become deranged with the formation of a core. If, however, the mixture is fusible, and does not contain much fine ore, the blast of a blower of No. 4½ will penetrate to the center of a four-foot furnace, though a No. 6 is preferable where furnaces of that size are used.

The advantage of a small furnace over a large one is that it is more manageable, and if it becomes hopelessly deranged it can be blown out with less cost than a large one. On the other hand, the record of the Detroit large rectangular furnace, according to Mr. Douglas, shows a slight saving in fuel over the small furnaces, though this is not the case with the large round furnace of the Arizona Copper Company. Up to a certain point the staff necessary to handle the charges and slag of a small furnace would handle a somewhat larger quantity. There is therefore always an economy in this item, but unless the ore is very fusible and invariable in its contents this advantage is more than balanced by liability to derangement.

Steel Vessels.

The Union Iron Works of this city, in order to demonstrate their ability to build armored vessels on this coast, have prepared a steel ingot weighing 17,000 pounds, which, fashioned into a plate will be sent to Washington, in order that the Secretary of the Navy may test it with heavy shot. The plate is ten feet long, three feet wide and ten inches thick. This week the delegation of Congressmen who came to the city as escorts to the body of the late U. S. Senator Miller, visited the Union Iron Works and Pacific Rolling Mills, so that they would see for themselves the extent of their plants, and judge of the capacity of the works.

The boiler shop, machine shop, foundry, and all the departments were inspected with no little interest and the party then proceeded to the rolling mills. Ten tons of steel had been prepared, and at 12 o'clock the signal was given and it poured out from the immense receptacles, over the furnaces, into a ladle swung from a derrick. The metal was then run into molds, and the various processes were thoroughly explained by Mr. Scott and Mr. Benchley. The facilities for building and launching of vessels were examined to the satisfaction of the visitors. One vessel for the Government is now under way at the shipyard of the Union works. She is being built of steel and will take the place of the steamer General McPherson in use on this bay, plying between the different islands and points where there are fortifications or barracks. It is to be hoped that if the Government builds a cruiser for this coast, as is the intention, that the work be given to contractors here, as we are as well able to build it as all other centers of iron industries.

California Laboring Classes.

An Eastern correspondent asks us a few questions about the California laboring classes, which can be answered briefly, as follows:

It is pretty well acknowledged that even taking into consideration the slightly higher cost of living, the wage-earners of California have decidedly the advantage of their Eastern brethren, not only in the amount of pay received, but in other ways as well. This is in a comparative sense, of course, since in some branches the pay is better elsewhere. There is one thing, however, the mechanic or laborer here in this State lives far better than those of his class East. Even in this city there are no houses like the "tenements" of the East. Nearly every family has a house to itself, and few have less than three rooms, and rents are not excessive. The mild climate admits of people enjoying life all the year round, and stoves are mainly useful for cooking. The houses do not have to be built expensively to guard against severe cold in winter, and temperate, industrious men have less difficulty here than elsewhere in becoming the owners of a home.

The necessities of life can be had here cheaply. Flour, beans, potatoes, fruits, fish, tea, coffee, rice, etc., are very cheap, though the prices are higher for groceries, meats and vegetables. The vegetables ought to be a great deal cheaper than they are, as they are easily raised.

Clothing, too, is not as cheap as it should be, though costing less now than was the case a few years since. We raise plenty of wool, but it is all sent East and made into clothes, which are sent back here and sold. Amusements are here in abundance, and as Sunday in this State is recognized largely by the working classes as a day of recreation, as well as rest, they go into the open air and to various pleasant resorts within reach of the cities. It is not found necessary in this State, to as large an extent as elsewhere, to make the children of the family work in factories, mills, etc., to add to the earnings of the bread-winner. The average parent is unwilling that his children should work if he can help it, and the children of the mechanics and other wage workers accordingly attend the schools for years longer than in older communities.

Compared with Eastern cities, we have had very little difficulty from "labor troubles" in California, the main complaint from the laboring classes having been the presence of Chinese in the communities, who work for very low wages. In some branches these people have driven the white laborers out, and the present agitation is the direct result. When this subject is favorably settled, the wage worker in California will have very little, if any cause of complaint, and can congratulate himself on his place of residence.

Fineness of Grinding in the Patio Process.

The Mexicans, in grinding ore in an arastra, when it contains gold alone, find that it is not profitable to grind it finer than a certain point, but silver ore is ground much finer, especially where there are sulphurets. They get a higher percentage by grinding the sulphurets fine, since in the subsequent operation on the patio, turning them over and over, causes more rapid oxidation by presenting new surfaces. A charge is ground from 12 to 72 hours, according to the class of ore. In many places they grind for only 10 hours, but it is usually got into a state of slime before being put on the patio.

Mr. E. C. Van Blarcom, who examined the details of the patio process while at Guanaguato, took some of the pulp from the patio for the purpose of seeing how fine it had been ground by the arastras. It was dried and then screened. The result was that 97.15 per cent passed through a 100-mesh screen, 1.44 per cent through a 60-mesh screen, and the residue was 21, making 98.50, the loss being due to imperfect drying of the sample. This very fine grinding had been done in 36 hours by the arastra. The ore was worked for gold and silver.

THE Cedar Mountain chrome mines, near Livermore, are shipping quantities of chrome ore to Philadelphia by rail, owing to low rates of freight. About 30 tons a day are hauled to the railroad station.

LARGE quantities of redwood are being shipped from Humboldt county to Australia.

Mills on the Carson River.

A Grand Revolution in Milling Ore.

[Written for Press by J. B. P.]

The greatest advantages are frequently derived from the simplest agencies at command. The use of hydraulic power in working pumps on the Consolidated Union is a fair illustration of this. No other power could well take its place; it meets the demand with a simple, unmodified element—water, and brings into play, with the least complication of machinery, 1500 pounds of power to the square inch. Such is the simplicity of mechanism employed to produce this result that in the opinion of the head foreman, Mr. Chas. Matheson, these pumps on the Norcross, located from two to three thousand feet below the surface, would still ply their work without interruption for days, even though they should be drowned in hundreds of feet of water, in case the mine should be accidentally flooded. Over 20 years since an idea was set afloat in Colorado that some new chemical preparation had been discovered whereby ores of the most stubborn and unrefractory nature could at once be dissolved, and the mineral be gleaned from the pulpy mass with the smallest amount of trouble and delay. Thus, the hammering and the pounding and the thundering of the old fashioned quartz mill would disappear forever. We watched and waited patiently for some further development in that direction, but as more than 20 years have now elapsed since the discovery was presumed to have been made, and we find nothing of the sort working to the relief of the miner about Leadville, Tombstone or the Comstock, we are much inclined to believe that the new discovery was prematurely announced, and that it shared largely in the aerial, akin to the theory of metal deposits by surface agencies, and therefore is an exploded thing of the past.

But as the hammering still goes on, it has appeared eminently desirable that some method, device, or plan should be brought to the front whereby the enormously expensive process of extracting the metal from the ore already crushed, might be obviated. Nothing having been accomplished for nearly 25 years in the direction of rock pounding, it did seem possible that something could be achieved, in saving the metal from the pulp, to a much greater extent than it has been done, and of curtailing the overwhelming expense involved in saving any metal at all. The simplest and cheapest part of the work, now, is the crushing of the rock, the after process to get at the metal, incurring, by far, the greater bulk of expense. Many ingenious contrivances have been put forth to meet this want, none of which, however, until very recently, seem to have materially altered the grade of expense. The animated contest that has been awakened recently, in respect to concentrators, and the sharp rivalry that has sprung up between the "Frue" and "Triumph" as advertised in the MINING AND SCIENTIFIC PRESS, shows the anxiety and eagerness of the several inventors to be counted ahead, in the points of economy and success in treating ores. The agent for the Frue was engaged in the work of setting up that pattern, as we entered the Santiago mill on the Carson river. We had the pleasure of discussing with him the various inventions of this order, as well as some of the peculiar advantages which the Frue is represented to possess above all others, but were unable to remain until his machine could be got in working order. Whilst we were in Gold Hill, on a second call at the Alta mine, we were shown a simple piece of mechanism by the chief engineer, Mr. Phillips, which struck us as a product of the inventive faculties of that gentleman, likely to work a total revolution in this department of mining. The agency used by him was simply water, the same instrument of power that enables the miner to get at the richly freighted ore on the 3200 foot winze of the Norcross. The simple and only instrument used by him was the common syphon. Mr. Phillips illustrated the principle of his invention by employing 100 well-made bullets, of an ordinary size, 50 composed of lead, and 50 of tin. These were dropped into the shorter arm of the syphon by a short side tube inserted near the open orifice. The lead bullets, without exception, immediately fell to the bottom of the tub of water, now being emptied by the syphon, and were caught in a basin, whilst the tin bullets were carried up

through the syphon and dropped into a vessel on the outside of the tub, which was receiving the water. The next step in his experiment was the sifting, with a spoon instrument, a quantity of crushed ore into a simple apparatus surrounding the shorter arm of the syphon, and a similar result followed, of a still more interesting and beautiful order. The metal went to the bottom of the tub and was caught in a sancer, whilst the sand and raff of every description went up through the syphon, and was deposited in a vessel receiving the water on the outside.

Of the eight different siftings of crushed ore that were experimented upon, the finest, or eighth, appeared to show up the test with the greatest perfection. But a few days elapsed after witnessing this experiment before we were at the "Brunswick" mill, on the Carson, where that polite and efficient officer, Mr. W. H. Armstrong, superintends the running of 56 stamps in that finely constructed plant. We had heard considerable about the new concentrator, called the Golden Gate, being introduced at the Brunswick mill whilst we were in Virginia City, and were anticipating some new departure from the old ruts of the past in regard to separating ores. Our surprise was complete and most gratifying, when, after glancing over the machine, we found the same element at work, viz., water, and the same principle involved, to wit, suction, as we had noticed but a few days previous in the experiment at the Alta mine. The method of separation at the Brunswick differs from that of Mr. Phillips only in one particular; the suction in the one case is wrought by a syphon, and in the other by an air pump. Only one of these machines was in use in the mill when we were present, but so successful had it proved that four more had been ordered and would be at work in a few days. These machines are so simple as hardly to require an extended explanation. What has been said in regard to the process of the syphon as an ore separator will apply here, only on a larger scale. A long extended and broad metallic plate, over which the newly crushed ore from the mill is passed in one direction by a jiggling process of the plate, whilst a sweeping current of water of thin dimensions is sent in the opposite, constitute the main features involved. The lighter material is lifted from near one end of the plate by suction lips and carried from the mill as dead waste, whilst over the edge of the opposite end of the plate the mineral is shucked into a large metallic bath ready to receive it. Mr. Armstrong grasped an iron ladle and thrusting it into the bath drew up a pound or two of this metal. The glittering display showed at once what was being done by the water process, without the aid or presence of that most costly article, quicksilver. Mr. Armstrong avers that 95% of the metal, or even more, is saved by him with this process, and in several instances the full assay value has been secured.

Mr. Mackey remarked, when witnessing the experiment of the syphon, that, had the discovery been made fifteen years sooner, he would have been saved more than a million of dollars in quicksilver alone. From the statement recently published, in connection with Prof. Rae's project on the Carson, that \$41,000,000 were now lying somewhere in the bed of that stream, as something of an approximation of what the quicksilver had carried off from the mills, we can in some measure estimate what a prodigious waste has gone on in all the quartz mills of this country during the past quarter of century. By this new process all free milling ore has found an exit, and relief from the crushing weight of expense heretofore involved in its reduction at the mills, and unquestionably the greatest benefit will accrue to mining men everywhere, especially in the lower graded ores. Whilst mill owners may not receive so large a share of all that comes from the ore, in custom work, yet the absence of that very costly article of quicksilver will vastly cheapen the process, and his profits will be as great as before, whilst the hard working miner will fairly be reimbursed for all his outlay of toil and expense.

The bullion shipment from the silver mills of Butte, Montana, for the month of February, 1885, amounted to \$306,540. For the same period this year the shipments were \$332,480—showing an increase of \$25,940.

The strike among coal miners at Liege, Belgium, has assumed large proportions.

Electric Power for Mines.

Sometime since we stated that it was the intention of Prof. Keith, of this city, to arrange plants in some parts of our mining regions, where water-power was to be had, so that by means of electricity the power could be utilized at a distance for operating machinery at the mines. Other things have occupied his attention, principally electric lighting, and the scheme has not been carried out in this State. We see, however, by the *Virginia Chronicle*, that a company called the "Comstock Dynamo Electric Light and Power Co.," has been organized in Nevada, and has secured a water right on the Truckee river, where a dynamo machine will be set up to transmit power for the purpose of illuminating the Sutro tunnel and the Comstock mines, and furnishing motive power for quartz mills to be erected convenient to large deposits of low grade ore.

A dynamo machine will be set up on the Truckee. The power will be furnished by a Lefel wheel, propelled by the full head of water in that stream with a 100-foot fall. The power will be transmitted over a copper wire one-quarter of an inch in diameter to a receiving dynamo. This receiver will be connected by belting with the cam shafts in the mill. It is claimed that only 20 per cent of the motive power of the turbine wheel will be lost in transmission. The actual cost of driving a 100-

Gas and Oil.

In many places in the State at this time prospecting operations are going on for natural gas and oil. At the great Brea rauchos, in Southern California, where we obtain most of our asphaltum, a company is spending considerable money in prospecting for oil, with good chances of success. At Livormore, Alameda county, and near Parissima, San Mateo county, wells are being sunk for oil. In Ventura and Los Angeles counties, where there are already many good wells vigorous prospecting is being carried on.

A company has been formed for prospecting for natural gas in Fresno county. The managers are now trying to secure the lease of lands for a term of years upon which to sink wells for the purpose of reaching a reservoir of natural gas believed to exist in one of the valleys, at a depth of some thousand feet below the surface. The capital stock of the corporation is fixed at \$10,000,000, and the enterprise is being prosecuted mainly by Eastern capital. Upon the favorable terms offered, the company is having no difficulty in securing leases in this county. The following large land owners have already executed leases: Dr. E. B. Perrin, Thos. E. Hughes, M. J. Church, J. R. White, J. G. James, P. D. Wiggiton, J. B. Campbell and others.

At Los Angeles they have been sinking a

SOLUTION TANK FOR THE COPPER CRYSTALS WITH SILVER.

stamp mill by this method, it is said, will not exceed \$200 per month. The cost of transportation of Comstock ores to the mills on the Carson river foots up nearly \$1000 per day.

By building mills adjacent to the mines this sum will be saved as well as the cost of handling the ore over three different times as at present. The projectors of the enterprise claim that ore assaying less than \$3 per ton can be worked at a profit by the cheap system of handling which they intend to introduce. The cost of the plant for this great enterprise will not exceed \$30,000. The company's plan includes the lighting of the city by electricity and the running of a line of street cars from Virginia to Gold Hill, to be propelled by an electric motor. The machinery for the plant has been ordered from Eastern manufacturers and is now in course of construction. The cost of laying the wire between the Truckee river and this point is estimated at \$200 per mile. The wire will be stretched as the crow flies, and will be only eighteen miles in length.

By crushing and concentrating their ores the Paradise Valley Mining Company are so able to reduce the bulk of the crushed rock that one ton contains metal to the value of nearly \$500. Thus they are able to send the concentrated material to the Selby works, California, for smelting. There are doubtless scores of mines in all parts of Nevada that could be made to pay were there facilities for cheap crushing and concentrating. Miners may themselves ascertain whether their ores will pay when so handled by crushing a given weight, concentrating it in a pan, and then obtaining an assay of a fair sample.—*Silver State*.

well in the yard of the United States hotel, and are down about 955 feet. The well was started for artesian water. The other day they struck a vein of brackish water—not a flow—with some gas. They lighted the gas, but it soon died out. It is the belief of the owners that by going deeper they will strike oil or gas in quantities, and work is still continued in this expectation.

Mining Accidents.

Private advices from Pinal, Arizona, report a fatal accident in the Silver King mine. Several tons of ore caved in, killing instantly a miner named Bauman. John Stanfield is expected to die at any moment, his back and both legs having been broken by a boulder weighing 600 pounds.

An accident occurred this week near Santa Maria, 25 miles from Groveland, on the Yosemite road, by which Luigi Defforari was killed and his brother Augustine had a leg and arm broken. They were ground-slucing and the bank caved down on them.

While at work shoveling at the mines in Pennsylvania district, Nevada, a slab of dirt fell from a shelf, striking Robert Husband on the head and arm. The arm was broken just below the elbow and he was slightly cut on the top of the head. He was brought to town, had his arm set, and is now doing well. On the same day, while employed fixing the mill, James Clark had his thumb mashed by a piece of iron falling on it.

Andy Sawyer, a miner working in the Conductor mine, at Gold Hill, N. M., lost his eyesight by the premature explosion of a blast.

On Friday of last week a miner named James Leary, employed in the Empire mine, Grass Valley, was caved on while working in one of the drifts. A mass of rock and earth fell on him, dislocating his left ankle and bruising him otherwise so that he will not be able to work for some time, both legs being bruised badly.

Silver and Gold From Black Copper.

No. 3.—The Copper Sulphate Crystals.

As the crystals contain all the insoluble as well as the soluble materials, they must be dissolved and recrystallized in order to separate them. The solution-tanks and crystallization-launderers are all situated on the upper story. Between this upper story and the lower ones the boilers for making the steam are placed. Across a passage, about two meters wide and above the boilers, are three tanks 3.20 meters square and 0.60 meter deep (see engraving), heated by furnaces for dissolving the fine crystals. The solution is 0.50 meter deep in the vats, and they are covered. The vats are lined with lead and are heated by an arched furnace, the fire of which is made to circulate twice on each side of the fire place by flues which join behind it. The fire place itself is arched with brick and covered with iron plates. These plates are 0.96 meter by 1.15 meters by 0.015 meter thick. They are the same plates which are used round the works for flooring.

These vats connect at the bottom by a short spout with a launder on the outside, in which there are two pipes, closed with conical stoppers. One of these is on the level with the bottom, and serves to empty the mud collected there. The other, raised a little above it, is used for drawing off the clear mother liquor. This mother liquor from the last crystallization in the tanks below is pumped up into them so as to be about 0.40 meter deep and heated to from 70 degs. to 76 degs. R. It is diluted with water until it is at from 15 degs. to 18 degs. B. Only about half of the mother liquor is used for this purpose. The other half is pumped up to be used in dissolving the granulated copper. The crystals are then added. It is not allowed to concentrate beyond 26 degs. B., as the crystals which are produced from a more concentrated liquor are too small to be easily sold. The fire is drawn when the solution is made. While the solution of the crystals is going on the liquor is kept constantly stirred with wooden rabbles 0.30 meter long by 0.20 meter wide, with a handle four meters long. As a very small quantity of silver goes into solution with the copper crystals, it is necessary to precipitate it. This is done with the very fine shot copper which is produced when the copper is granulated for solution, which precipitates all the silver. In order to prevent any loss of heat the tank is covered with a hood and the surface of the liquor protected with boards.

When the solution has taken place, the liquor is left until it settles, which will generally take about 12 hours. During this time it cools down to about 65 degs. R., and falls to 29 degs. B. It must not be allowed to go below this temperature, as there would be danger of small crystals forming. It must therefore be made to cool as slowly as possible, so as to prevent its being too cold when it comes to the crystallization tanks.

Our Correspondents.

Aside from the general contents of the *PRESS* this week, there are two letters from our special correspondents, one from Nevada and one from Montana, which deserve special perusal. Mr. Huston has been traveling through Idaho and Montana in the interest of the *PRESS*, and gathering for our readers a great deal of information of value and of passing interest. From his letter may be gathered a very good idea of the condition of mining affairs in that prosperous Territory. The letters of our Nevada correspondent, of which that of this week is the sixth, have also been very good indeed.

We shall always be very glad, indeed, to receive communications from any of the districts or camps of the coast relative to the mines and general progress. It need not deter any one because they are not practiced in writing, for if the facts are stated we can prepare the letters for publication. We are always pleased to receive letters from our friends in the mining camps.

ENGINEERING NOTES.

THE PANAMA CANAL.—Lesseps is truly a wonderful man. Any other engineer would succumb at once under the terrible drawbacks which he is meeting with in construction of the Panama canal. But Lesseps appears in no wise discouraged. From all indications he will gain a favorable report from the engineer which the French Government has sent over to examine the work. Although nearly as much money has already been spent as was at first contemplated for the entire cost, with only thirty per cent of the excavation made, he will undoubtedly get the large additional sum for which he now asks. That spent, or even the half of it, there will be no going back in the matter. It will be cheaper to go on and finish than to entirely lose that which will then have been paid out; for all agree that the work can be done. There are no impossible engineering difficulties in the way—all that is needed is money, and the French people will "go their bottom dollar" on De Lesseps' word. The grand old man says the canal will surely be completed in a reasonable time, and when done he proposes to charter a first-class steamer, on board of which he will embark with his family and friends, steam out of some French port, cross the Atlantic and be the first to pass through the canal. That done he will return to France via the Isthmus of Suez, and, let us hope, take in San Francisco on the trip. Such an event will most gloriously crown the life of one of the most noted and energetic engineers which the world has ever produced.

A SHIP CANAL THROUGH OHIO.—A plan for the opening of a ship canal from Cleveland to the Ohio river has been perfected and surveys partially made. The route to be taken is the Ohio canal and Muskingum river. With this connection completed, a ship canal will be opened from New York to New Orleans via the Erie canal, Lake Erie, Ohio canal, Ohio and Mississippi rivers. The main part of the work will be from Trenton, Coshocton county, to Cleveland, along the Ohio canal, a distance of 106 miles, which will cost about \$10,000,000. The Muskingum branch is now in condition for its new uses, save some dredging, and the matter will be duly represented to Congress. By this route ships would have to pass through only about 100 miles of canal from Cleveland to the Gulf of Mexico.

SHIP CANAL STATISTICS.—The largest ship canal in Europe is the great North Holland canal, completed in 1825. It is 124 feet wide at the water surface, 31 feet wide at the bottom and has a depth of 20 feet; it extends from Amsterdam to the Helder—60 miles. The Caledonia canal, in Scotland, has a total length of 60 miles, including three lakes. The Suez canal is 92 miles long, of which 66 miles are actual canal; it is 26 feet four inches deep, 72 feet 5 inches wide at the water surface. The Erie canal is 463 miles long; the Ohio canal, Cleveland to Portsmouth, 332; the Miami and Erie, Cincinnati to Toledo, 306; the Wabash and Erie, Evansville to the Ohio line, 374. The Panama canal is to be 45½ miles in length.

NEW MODE OF PROPPELLING.—Capt. John Giles, a practical mechanic, claims that a much higher rate of speed can be had by changing the position now given to the propeller at the stern of the ship, as well as its inclination or dip. He would put the propeller under the ship and just forward of the mizzen mast, giving it an inclination of 45° with the plane of the ship's motion. With a propeller thus situated, he believes he can get forty knots an hour where now only twenty are had. The theory is based upon the manner of propulsion of animals, in which, as we know, the efforts of propelling impulse all radiate at an angle from the line of motion.

THE BROOKLYN BRIDGE CABLE IS WEARING. When it goes, it will cost \$7000 for another. A better grip would have been easier on the cable and on the public. The cable should be long enough to arrange for switching the trains thereby. The switching engines are a "give away" on the cable design.

TURNING GRAY.—Many persons begin to show gray hairs while they are yet in their twenties, and some even in their teens. This does not, says a medical writer, argue premature decay of constitution. It is purely local phenomenon, and may co-exist with unusual bodily vigor. The celebrated author and teacher, George Borrow, turned gray before he was thirty, but was an extraordinary athlete at sixty. Many feeble persons and others who have suffered extremely both physically and mentally, do not bleach a hair until past middle life, while others, with no assignable cause, lose their capillary coloring matter rapidly when about forty years of age. Race has a marked influence. The traveller Dr. Orhigny says that in the many years he spent in South America, he never saw a bald Indian and scarcely ever a gray haired one. Negroes turn more slowly than whites. In this country sex appears to make little difference. Men and women grow gray about the same period of life.

OWING to the largely increased travel over the Central Pacific, consequent upon the immensely reduced rates, the eating stations are taxed to their utmost capacity.

USEFUL INFORMATION.

What Is Soda Water?

Soda water is ordinary drinking water, impregnated with carbonic acid gas under pressure, usually sweetened with flavored sirups, and cooled to render it deliciously palatable and refreshing. Without sirups it is generally sold by druggists in siphon bottles as carbonic acid water, and is prescribed and recommended by all physicians as beneficial and healthful.

How Soda Water is Made.

Pure water, free from chemical or organic impurities, is the first requisite. Injurious chemicals dissolved and held in solution are invisible and often occur in the brightest and clearest spring water, rendering it unfit for use in making soda water. Chemical analysis only can detect them, and such water should not be used. Organic impurities held in suspension can readily be removed by filtration. To obtain the gas for mixing with the water, a compound of carbonic acid and lime (usually marble dust) is placed in a generator with sulphuric acid, which last combines with the lime and displaces the carbonic acid which is liberated as a gas. The gas accumulates under pressure, and is conducted from the generator through a purifier to a receiver about two-thirds full of pure water. By agitation the contents of the receiver are thoroughly mixed, the pressure raised to about 150 pounds to the inch, and the fountain is ready to attach to the cooling box for use. Bicarbonate of soda was originally used in the making of "soda water," hence its peculiar name. "Carbonated" would be a more appropriate name, now manufactured. The sirup should be flavored only by true juices, or by extracts made from the natural oils, expressed from fruits, etc. Artificial chemical flavorings are common, but dangerous. The New York and Brooklyn Boards of Health have passed rigorous ordinances, and are taking steps to stop the sale of the poisonous trash so often sold as "soda water" by unscrupulous dealers, and even by some druggists of popularity and reputation. Impure soda water is often the result of using polluted water, impure gas, deleterious sirups, etc., but the greatest danger arises from improperly constructed reservoirs for holding the "soda water," from metallic contamination in the coolers, pipes and connections. Pure "soda water" should keep good indefinitely if stored in pure block-tin fountains, encased by steel.

STOVES IN HOLLAND.—The stoves there are a curiosity, although there are a few of German and French manufacture in use, that are more modern in model. The real Holland stove consists of a cast iron pot with a hole in the bottom in which sits a loose grate and so loose is that woe he unto the fire maker that pokes too strongly. Even a good draft is apt to upset the whole business into the air pan. The fire pots set in a box of sheet iron with a hole in the side to admit the pipe to the pot and one in the front for draft. They are not provided with anything like a damper. The more expensive kind are made fine with much open work of cast iron; others have a top of marble, white, gray or black, while the most expensive are encased in tiles of old Delft. It is unnecessary to say these stoves, "kachels" they are called, give very little heat, so little in fact that people of all classes use a sort of heater, similar, I think, to the kind that our grandmothers used to carry to church with them, consisting of a wooden box or foot stool lined with zinc or brass, the top well perforated; inside is an earthen pot filled with turf or charcoal, which has been first "burned off" in a kitchen fire. Ladies making calls here in the winter are at once supplied with such a "stove." The kitchen stove is on the same plan as the others, only the sheet iron box is larger to give more space on top, which has many different sized holes, each with a sheet iron cover, to which is riveted a long handle, giving it a strange appearance. There is only one place on these "kachels" where anything will boil, that being directly over the fire. If more than one kind of vegetables are to be prepared for dinner they must take their turn over the fire and then be set back to keep warm. The oven is practically of no use as there is no way of heating the sides or bottom.—Delft Correspondence.

A NATIONAL DIRT MINER.—A man by the name of Clark on Capitol Hill has gone to a good deal of trouble for a little notoriety, and deserves all he can get. It occurred to him that it would be a good idea to mix the soil of all the States and Territories in the Capitol Park, and about a year ago he wrote to Postmasters and other officials from Maine to Arizona. In reply he received a package of earth until his collection was completed. Then on Washington's birthday, he mixed the earth up in a box and dumped it in a corner, where our national flower, if we ever have any, ought to be sown.

A DECORATED GOBLET.—An interesting home-made method of natural decoration consists simply in taking a glass or goblet and placing in the interior a little common salt water. In a day or so a slight mist will be seen upon the glass—hourly this will grow until in a very short time the glass will present a beautiful appearance, the glass being enlarged to twice its thickness, and covered with beautiful salt crystals packed one upon another exactly like some

peculiar fungus or animal growth. It is necessary to place a dish beneath the glass as the crystals will run over. The glass can be made additionally beautiful by placing in the salt and water some common red ink; this will be absorbed, and the white surface covered. No more simple method of producing inexpensive or beautiful ornaments can be imagined, and by using different shapes of vases and shades, an endless variety of beautiful forms can be produced.—Scientific American.

"HORSE SENSE" is well illustrated in the way that some of them perform their duties on the top floors of New York warehouses, where other power is not available, in the work of hoisting goods to the different floors. In one case a horse has thus been kept at the top of a high warehouse for eleven years, without having been down to terra firma but twice in the whole time. The horses are directed when to pull and when to stop, pulling by the sound of the check rope when shaken from below, to which they invariably give a prompt attention that might well be imitated by many workers in a higher field, but otherwise they are always left to themselves.

COPPER-LINED TANKS are often known to give trouble by leaking, after a few years, much of which arises from the manner of soldering. Most plumbers use common solder, made of lead and tin. For this kind of work, pure tin should be used, and the lap thoroughly sweated through. The nails should also be of copper.

SPEED OF ICE BOATS.—It is stated by the *Scientific American* that a first class ice boat, sailing on first class ice, will move from three to four times faster than the wind that drives the boat. For example, a wind having a velocity of fifteen miles an hour will drive the boat at the rate of from forty to sixty miles an hour.

HARD AND SOFT JOURNAL BEARINGS.—Mr. Barr, of the C. & M. & St. P. Ry., says that very soft bearings lose nearly 40 per cent less weight than hard brass or bronze per 1000 miles run. The journals under soft bearings decrease in diameter nearly twice as fast as those under hard bearings.

CATHAY was the old name for China, so called by the Venetian traveler, Marco Polo, who, in the employ of the Khao of Tartary, visited it early in the thirteenth century. It was the land Columbus expected to find by sailing westward from Spain.

CROWN AND FLINT GLASS.—The difference between crown glass and flint glass consists in the composition—crown glass being composed of silica, potash and lime, while to these ingredients is added about 40 per cent oxide of lead for flint glass.

GOOD HEALTH.

The Administration of Medicines Before or After Meals.

The *Philadelphia Medical News* lays down the following general principles: Medicines that are irritating should be given when the stomach is full, unless the chemical changes which must then occur will destroy their qualities. Mineral remedies, such as the salts of copper, zinc, iron, and arsenic, should be given after meals unless local conditions require their administration in small quantity before meals. Of the latter, arsenic affords a capital illustration. Large doses, acting as an irritant, should follow food, which protects the mucous membrane; but small doses, intended to act upon the stomach terminals of the vagi, must be given when the organ is empty. Oxide and nitrate of silver, intended for local action, should appear in the stomach during its inactivity, lest, at other times, chemical reactions destroy the special attributes for which these remedies are prescribed. Iodine and the iodides given on an empty stomach promptly diffuse into the blood; but if digestion is going on, the acids and starch form products of inferior activity, and thus the purpose which they were intended to subserve is defeated. Substances prescribed to have a local action on the mucous membrane, or for prompt diffusion unaltered, are preferably given before meals. Active medicines, in doses near the danger line, are more safely administered after meals.

Probably the most important questions connected with the period of administration of remedies are those affecting the acidity and alkalinity of the blood and urine. First, as to acids. An acid taken into the stomach before digestion begins will determine, by the laws of osmosis, a flow through the intervening membrane of the alkaline constituents. Hence, when there is an excess in the formation of the acid constituent of the gastric juice, an acid may be given before meals to check the osmosis stomach-ward of the acid-forming materials. When the alkaline condition of the blood and urine is alike in excess, when shall acids be administered? Obviously, in the interval between the digestive acts; for then, the stomach being empty and the veins flaccid, the most favorable conditions for the diffusion of acid into the blood exist. Alkalies require different handling. It is a matter of quite common observation that an alkali, as the bicarbonate of soda, will quickly relieve the excess of acid

by neutralizing it; but it is equally true, although not so clearly recognized, that the relief it is purchased is at the expense of a continually increasing recurrence of the same malady. It may then be affirmed, as a rule of practice, that the habitual use of alkalies to relieve an excess of acid is unwise and hurtful. Alkalies are used to increase the formation of acid when the gastric glands perform this duty inadequately. An alkaline given before meals diverts to the gastric glands, by the laws of osmosis, those materials in the blood out of which the acid constituent of the gastric juice is elaborated. There are two periods when alkalies may be used to lessen the acidity of the urine—just before meals, when the acid-forming materials in the food diffuse into the stomach glands, and the alkaline medicament diffuses into the blood and outward into the urine; and after digestion is completed, when the alkalies diffuse directly into the blood, without interference from the contents of the stomach. Again, there are remedies which should be given with the meals, such as food adjuncts, and medicines required in the process of tissue construction. Wine intended to act as a food is most beneficial when taken slowly during the course of the meal. The objection as regards the ill effect of alcohol on pepsin is not applicable, except to the stronger spirituous wines in large quantity. Iron, phosphates, cod-liver oil, malt and similar agents should, as a rule, go with food through the digestive process and with the products of digestion enter the blood.

HEALTH AND LONG LIFE.—Thousands of people annually ruin their constitution by swallowing too much medicine. It may seem a very strange thing for a medical man to say, but it is nevertheless a fact. It is a dangerous thing to fly with every little ailment to the medicine chest. The use of tonics, unless under medical advice, should be discounted; a tonic is sharper than a two-edged sword, it is a tool that needs to be used with caution. There are now, I am sorry to see, some aerated waters coming into use which contain the strongest mineral tonics, that are apt to accumulate in the system with the most disastrous results. They should, therefore, not be drunk *ad libitum* as to quantity, or without guidance as to quality. Rest should be taken with great regularity. One day in seven should be set apart for the complete rest of both body and mind. Independent of this, all who can afford it should take an annual holiday. Traveling is quite cheap, and two weeks or a month's relaxation from care and business cannot make a big hole in the purse of one who works all the rest of the year and knows how to economize time. Innocent pleasure and wholesome recreation conduct to longevity. All work and no play sends Jack to an early grave. Recreation is to the mind and nervous system what sunshine is to the blood. As a physician, I must be allowed to say just one word about the calming, quieting effect of religion upon the mind. The truly religious make by far and always the best patients, their chances of recovery from serious sickness are greater, and so is their chance of long life, simply owing to the power they have of submitting themselves quietly, yet humbly and hopefully, to whatsoever may be before them.

THE GROWTH OF THE HUMAN BODY.—It has occurred to a Danish pastor in charge of a large institution for children to observe the process of their growth, and to endeavor to ascertain the laws by which it is determined. He has now been engaged on the subject for five years, weighing and measuring some one hundred and thirty children daily during all that time. The children are measured once a day, but they are weighed four times—in the morning, before and after dinner, and at night. Mr. Hansen asserts that the figures thus obtained prove the existence of three well-marked periods of growth in the year, further divisible into some thirty lesser stages. Bulk and weight are acquired between August and December. From December to April there is a further increase, but at a greatly diminished rate. From April till August the weight and bulk gained in the spring period are lost; so that at the beginning of August the weight is almost the same as at the close of the previous December. The growing period, on the other hand, is in the spring and early summer; so that the two processes do not go on together. Mr. Hansen believes that similar laws are discernible in the vegetable world. Be this as it may, he has accumulated a valuable mass of statistics on an interesting subject, and one which hereafter may yield practical results. Food and clothing presumably play an important part in growth, and possibly admit of adaptation to the very natural determination of the vital energy at different seasons.

HURRY AND WORRY.—Some men are in incessant action, early and late and all through the day. They have no time for family or friends. As for holidays, the less for them the better. They have inherited a nervous temperament, and are doing just the wrong thing with it—allowing it to hurry them to an untimely end. They wear themselves out. Their brain is ever in a state of morbid activity almost like that of an insane man. A little careful planning and a proper laying out of work, and especially doing everything in the proper time, would avoid all such hurry and worry, make work much easier, secure an abundance of leisure and greatly increase length of life.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

ANOTHER STRIKE AT THE MOORE.—Amador Dispatch, March 17: We are informed that a 20-foot ledge of fine ore was struck in the Moore mine a few days ago. This is now considered one of the most substantial mines in the county. Work at the Kennedy mine is being pushed forward in a vigorous manner, and we hope soon to be able to record it among the good dividend paying mines of the county.

Butte.

MAGALIA RIDGE.—Cor. Oroville Register, March 20: Prospecting and mining are as lively as ever. The Black Channel is driving ahead with good prospects. The Calumet has had a slide that stopped work for a week past. The Johnnie Bare and Parks mine is taking out a good share of the precious metal. Operations will soon begin on the Smith mine at Toad town, and you may soon expect to hear of a strike there as the channel will be easy to tap with the proper machinery.

Contra Costa.

STEWARTVILLE.—Concord Sun, March 20: Only a short time ago it was rumored that Stewartville would share the same fate as Nortonville, and that the mines would close down forever. Many besides the miners of Nortonville suffered from the loss at the closing of the Black Diamond mine. But from present indications Stewartville may live and bloom for generations, although it is regretted that Belshaw & Co. do not possess better mines; yet these enterprising gentlemen, despite such obstacles as water, breaks and fire still push ahead. The mines are working most every day, and the sales of coal improving.

Calaveras.

AT WORK.—Mt. Echo, March 18: Work is progressing with considerable vim at the Baumhoger mine near Altaville. The ore is crushed in an arastra which receives its motive power from an over-shot water-wheel 24 feet in diameter. The character of the rock is very good, and we expect to hear of a good cleanup shortly. Adjoining the above-named property is the Maltman mine, where operations are being pushed vigorously. The rock now being mined is of a very good grade. The ore of this mine is also crushed in an arastra operated by a 24-foot water-wheel. At the Matson mine in this place work is going steadily on. The mill is kept in operation day and night. This mine adjoins the celebrated Gold Cliff mine, and is on its southern extension. The Lane mine in this place is running in full blast. First-class ore is being taken out and the batteries are kept in motion continually. This mine is a valuable, paying property and is operated on an extensive scale. At the Toser mine in this place everything is booming. The mine is running full handed and a superior quality of ore is being extracted. The mill has been temporarily closed down, awaiting the arrival of new dies for the batteries. At the Stickle mine in this place work is progressing rapidly. The hoisting works and mill are kept in active motion day and night. We are informed that the quality of the ore now being stoped is remarkably good. The rock now being milled is taken from the 200-foot level. Numerous minor ledges are being prospected in this vicinity at present, some of them making an excellent showing. Without a doubt quartz mining will be booming in this section as soon as spring opens and the weather gets fairly settled.

MURPHY'S.—Cor. Calaveras Citizen, Mar. 20: A blast in the Oro Plata mine on the 10th inst. disclosed some fine ore. The future of this company bids fair to rival any company for good results anywhere in the county. The ore is of exceeding good quality and Supt. Morse is sanguine of ultimate success. Cunliff and Driver's mine on Indian creek is being worked with good results. A report of the mine is to be made for parties interested in the mine in San Francisco. This is one of the most promising mines in this vicinity. The placer mine of McCormick, Bisbee and Thomas, on Central Hill is now in full blast and good returns are expected. There can be no question but that the enterprise will prove a most profitable one.

El Dorado.

POCKET MINE.—El Dorado Republican, Mar. 20: George Kimble has bonded the old Hodge Pocket mine at Poverty Point from Seneca Davis and George Barlow, and is preparing timbers to use in the tunnel. The mine has not been worked for a number of years, and the tunnel has caved in a number of places. Some good pockets have been struck in this mine, and we hope George may find another as good as the best.

Inyo.

DEER SPRINGS.—Inyo Reporter, March 18: Mr. W. A. Greenly, of the Greenly Mill, Cottonwood creek, across the Inyos, dropped in for a little while the other day. The mill will not be started up for some weeks yet. The prospects of the camp generally are brighter than they have been before for many a day. Sam. Piper and A. A. Riddle continue taking out ore from a mine they have been operating on since last summer. Some of this ore is exceedingly rich, but only some five or six tons of the poorer grade from this mine has so far been milled and this yielded \$35 per ton gold. O. K. Berry is running a tunnel to cut a body of ore at the bottom of a shaft he sunk a number of years ago, from which he then took several tons of ore that milled about \$300 a ton in silver. This ore was worked at Belleville. The mine is called the Chloride. Broder & Co. are working on one of the largest gold mines out there, called the Golden Rule, and are getting out splendid ore and a good deal of it.

COMMENCED.—The work of rebuilding the old Sacramento mill at its new site on Coldwater some six miles from Bishop Station was begun in earnest this week. Mr. J. L. Bray is the boss mechanic, and his reputation as such is a guarantee of good work. The mill is to be run by a hurdy-gurdy

wheel, and is designed to work ores from the Casey mine, from which it is about three miles distant.

ORE AT DARWIN.—Inyo Independent, March 18: Frank Silva is getting ore out at Darwin that will pay well. Parties who visited the mine very recently say he has a large body of ore in sight. About two carloads are reported to be on the dump that will be shipped to San Francisco in a few days.

Monterey.

THE NEW MINES.—Salinas Index, March 18: Very little is being said of the Melville Mining Company at present, no shipments of ore or bullion having yet been made. It has leaked out, however, that one of the members of said company retorted a 15-ounce piece of the ore and got from it five bits in silver, or at the rate of over \$1200 per ton. Two more of our business men have been stricken with the fever and located claims in Melville district, fitting out a mining camp with tools and provisions and set their men to work. The Bull's Head M. Co. have commenced operations on their claims, and outsiders are anxiously awaiting the result.

Nevada.

BADGER HILL MINE.—Grass Valley Union, Mar. 20: The Badger Hill mining company having purchased the hoisting gear at the Washington company, bids will be received until to-morrow evening for its removal to the Badger mine, and its putting in place, beside the necessary grading, building, and the general erection of the plant for the hoisting works. All the plans and specifications have been drawn, and are to be seen at Johnston's hardware store. The works are to be run by water, the pumping and hoisting being done by a Pelton wheel, 12 feet in diameter, which is now being constructed by Mr. Pelton himself. The erection of the works is now to be pushed as fast as the weather will permit, and it is hoped to start up the underground work in the mine before many weeks pass away.

Placer.

AN IMPORTANT DEVELOPMENT.—Placer Herald, March 20: On the 10th inst. the prospect tunnel in the Dardanelles mine at Forest Hill, owned by Gen. Jos. Hamilton, broke through the bed rock into the channel and struck what is regarded as a very flattering prospect. This is good news for Gen. Hamilton, and a very important development for Forest Hill and the county. It furnishes additional proof of the great extent of the paying drift ground in that region and adds one more to the opened mines of the district. It tends also to further establish the claim made by experienced miners, that the Forest Hill Divide is destined in the near future to become the richest and most extensive drift mining district of the State.

NEW SHAFT.—Placer Argus, March 20: A new 200-foot shaft was begun at the Chicago mine near Penryn two weeks ago. It will take three or four months to complete it. Two shifts of men, 14 all told, are employed in the mine at present. A new wire rope for hoisting purposes has been ordered and as soon as that is in use a third shift will be put to work. H. J. Bevans is the superintendent.

GRIZZLY FLAT.—Placerville Observer, Mar. 18: The mining outlook of this district is decidedly promising. The Melton mining company have closed their mill for the time being, and Superintendent McClellan is vigorously driving the main tunnel so as to dump ore directly from the mine into the mill thus saving the expense of hoisting to the surface and handling twice. The Mount Pleasant is running regularly as usual. Capt. Smith has resigned the superintendency to a successor, but work is being vigorously prosecuted under the new management. Superintendent Alexander with his usual persistence and energy is pushing ahead the main tunnel at the Crystal mine. Under the management of Mr. Russel some new and valuable developments have been made at the Independence. Mr. Russel is confident that he will show up this old mine equal to its former palmy days in '67-8-9. Messrs. Smith & Hare of Cleveland, Ohio, have taken hold of the Chicago & Ohio Consolidated mine, and are preparing to construct reduction works on that valuable property, so long idle for want of capital. Mr. Hare has been for many years working to perfect a process for the desulphurizing of ores, which he claims to have succeeded in doing to his entire satisfaction, and assures your correspondent that he can work ores up to within five per cent of their assay value, at an expense not to exceed \$2.50 per ton. If this be true, it will work a revolution of inestimable value to the mining interests of the county, and give Mr. Hare the wealth he deserves for his years of toil in bringing forth this valuable invention. Mining men are looking forward with much interest to the day when Messrs. Smith & Hare get this process, with the necessary machinery, in operation on the Chicago and Ohio Consolidated. There have been many claims in this district and south on this belt held, some of them for twelve years, by simply posting notices, without doing a stroke of work. On the first day of the present year outsiders were up very early, the result being that many of these claims are now being developed and promise well.

THE IRON MINE AT HOTALING.—Placer Republican, Mar. 20: An accident occurred at the Hotaling iron furnace last Friday on account of which the fires had to be banked and work suspended. The road that connects the dumping lever with the bell in the top of the furnace broke and the bell, a large conical shaped piece of iron, dropped down into the furnace. It was destroyed as a matter of course. A new one is being made in San Francisco which will probably not be ready for use until next Monday. All work in the mine was stopped. There are at present about 2,000 tons of ore mined and when that is smelted there is no doubt that the surface will be shut down for good. It will not be in blast more than six weeks longer.

San Bernardino.

COAL.—San Jacinto Register, March 18: Messrs. P. L. Griffin, C. C. Bailey and McCormick & Weber have bonded the Arbuckle coal mine, located about 20 miles south of Riverside, in the Temescal range of mountains. This mine was only recently discovered and is proving to be a fine one, as a two-foot vein of coal has thus far been developed, while the work is only in its infancy.

MEN ENOUGH.—Calico Print, March 20: The King mine stood another draft of fifteen or twenty

men during the week. Outsiders will please note the fact that there are at present more than enough men in Calico, and act accordingly.

Sierra.

GOOD HOPE.—Sierra Tribune, March 20: At the Good Hope mine near Downville a tunnel is being run to tap the vein below the old workings. There is quite a long distance yet to run to reach the desired point, but the company hopes to get into the ledge this summer. San Francisco parties are furnishing the means to work with. H. H. Purdy manages the operation.

Shasta.

AMALGAM.—Republican Free Press, Mar. 20: Tom Green of Deadwood brought down this week \$2200 in amalgam. He has ordered a five-stamp mill which will be here in a few days. He took home a rock-breaker and other machinery Wednesday. Ollie Whitton has sold his interest in the Croesus mine on Squaw creek to Billy Edwards of Red Bluff for \$4500. Seven tons of rock from Major & Frick's mine at Lower Springs crushed in Andy Fife's mill averaged \$50 a ton.

Trinity.

REPORTED RICH DISCOVERY.—Humboldt Standard, March 18: Anton Silver, an old acquaintance, is down from New River. He reports a rich discovery on Slide creek and in which Capt. H. S. Soule is interested. He received the information from an old-timer in that region known as "Chicken," and believes it to be authentic. The report is that as the result of two pans of dirt washed the sum of \$30 was obtained. That sounds fabulous, yet it may be entirely true. The find was made in the immediate neighborhood of a claim in which Billy Levasseur is interested, and the latter gentleman naturally feels pretty good over the announcement. There are some of the New River locators of the last two or three years who are as firm as ever in their faith in the wealth of that region. Among them are Dean, Levasseur and Soule. And they intend to adhere to the present belief until the New River mines have been more thoroughly tested.

DEVELOPMENT CO.—Eureka Times-Telephone, March 18: The New River Development Co. are not doing anything in the mining district at present. They have leased several of their claims and are allowing the parties to develop the same. A short time ago Frank Zane leased the Oscar and Bear Cave and is working them. The company has already expended in New River several thousands of dollars, and still have great faith that all will turn out right. No definite plan of action has been decided by them as to just what would be done this spring, but the idea is to take one or more of the claims and prospect and open it up and ascertain what there is in it. Tunnels have already been run in the Selina and North Star, and Soule is now working the Oro Fino with good results, so it is stated.

Tulare.

A VALUABLE FIND.—Visalia Times, March 20: John Holmquest, who has been running the lime kiln in Frazier valley for the last five years, has discovered a mine which promises far to surpass anything of the kind ever before known in Tulare county. About five weeks ago he struck a gold-bearing quartz vein on the divide between Frazier and Pleasant valleys, about 30 miles southeast of Visalia. He has already sunk a shaft 27 feet in depth. The vein is three feet wide and of a slate formation, with well-finished walls of slate on each side. There is also a tale between the slate and the lead, which is considered by mining experts as a good indication. The lead runs southeast and northwest. The ore is easily removed, as it is broken and decomposed. Mr. Holmquest has made one or two blasts, but he claims that blasting is not necessary. Some time ago he sent samples of the ore to Adolph Mack, in San Francisco, to be assayed for gold. The returns showed \$42 to the ton in gold alone. The rock also contains considerable silver, but thus far it has not been assayed for that metal, although experts who have examined it say that it will assay well in silver. It will be assayed for silver soon. Mr. Holmquest owns 80 acres of land at the place mentioned, which he took up five years ago. Last fall he picked up some flat rock in the lime kiln that assayed 21 ounces in silver and \$12.60 in gold. This find caused him to believe that the precious metals existed in that locality. The ore does not show free gold, but he obtained particles of it from some of the rock which he broke in a mortar. Several extensions along his claim have already been taken by other people.

NEVADA.

Washoe District.

HALE AND NORCROSS.—Enterprise, March 20: Work is suspended at the bottom of the deep winze and station on the 3200 level, and will so remain until the Combination shaft is sunk deeper, so as to form a working connection. The proposition at present is to thoroughly explore the very promising ore developments between the 3200 and 2900 levels. This is being actively and effectively done. The good body of vein ore found in upraising above the 3200 level has shown considerable improvement during the week. The upraise is over 40 feet, following the inclination of the vein, and it has been stoped out to the extent of three or four square sets of timbers, showing a width of at least 20 feet, and how much more is not ascertained. The ore is of a fine free-milling character, carrying an unusually large percentage of gold, and giving high assays. The whole of it will pay well under the stamps. By some this is thought to be a different vein from that being followed above it, upward from the 3000 level, but a very competent and experienced bonanza expert, who recently examined it, is of the opinion that it is simply a good kidney or concentration of ore belonging to the same vein. This, however, will be ascertained in due time. The upraise in the vein above the 3000 level is progressing well, and a few feet further will carry it through to its proposed connection with the 2900 level. Explorations with the diamond drill from the face of the main north lateral drift on the 3200 level, toward the Savage, are discontinued, and the drift itself will shortly be advanced in that direction.

OPHIR.—On the 300 level a lateral drift south has

been started from the main west drift to explore a promising section of the vein in that direction. On the 400 the drift north from the main west drift is in 321 feet. The west drifts on both these levels run from the old Mexican shaft and cross-cut the vein. These drifts, as well as the lateral drifts north and south from them, have thus far developed only low-grade ore, yet as very rich bunches and streaks of ore were extracted from the surface and as low as the 250 level at this point in former days, it is fair to presume that more of the same sort may be found in the present deeper explorations. On the 200 level the joint Mexican and Union drift running northwest from the Ophir shaft through the Ophir ground is now in 506 feet and is running in Mexican ground. Material, vein porphyry, with streaks and bunches of quartz.

CON. CALIFORNIA AND VIRGINIA.—The mine is in full work again, as before the breakage at the Eureka mill, giving a daily output of over 400 tons of ore. The grade does not run high—about \$12 per ton on the average. The south-west drift on the 1400 level is in 395 feet, and explorations are going ahead in the old bonanza stopes reopened by the north-west drift on the 1650 level.

POTOSI.—On the 3200 level the main lateral drift south from the Chollar is in 83 feet beyond the line, and making excellent progress in dry ground, following the west side or footwall of the vein. Unless interrupted by some adverse circumstance Superintendent Hamilton will have this drift run through to the Fullion line in a shorter space of time than is generally expected.

CHOLLAR.—No crosscutting as yet on the 3200 level and no orders received to resume sinking the Combination shaft. In fact sinking this shaft deeper at present would interfere with the exploration of the 3200 level, including the advancement into the Potosi ground which is being conducted through the Chollar.

SIERRA NEVADA.—The crosscut east on the 520 level, some 1,800 feet north of the shaft, was advanced 54 feet during the week, making a total length of 230 feet. Material in face, vein porphyry and clay, with a little water, indicating something more favorable in that direction.

GOULD AND CURRY.—On the 600 level the work of reopening and repairing the main drift to the southwest is making excellent progress, 60 feet having been advanced during the week. This drift is supposed to reopen a body of good ore known of toward the Savage line.

YELLOW JACKET.—Daily yield about 130 tons from above the 1300 level, keeping the Brunswick mill supplied. Explorations are still being continued on the 1700 level, with a view to developing an expected ore body at the northern portion of the mine.

MEXICAN.—On the 500 level east crosscut No. 2 is in 240 feet. No change in material. A crosscut west from the main north lateral drift has been started which is now in about 40 feet. Material, vein porphyry, with streaks of quartz.

BEST AND BELCHER.—The pumps are merely holding the water at the 228 level of the shaft, draining the openings and ground at that point before proceeding any deeper. The pumps are working smoothly and well.

CROWN POINT AND BELCHER.—The old upper workings continue their regular yield of low grade ore, with a good contribution of higher grade from the 1700 and 1600 levels, the daily output being about 360 tons.

KENTUCK.—About 45 tons per day continues to be the yield of the mine, supplying the Rock Point mill exclusively. This ore comes from above the 1300 level, and is of pretty low grade.

ALTA.—The main lateral drift north on the 700 level is still running in dry vein porphyry and has reached within about 60 feet of the Benton ground.

JUSTICE.—On the 350 level at the southern portion, a considerable amount of low grade ore is being developed.

UNION CON.—North lateral drift No. 2, on the 500 level is in 256 feet. Material in face vein porphyry.

Bell District.

AT WORK.—Belmont Courier, Mar. 19: Work is still being steadily pushed in the mines of Bell district.

Esmeralda District.

THE ENGLISH COMPANY.—Aurora Star, Mar. 16: The Consolidated Esmeralda Mining Company (Limited), of London, England, having purchased a number of properties in Esmeralda mining district including more than forty claims, hoisting works and a twenty-stamp quartz mill is attending to its own business. Considering the season of the year and the difficulties to be encountered in getting lumber and other material, the company have done considerable work toward developing some of their mines, besides putting up hoisting works on the Humboldt Consolidated, or the Blasdel series, where the main shaft is nearing the 200 level as fast as three eight-hour shifts of men can sink it. Work has been going on in the Middle Hill tunnel, or Coulter group of mines and the tunnel is still going ahead. Considerable work has been done on the Del Monte claims on Last Chance Hill and more is contemplated. In short, this company have purchased a number of properties, either of which would have been considered good in former years. The Esmeralda, a patented claim on Silver Hill, the Durand and Live Yankee (patented), of the Middle Hill group, the Wide West, Last Chance, Spur and Real Del Monte, on Last Chance Hill, and the Juniata (patented), of Martinez hill, and the Del Monte hoisting works and shaft; the new Esmeralda group of twelve locations; the Humboldt and the Humboldt West (a patented claim), together with its twenty-stamp mill, constitute with some other claims, an aggregate properties hard to equal.

Garfield and Lapanta Districts.

THE FARRINGTON MINES.—Aurora Star, Mar. 16: The Farrington gold and silver mines of Esmeralda county have been incorporated. These mines after a great deal of labor and patience, have been placed by the promoters before the London mining public who are ever ready to invest in good dividend mining and milling property, whether situated in Nevada or elsewhere. The prospectus of the Farrington mines (limited—gold and silver) has been issued in London. The properties consist of

nine mines in this county, eight of which are silver and "situated in Garfield mining district; the other is the celebrated Lapanta gold mine in the Lapanta mining district, all of which are of great value and in the county of Esmeralda, on the line of the Carson and Colorado railroad. Four of the mines are developed and opened out by tunnels and shafts, and supplied with a five-stamp mill, engine and the usual accessories.

Globe District.

SILVER.—Belmont *Courier*, Mar. 19: Purley Plane has taken the contract to sink the shaft 100 feet on the newly bonded prospect in Globe district.

Ione District.

WORK PROGRESSING.—Belmont *Courier*, Mar. 19: Work is progressing steadily in the Indianapolis mine, near Ione with constantly improving indications. We hope that an extensive ore body will soon be uncovered.

Jackson District.

NEW MILL.—*Silver State*, March 20: Ferd. Ried returned yesterday from a trip to Jackson District. He says the new mill has started up, and is running steadily on ore from the Pennsylvania mine. The ore is crushed by stamps and then concentrated, from fifteen to twenty tons being reduced every twenty-four hours.

Jungo District.

PROSPECTING.—*Silver State*, March 20: Charley Bernard and William Merrill, of Jungo District, are in town. There are nine men prospecting and mining in the camp. Bernard has leased the Atlantic table and lottery mines, now consolidated, and is taking out rich ore, which he finds in paying quantities. It is thought it is a good chloriding camp, as the ores will pay to ship.

Jefferson District.

ORE.—Belmont *Courier*, Mar. 19: The chloriders of Jefferson continue to take out some very good ore.

Northumberland District.

CHLORIDERS. Belmont *Courier*, Mar. 19: The Northumberland chloriders continue to take out good ore.

Peavine District.

TAKING ORE.—Belmont *Courier*, Mar. 19: James Fraser continues to take ore out of his mine near Peavine.

Pioche District.

FINE ORE.—Pioche *Record*, Mar. 13: The two young men chloriding out in the Bullionville mine, located about three miles west from town, are extracting some very fine ore. This is the mine discovered by John H. Ely in 1875, after returning broke, from his gay life in Paris. The mine is owned by Dick Rich, John H. Ely and Lawson Atchison, and is said by the many to require only little development to make it valuable property. It was the first and only mine in Ely district in which a patent had been applied, until within about a month, when C. H. Patchen made application for patent to the Gold Ledge ground.

Pennsylvania District.

MILL.—Pioche *Record*, Mar. 13: The mill in Pennsylvania district will start up the first of the coming week. If the wire screen had been on hand it would have started the first of the past week.

San Antonio District.

CHLORIDING.—Belmont *Courier*, Mar. 19: It is whispered that considerable chloriding will be done in the San Antonio mine, as soon as the snow goes off.

Tuscarora District.

NORTH BELLE ISLE.—*Times Review*, March 20: Work has been entirely suspended, pending litigation.

BELLE ISLE.—North drift from east crosscut No. 1, 450-foot level, has been extended 13 feet. Belle Isle and Navajo joint crosscut, 150-foot level, has been extended 20 feet.

GRAND PRIZE.—South drift on the 200 level extended 28 feet, and the north drift, same level, 15 feet. Stopes are producing considerable good ore at present. Mill is running all right, but will close down in a few days, temporarily.

NAVAJO.—No. 1 upraise, east lateral, 350-foot level, has been carried up six feet. No. 2 upraise, east vein, same level, has been carried up six feet. Crosscut No. 2, 250-foot level, has been extended four feet; the rock still remains hard. South drift from the same crosscut has been extended 13 feet.

Washington District.

NO BOOM.—Belmont *Courier*, Mar. 19: The mining boom has not struck Washington district yet. Uncle Billy Koch continues to work his mine in San Juan canyon.

ARIZONA.

COPPER.—Arizona *Silver Belt*, March 20: That Globe will shortly become the acknowledged copper producing district of the southwest is becoming more and more apparent to those who have given the matter their attention. In addition to the already well known deposits or veins of copper in this district, we have to add the recent satisfactory developments in the Ogden and Crown Point mines, hitherto but little known. The croppings are strong, bold and well defined and plainly in view for 2,000 feet, and give hopeful indications of large ore bodies being revealed as the vein is sunk upon. The ore is carbonate and as tested in the Old Globe furnaces, is easily reduced. It carries its own flux and is of exceeding richness.

NOTES.—Prescott *Courier*, March 18: We hear that Mr. Moody has sold an interest in the Ready Pay mine to Chicago parties. Hon. Sumner Howard and co-owners of Lawler Bros.' great Santa Maria mines will shortly have them patented. Col. H. A. Bigelow, David Grubb and other miners of Hassayampa district, will commence shipping ore as soon as snow gets a little thinner. Groom Creek mines are yielding pretty rich ore.

The Dougherty mine, in Martinez district, is well liked by those who have examined it. Turkey creek miners are preparing to ship rich silver ore. It is

rumored that the Gray Eagle and Cougar mines, in Bradshaw district are wanted by moneyed men. We heard yesterday that Wells H. Bates, Professor Blake and other gentlemen are in Weaver district looking after lode properties. The hydraulic and placer miners continue to send in gold, and we believe they are all doing well.

SALERO.—Ineson *Citizen*, March 16: Tom Durand, who is now in the city from Salero, reports some very important strikes in that camp. In the Lucifer mine owned by the Santa Rita M. and M. company formerly the Salero company, a fine body of ore has been encountered, much of which assays 4,000 ounces per ton, in silver, and the pay streak gives an average assay of over 1000 ounces. Six tons of this rich ore are now on the dump, and more is being taken out, with a prospect of the rich body holding out. The Wide West also belonging to the company, is showing some very fine ore, and the ledge is improving with depth. Changes are being made in the mill and the leaching process will be used. The Olmstead mine adjoining the Lucifer, owned by Mrs. L. E. Durand, has also developed a fine body of ore assaying across the ledge 1500 ounces to the ton. Harry Holland has recently made a fine strike on one of his claims. At a depth of from 12 to 15 feet he has a three foot ledge of solid ore that gives an average assay of 130 ounces and from 40 to 60 per cent lead. It is a fine prospect. He is taking out lots of ore and will ship it to Deming for the Pueblo smelter. The whole camp is bristling with activity and encouragement, and a good future is looked for in that favored locality.

COLORADO.

GOLD AND SILVER.—Biggs & Co., lessees on the Anglo-Saxon extension west, are drifting and raising on a vein of decomposed mineral about four inches in thickness. The Coulter lode is being worked under lease through the Bullhead tunnel by Finley, Thompson and Walters, who have opened up two feet of quartz sprinkled with gray copper. The lessees on the Muscovite lode, Democrat mountain, have a vein of solid galena which mills 14 ozs. silver and 61 per cent lead. The Bush lode, on Sherman mountain, shows a vein of solid ore in the bottom of the 110-foot shaft two inches in thickness which mills from 35 to 50 ozs. silver and about 50 per cent lead. Forty-seven cars of ore were shipped from Georgetown last month, the total weight of which was 1,160,210 pounds. We are informed that a good strike has been made in the Backbone, mineral from the new streak returning as high as 600 ozs. silver to the ton, besides a good per cent in lead. Gustafson & Co., lessees on the Duncan lode, Brown mt., are working upon an excellent streak of mineral, and are extracting large quantities of ore. They made a shipment of about 4500 pounds this week, which returned, according to class 260 and 229 ozs. silver per ton, and about 23 per cent in lead. Quantities of high grade ore are being produced by the lodes in the Claypool tunnel. Millruns this week have testified to that fact. A good body of high grade ore is said to have been opened up in the Baltic lode, on Silver creek. One party of lessees on the Stevens lode, Argentine, have about 90 tons of ore ready for shipment. A party of Italians took a lease on the tunnel level last week, and are stopping on a 12-inch vein of mineral. About 45 men are prosecuting work in the Baltimore mine. Drifting is in progress upon levels numbers 4, 5, 6, 7, and 8, and a number of good ore bodies are opened. The Mauch Chunk lode, on Beaver creek, which has lain idle so long, is now being worked by the owners Hannigan & Co. The drift upon the lode is being pushed ahead with good indications. The Cory City mine is working fifty men, who are rapidly opening up new ground. Work is being pushed in every direction, and although most of it is on development, yet the mine is producing on an average of \$10,000 per month.

IDAHO.

MINING DITCH.—Idaho *World*, March 18: The McLean Mining Company of Eagle Rock has just made a contract with W. H. Homer, formerly sheriff of Oneida county, for the construction of a large mining ditch to be 16 feet wide on the bottom and when completed will be about 25 miles long and will cost about \$25,000.

STRIKE IN THE MINNIE MOORE.—About midnight of last night, just after the 11 o'clock shift went on, they struck the richest body of ore ever cut into in the Minnie Moore. It was struck in a crosscut in the 600 level and at 5 o'clock this morning the men had gotten into it two feet. They have taken out one carload of the richest ore ever taken from the Minnie Moore, and up to noon of to-day the other wall had not been reached, so nobody knows how wide the ore body is. The news of this rich strike spread like fire soon after five o'clock. Men met on street corners and gave expression to their joy by cheers and hearty handshakes. It puts Broadford on the "lively" list as of yore, and it gives confidence to all classes along the river. There are to-day about 50 men at work on the Minnie, and since this "find" they will be increased, most probably, inside of 60 days, to 200. And as an equal number will be steadily on the Queen of the Hills which adjoins the Minnie and has vast quantities of ore exposed, it is safe to predict that in a very short time Broadford will boom as she never boomed before.

THE BULLION DIVIDE.—Wood River *Times*, March 17: William H. Atkinson, who has lease on the Red Cloud claim, at the head of Narrow Gauge gulch, is down after a prolonged stay on the Bullion divide. He reports the claims in that vicinity looking well, and showing more ore than ever before. In the Red Cloud's new workings there is a drift over 100 feet long, which shows ore all the way from the initial point to the face with more ahead. From this drift a raise has been driven 30 feet to the surface—which shows ore all the way. A winze is down 25 feet, all the way in ore. From the workings fully 300 tons of high-grade ore can be extracted whenever it is desired to do so. This work has all been done this winter. The old workings of this claim also show well in ore that goes 80 ounces silver and 75 per cent lead per ton. This claim is good for all of 600 tons of ore this summer. It is owned by the Porter Brothers and Mr. Mason, the Cyclops, which adjoins, shows ore all the way in the winze, which is down 50 or 60 feet below the tunnel level. A main working tunnel is being driven to tap this ore-body at a depth of about 100 feet from the surface. The ore referred to is of higher grade than

any yet extracted from this claim. Chris. Hendricks, who has a lease on the French Boys' group, is working four men, and extracting about two tons per day. He must have all of 30 tons of first class, and 50 to 60 tons of second class ore on the dump now, and will doubtless make a splendid clean-up in the spring.

MONTANA.

PHILIPSBURG.—Cor. *New Northwest*, March 19: Never before in the history of our camp has its future seemed more permanent or promising. This is largely attributable to the interest that mine owners themselves are taking in the development of properties heretofore unworked, save by yearly representation. Among the number of lode claims that development has proved to be valuable and worthy of extended notice is the Young America. This mine is opened by tunnel levels, carries about 24 inches of very high grade chloridizing ore, and exhibits all of the pleasing features of a true fissure vein. The fortunate owners, Messrs. Mackey, Bullard & Co., are to be congratulated in this successful ending of a long and arduous work. These gentlemen, with everything but strength, endurance and faith against them, drove tunnel No. 2 500 feet through a hard granite country to catch the vein on its dip. Their reward is great as well as deserving.

WEST GRANITE.—The header of No. 1 tunnel is being steadily driven east. The vein is wide and strong, the ore laying to the footwall. As depth is what is desired, the work is being pushed to that end; the vein filling between the ore and hanging wall, after removal, constituting the level proper. The footwall of the vein is not known, and, of course, the thickness of the quartz cannot be given. In breaking off pieces here and there, however, the rock looks well, and in texture and general appearance is precisely similar to that nearest the surface in the Bonanza ground, a few hundred feet further up the hill. This company is expending every dollar in systematic development, and there is a notable absence of poor work in the timbering of the level. Three shifts of men drive five feet ahead every 24 hours. The Granite is working ore from the upper stopes. The output this month will probably reach 150,000 ounces. Of course the mine looks well—it could not look otherwise under its present management. The Hope is running steadily in ore out of the new strike. I understand the quality is first-class and the supply adequate for the present year's run.

THE BURLINGTON.—The mines at Burlington have been brought to their present prosperous condition through the united efforts of poor miners. The Burlington mine is worked under lease by Messrs. Edwards, Job, Madder & Co., who have done an immense amount of work on the property. A new shaft has been sunk 120 feet, new and capable hoisting and pumping machinery has been put in place at great cost, and to-day the Burlington is one of the best little mines to be seen anywhere. The stopes in the 120-foot level are opening out nicely, the ledge is constantly increasing in value, and the lessees are correspondingly happy. There are nearly thirty men employed by the lessees.

THE ALICE.—*Free Press*, Mar. 20: During the past week the ledge recently discovered on the 800 foot level of the Alice has widened out to such an extent, and has increased in value so much, that the management have concluded to commence the work of carrying the shaft down to the 1000-foot level. This work will be commenced next Monday and it is confidently expected that in forty days the 1000-foot level will be reached. The 800-foot looks grand. The stopes on the 700 foot level and also on the other levels of the mine are producing the usual quantity of ore.

THE MAGNA CHARTA is looking unusually good and there is more ore in sight in the mine than ever before. The stopes on the 100, 200, 300, 400 and 500-foot levels are producing an immense quantity of good mineral while the ledge below the 500-foot level is as yet hardly touched.

THE ANACONDA.—This is a very remarkable mine. It is one vast treasure bed. The ledge in the 700-foot level is increasing in width and richness daily until to-day it is nearly seventy feet wide and carries a larger percentage of silver than ever before. On the 800-foot level the ledge is nearly one hundred feet wide, all of which is good paying ore.

THE MOULTON.—The stopes on both veins are producing the usual quantity of ore, and Supt. J. K. Clark is very sanguine concerning the future of the property. Another dividend of the property has been declared, and on Monday next the stockholders will have \$30,000 dividend among them.

THE LEXINGTON.—The main shaft of this mine is nearing the 1000-foot level. When that point is reached crosscutting for the ledge will be in order. The stopes on the upper levels of the mine are looking and producing well.

NEW MEXICO.

NOTES.—Hadley, Wallace and Radcliff are developing their valuable claims in Water canyon. The Socorro Tunnel Company will soon commence operations on their property, three miles west of this city. The ore output from the Comstock mines for the last three months of 1885 was 60,370 tons, valued at \$249,897.73. A bonanza mine has been struck one mile west of the lake, and three miles from Lake Valley. T. B. Fitch and Dennis Laughton, who were grub-staked by J. M. Webster of Hillsboro, made the strike. There is nothing official or authentic yet in regard to the prospecting process at Lake valley, though the result is looked forward to with interest. The local paper says that 100 tons a day are treated, worth from \$8 to \$15 per ton, at a cost of \$5 per ton, but this is based on no authority.

LAKE VALLEY.—Rio Grande *Republican*, March 16: Lake Valley was put in a fever heat last Monday by the report of a new discovery of what promises to become another bonanza. From John Russell we have gained the particulars. The location of the strike is one mile west of the lakes, three miles from Lake Valley. A short time ago T. B. Fitch and Dennis Laughton, who were grub-staked by J. M. Webster, of Hillsboro, went into the locality and began prospecting. They located an old abandoned claim and went to work with twenty-five feet of a shallow shaft that had been sunk in the quartzite during the excitement some years ago. After breaking through the iron capping they came upon horn and native silver. For ten days they

kept their discovery a secret, until they and Mr. Russell, at whose place they were stopping, could secure the surrounding property. The mineral is identical with that found in the Lake Valley bonanzas, and assays something over \$5000 per ton.

OREGON.

QUARTZ.—Jacksonville *Times*, March 19: Granville Sears and John Robinson have discovered a promising quartz ledge in the hills west of the latter's place. The County Clerk is kept busy recording locations of quartz mines, which shows that much prospecting is still being done. The quartz mill at this place continues to do good work and is run day and night. Work was commenced Wednesday on 30 tons of quartz belonging to McKenzie, Brown & Co. W. V. Jones, the Foots creek merchant, informs us that the miners of that district are doing well and that several fine pieces of gold have been picked up lately. The storms of the past week have been quite beneficial to the placer miners, whose water supply was generally beginning to fail. They will have the effect of prolonging the mining season considerably. Tim Dugan is now engaged in sinking a shaft on the silver-bearing ledge in Jackson creek district; he is interested in with Dr. Lemper and others. He has gone down 30 feet and the prospect is favorable. Brown & Co. have bought a half interest in Grob & Brandel's quartz ledge, paying \$10,000 for it; we learn; \$1000 will be paid down at once and the balance in 90 days. No doubt we will hear of more mining property being sold at good figures. Another promising quartz ledge was struck this week in the tunnel now being run by the Jacksonville Milling and Mining Co. Gold can plainly be seen in the ore. About 50 feet of the tunnel remains uncompleted, which will be finished in the next few weeks. The Jacksonville quartz mill finished 30 tons of ore from Grob & Brandel's mine on Jackson creek. A cleanup was made Wednesday which showed that the experiment was quite successful. As the amalgam had not been retorted as yet we are unable to give the result in dollars and cents. J. Garvin, of Wagner creek, was here this week, who informed us that E. Ray and himself had found a quartz ledge in the Gold Hill district which he thought the richest and most permanent yet discovered. Considerable gold has already been pounded out of specimens. The ore will soon be thoroughly tested at Brown & Co.'s mill in Jacksonville.

UTAH.

THE LEEDS' MINE.—Southern Utah *Times*, March 18: Kimple & Lewis, the lessees of the Leeds, while their work so far has been directed toward prospecting and opening up the mine, have several hundred tons of ore on the dump and broken in the workings, ready for hoisting. They have within the past five months, by the application of good judgment and hard work, developed a big mine out of property that was abandoned several years ago by a poor management, as worthless. Judging from the ore bodies in sight and the appearance of the ledges and formation, we can safely say that between forty-five and fifty tons of ore per day can be extracted for months to come. The ore body in the ledge, at a point about eighty feet below the old tunnel is fifteen feet in width and at another two hundred feet below this, twelve feet wide. The ore in these ledges assays from fifteen to thirty ounces per ton. A few weeks ago the feather edge of a vein of ore was discovered in the floor of an old stope, which on prospecting, opened up to eighteen inches of sixty ounce ore.

OTHER NOTES.—McCormick & Co., received \$2,690 worth of Stormont refined silver this week. The Stormont and Christy mines and mill are all working smoothly, with favorable results. Ed. Lockney, of the East Reef Bonanza, has temporarily suspended operations, discharged his shift boss, Mr. Smith, and gone to Frisco to become a wage worker. His property is a good one, the ore averaging forty ounces, but he cannot work it to profit until the mills meet miners half way, and reduce ore at a rate that will leave a reasonable margin or the mine owner. The situation must shape itself thus before the Reef can hope for prolonged prosperity, for it stands to reason that miners will not work for glory and go without grub.

REVIEW.—Salt Lake *Tribune*, March 19: For the week ending March 17th, inclusive, the receipts of bullion and ore in this city amounted to \$154,573.25, of which \$42,334.16 was ore and \$112,239.09 was bullion, thus keeping up the receipts of ore in this city, as compared with ore shipments abroad, at a high rate. The week previous the receipts were \$161,286.14, of which \$112,559.61 was bullion and \$48,726.53 was ore. The Ontario product for the week was 17,490 ounces. The product of the Daly for the week was \$7609.36 of ore. The Daly's Marsac mill is getting down to better work, the amalgamation now exceeding ninety per cent. Base bullion output for the week, \$18,000; fine bars, \$39,110. The Hanauer smelter turned out \$20,470 in bullion during the week; the Germania, seven cars, \$18,079.01; the Pascoe, \$1450. The Stormont sent up from Silver Reef, \$1520 in silver bars. The Horn Silver is producing some ore, but how much, or of what grade, it is impossible to learn. Ore receipts were \$9116; silver and lead ores \$15,190; Kent ore, Montana, \$728; Nevada ores, \$1280; lead and silver, \$16,020.16. The mining outlook about Stockton, Ophir and Dry Canon is growing brighter as spring approaches. The roads are so bad that but little ore is being sent out, but it is being extracted and piled on the dumps ready for shipping. The Hidden Treasure sent in eighty-seven tons of ore which was sampled at Foote's sampler in this city yesterday. It runs about \$90 per ton in silver. Frank Foote has got his machinery to work on the old Southport, which was abandoned twelve years ago by John Lawson. When he got the mine pumped out and the debris removed, he found ore along the shaft for fifty feet, of good grade and from eight to twenty inches in width. This property promises well, and it is believed many of the other claims long since abandoned in this district will yet become good properties. It is, however, no small undertaking to clean out these old mines and re-timber portions of them, as has been done with the Southworth, to make them secure. Mr. Tiernan is having his mine worked by lease, and the ore is being sent to the Pascoe smelter at Stockton. The lessees are talking of putting on a steam hoist, and have been negotiating for the machinery. The Kingston is also shipping ore to the Pascoe smelter.

Gardner Spring Governor.

TATUM & BOWEN,

25 to 31 MAIN STREET, SAN FRANCISCO, CAL.

91 to 93 FRONT STREET, PORTLAND, OR.

SOLE AGENTS FOR

GARDNER GOVERNOR COMPANY,

J. S. Mundy's Patent Friction Hoisting Engines.

The Mundy Patent has been sustained in the United States District Court of New York against the Ledgerwood Manufacturing Company, and also in the District Court in the State of New Jersey against Kendall & Roberts for infringement. Therefore all parties are cautioned against making, using, or selling Friction Drums that infringe this patent.

Gardner Governor.

GORDON & MAXWELL COMP'Y MINING PUMPS.

THE MOST EXTENSIVE PUMPING MACHINE WORKS IN THE UNITED STATES.

MORRIS COUNTY MACHINE and IRON CO. New High-Speed AIR COMPRESSOR.

We have recently furnished the contractors the machinery for La Trinidad (300 tons per day) and Silver Queen (100 tons per day). These mines are located in Mexico and belong to La Trinidad Company, of London. The Process is the Wet Concentration, and the Plants are, without doubt, the most substantial and complete of the kind ever built.

WE MANUFACTURE ENGINES, BOILERS, AND SAW-MILL MACHINERY, and Carry in Stock:

Wood and Iron Working Machinery, Best Belting, Lubricants for Cylinders and General Machinery, Including the Celebrated ALBANY LUBRICATING COMPOUND.

IMPORTANT TO GOLD MINERS!

SILVER-PLATED AMALGAMATING PLATES FOR SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.

Warranted the Best Made, Durable and Satisfactory. Full weight of silver and best quality of plating guaranteed.

BEST SOFT LAKE SUPERIOR COPPER USED.

3000 Orders filled. References first class. Prices the very lowest. Have received every Medal awarded on the Pacific Coast for Mining Plates. Old Mining Plates Bought, Replated, or Gold Separated.

SAN FRANCISCO GOLD, SILVER AND NICKEL PLATING WORKS, 653 & 655 Mission St., San Francisco.
E. G. DENNISTON, Proprietor.

These Plates can also be procured of JOHN TAYLOR & CO., Dealers in Assayers' and Mining Material, 112 to 118 Pine St.

NOTICE—Mining men are cautioned against purchasing inferior quality of Silver-Plated Mining Plates now being manufactured in this city. There has been a general complaint by purchasers that these plates proved defective in plating and short in weight of silver, assays showing great deficiency in silver guaranteed. Thin, light plating looks the same as heavy, but has no durability. Good plates can be furnished at same price these poor plates cost.

List of U. S. Patents for Pacific Coast Inventors.

From the official report of U. S. Patents in DEWEY & Co.'s Patent Office Library, 252 Market St., S. F.

FOR WEEK ENDING MARCH 16, 1886.

- 337,919.—SPRAYING PUMP—John Bean, Los Gatos, Cal.
- 337,817.—MARINE GOVERNOR—Chas. Dickenson, Portland, Ogn.
- 337,941.—BRIDGE WALL SUPPORT—Jos. Enright, San Jose, Cal.
- 337,942.—EXERCISING MACHINE—B. Farley, S. F.
- 337,864.—HYDRAULIC MOTOR—G. S. Pidgeon, San Diego, Cal.
- 337,901.—PULVERIZING MILL—E. A. Wall, Bullion, I. T.
- 337,910.—WATER LEVEL INDICATOR—Jos. R. Wilcox, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Mining Share Market.

There does not appear to be any interest manifested in the stock market, notwithstanding the reported improvement in the ore development in the upraise above the 3000 level of the Hale & Norcross. The lateral drift south on the 3000 level through the Potosi ground is progressing finely, passing through a very interesting section. No orders are yet received to resume sinking the Combination shaft. This, however, is a movement not temporarily necessary, just at present, as the companies concerned desire to thoroughly explore the 3000 level continuous through them all, before going deeper. Meanwhile work at the 3200 level and station of the Hale & Norcross deep winze is therefore necessarily suspended, and will remain so until the shaft is sunk to that level. The Virginia Enterprise speaks as follows of the Hale & Norcross development. The ore vein being developed by upraising from the 3000 level of Hale & Norcross, is opening up splendidly, and showing a valuable ore body, which promises to develop into a genuine old-time bonanza. It is good-paying ore, giving bonanza assays, but its extent in any direction is not as yet ascertained, the present proposition being to follow it with the upraise to a connection with the 3000 level. It certainly is a very promising and encouraging prospect.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports: Alice, March 19, \$48,560; Moulton, 16, \$21,104; Lexington, 16, \$22,112; Silver Bow, 16, \$18,992; Germania, 16, \$5079; Hanauer, 16, \$3710; Germania, 17, \$5419; Hanauer, 17, \$5550; Alice, 17, \$12,727; Hanauer, 19, \$5400; Pascoe, 19, \$1350; Stomont, 20, \$2110; Hanauer, 20, \$2600. For week ending March 17, Wells, Fargo & Co. at Salt Lake shipped bullion valued at \$66,316; McCormick & Co., \$40,638; T. R. Jones & Co., \$34,099; and Union Bank, \$13,520; total, \$154,573.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department 10, San Francisco: HUBERT CONCENTRATOR Co., March 19.—Object to engage in the manufacture of the Hubert Dry Ore Concentrator, the Hubert Wet Ore Concentrator and other machines for the reduction and treatment of ores. Capital stock, \$1,000,000. Trustees, Hall McAllister, Wm. H. Rodda, Marc Levinston, Jos. Hubert and E. L. Campbell. CHICAGO MINING Co., March 19.—Location, Amador Co. Capital stock, \$2,000,000. Trustees, John Cuffs, Charles H. Eaton, J. M. Bryan, P. A. Doane and George W. Watson.

THE NEW CIRCULAR STAMP BATTERY.

Quartz men for years have endeavored to find a substitute which would combine the simplicity and efficiency of the ordinary straight battery and do away with the clumsy and expensive frame work. Many new machines have been brought forward, but have proved inadequate, and quartz men generally have determined that stamps are still to be accepted as the most economical and effective. In view of this fact I have closely applied myself for years to overcome the objectionable feature of the straight battery, noticeably, the cumbersome woodwork, which is always more expensive than the iron-work, and yet retain the stamps. In this I have succeeded and know the battery now presented will meet the approval of all practical mill men. The points gained are as follows: 1st. It is in every detail as to feed, tappets, stems, shoes, dies and boxes, the same as the ordinary battery. It is simply a straight battery thrown into a circle and so constructed that the iron work is self-supporting, doing away with all the woodwork, and the structure rests upon its foundation more firmly than a wooden battery possibly can. 2d. The application of power is nearer the base than in any ordinary battery consequently there is less leverage and less vibration. 3d. The foundation for battery will not cost ordinarily over \$75.00. 4th. A 12-stamp mill will not require a larger building than an ordinary 5-stamp straight battery. Hence a great saving in lumber and labor. 5th. More quartz can be crushed for power expended than by a straight battery, as there are no "end stamps" to impede work, and the discharge surface is much greater. 6th. It is a good amalgamator on account of the circular motion given to the ore during reduction, as 85% to 90% of the metal is retained inside of the battery. 7th. Foundation and power being ready, the mill can be erected and running in three days after it is delivered on the ground, thus saving in working time enough to pay the cost of a mill. ALMARIN B. PAUL.

These mills are built with 8, 12 or 20 stamps in one mortar, and when ready for work, will cost a great deal less than an ordinary straight battery. Parties desiring Stamp Batteries, will do well to investigate this mill, which can be seen at the Works on a large practical scale, and by model at the office. They will be sold on favorable terms. For particulars apply to

CALIFORNIA QUARTZ MILLING COMPANY. ALMARIN B. PAUL, General Manager Room 20, Safe Deposit Building, San Francisco, Cal.

THE CELEBRATED Woodbury Oils.

Pure, Perfect, Uniform!

The WOODBURY OILS are in use on the Central and Southern Pacific Railways, and on nearly every railroad and steamship line on the coast.

We are not agents for other manufacturers, but have our own works, and adapt here all our Oils to the requirements of home machinery and our climate. We can show recommendations and records of tests, showing a saving to our customers of 50 per cent on their lubrication last year. Address

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake. The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

Market St., Elevator 12 Front St., S. F.

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.**

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS.
(\$575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrators are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco. As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement. The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them. Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for. N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Room 7—No. 109 California Street, - - - SAN FRANCISCO, CAL.

\$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

**THE
"TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE, placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

THE JENKINS STANDARD PACKING

IS ACKNOWLEDGED BY USERS AS THE BEST in the world. Unlike all other Packings, the Jenkins Standard Packing can be made any thickness desired in a joint by placing two or as many thicknesses together as desired, and following up joint, it vulcanizes in place and becomes a metal of itself (it is frequently called Jenkins Metal), and will last for years, as it does not rot or burn out. Avoid all imitations, as a good article is always subject to cheap imitations. The genuine has stamped on every sheet "Jenkins Standard Packing," and is for sale by the Trade generally.

PLANTS FOR GOLD AND SILVER MILLS,
embracing machinery of LATEST DESIGN and
MOST IMPROVED construction. We offer our cus-
tomers the BEST RESULTS OF 35 YEARS' EX-
PERIENCE in this SPECIAL LINE of work, and
are PREPARED to furnish from SAN FRAN-
CISCO or CHICAGO, the MOST APPROVED
character of MINING AND REDUCTION MA-
CHINERY, adapted to all grades of ores and SU-
PERIOR to that of any other make, at the LOWEST
POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DE-
LIVER in COMPLETE RUNNING ORDER, in
any locality, MILLS, CONCENTRATION
WORKS, WATER JACKET SMELTING
FURNACES, HOISTING WORKS, PUMP-
ING MACHINERY, ETC., ETC., of any DE-
SIRE CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD
ores of NEW and ORIGINAL DESIGNS, covered
by LETTERS PATENT. No other Furnace CAN
COMPARE with these for DURABILITY, and in
CAPACITY for uninterrupted work. MORE
THAN 150 of them are now RUNNING in various
parts of THIS COUNTRY, as well as many in
FOREIGN COUNTRIES, giving results NEVER
BEFORE ATTAINED as regards CONTINUOUS
running, ECONOMY of fuel, AMOUNT and QUAL-
ITY of BULLION produced. These CLAIMS have
been PROVEN BY RESULTS in ANY NUM-
BER of INSTANCES, and the GREAT SUPER-
IORITY of this SYSTEM of smelting ores DE-
MONSTRATED BEYOND QUESTION. COM-
PLETE PLANTS furnished to order of any CA-
PACITY, with ALL IMPROVEMENTS that ex-
perience has DEMONSTRATED as VALUABLE
in this class of work.

Beyond question the cheapest and
most effective machine of the kind
now in use adapted to all grades and
classes of ores.

This machine has been THOROUGHLY TESTED
for the past TWO YEARS, under a GREAT VA-
RIETY of CONDITIONS, giving most EXTRA-
ORDINARY results FAR IN ADVANCE of
anything EVER BEFORE REALIZED. A re-
cent COMPETITIVE TEST at the Carlisle Mine in
Mexico, showed an ADVANTAGE OF OVER 30
PER CENT in favor of THE DUNCAN. The
amount SAVED OVER THE TRUE being suf-
ficient to PAY THE ENTIRE COST of the ma-
chines EVERY MONTH OF THE YEAR. One
of its MOST VALUABLE features is as an AMAL-
GAMATOR. It saves all THE AMALGAM GOLD
and SILVER that ESCAPES the BATTERIES,
PANS or SETTLERS, making the machine worth
MORE than ITS COST for THIS PURPOSE
ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist-
ing and affording means for the continuous operation of a
Pump or Blower, without interfering with a hoisting ap-
paratus. It is made entirely of iron, no piece weighs
over 300 pounds. At the ordinary speed of a horse, a
1,000-pound bucket of ore may be raised 120 feet per
minute. The hoisting-drum is under the complete con-
trol of the man of the shaft, and is capable of carrying
500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

Steam Laundry Machinery for White Labor.

The exodus of the Chiacse, from the cities and towns of our commonwealth and sister States, which is being gradually accomplished by the silent, yet powerful workings of an inner law of our American social and political economy, has led, already, to the formation and organization of corporations and associations having, for their objects, the purposes of carrying on the business of laundrying, by the use of steam and the employment of white labor. Already at Healdsburg, Truckee and Eureka, in this State, and at Reno and Carson, in Nevada, entire plants for steam laundry purposes have been erected or are now in progress of erection, by means of the economy of which, and the employment of white labor only, the vexing problem of the Chinese question will be measurably solved, and a portion of the Mongolians be free to depart for their Celestial Kingdom.

In our issue of the 13th instant, we presented an illustration and description of a steam washing machine, manufactured and sold by Mr. J. B. Jardine, of this city; but as we incline to the opinion "that fair competition is the life of trade," and observe it as a true business principle, we take occasion to present in our present number, illustrations and descriptions of the improved steam washing machines and mangles, which are manufactured and sold by the Joshua Hendy Machine Works, of Nos. 39 to 51 Fremont street, this city.

These washers are an improvement on the styles yet introduced and an examination of the engraving will show the simplicity of their construction, the ease with which they can be handled in operation and the labor-saving principles and values which are evolved in and result from their use. These features are demonstrated by the fact that a No. 2 washer, 5 feet 6 inches in diameter, and 6 feet long, having a gear on both sides will perform all of the laundrying for a hotel or other public institution having say 500 guests or inmates, in one day in each week, or the equivalent of a hotel having 300 rooms.

These machines are provided, as shown, with automatic reversible motion, and hot and cold water and necessary steam pipes. They are now in use in the Stockton Insane Asylum, Napa Insane Asylum, City and County Alms House, San Francisco, Cal.; Salem Insane Asylum, in Eureka, Healdsburg, Santa Barbara, Reno, Honolulu, New Zealand, and all prominent laundries and hotels.

The horizontal, or box mangle, as is illustrated herewith, is the oldest existing substitute for the flat iron in the finishing or smoothing of bed and table linen, and its value is so well established that no laundry in hotel or institution is deemed complete without one. When run by steam power, it performs work as rapidly as a person can put the linen on the rolling pins and replace them under the box. The box is loaded with, say 800 pounds of stons, and this weight pressing on the linen while it is alternately tightened and loosened on the pins, and its surfaces rubbed together by the forward and backward movements of the box, imparts the soft and uniformly glossy finish, which is the box mangle's chief recommendation.

The foregoing named firm, "The Joshua Hendy Machine Works," are prepared to furnish complete and entire plants for thorough steam laundry work; embracing besides the

above, polishers, wringers, hot water and soap tanks and all the paraphernalia and outfit for drying rooms and closets and receiving and delivering offices; and they assure us that they will be pleased to furnish plans and specifications of all requisite laundry machinery and its general arrangement, and any information which may be requested to enable the managers of

The Alaska Mines.

In our "Mining Summary" is given this week some account of mines in Alaska, the means and cost of getting them, and the prospects. Quite recently new mines have been struck on the Yukon river and have caused quite a local excitement, men from the other camps leaving

CHARTREY'S IMPROVED STEAM WASHING MACHINE.

such associations as are being organized to select such outfit as may be best adapted to their special conditions of use.

CONCENTRATION.—At the Mexican mill, on the Carson river, Nevada, a concentrator is about being brought into use in working the ores from the 1000 level of the Crown Point and Belcher mines. The ore from this point, ran

in numbers for the new placers. Several prospecting expeditions have been sent up the Yukon river in previous seasons and gold found in several places. Still, none of the ground has been found rich enough to pay the wages necessary to induce men to remain in the locality. The season is so short during which placer mining can be carried on, and there is so much enforced idleness by reason of the long winters,

THE HORIZONTAL, OR BOX MANGLE.

very high in free gold during the bonanza days, more so than anywhere else on the Comstock. The lower grades of this same rock have been worked since as long as they could be found to pay, but by concentration it is thought that they can be made to pay still farther and more extensively, so to speak, as there are millions of tons of it easily got at.

SMALL DAMAGES.—In the suit of the Champion Mining Company against the Wyoming Mining Company (Nevada county), for \$300,000 damages and a perpetual injunction against the defendant working ground claimed by the plaintiff, Judge Walling of the Superior Court has denied the injunction, and gave the plaintiff judgment for \$120 damages and costs of suit up to the time the answer was filed by the defendants. The costs since filing the answer were taxed against the plaintiff.

that a mine must be a very good one indeed to be profitable.

It is said now, however, that Hughes, the discoverer of the new camp, brought in 62 ounces of gold as the proceeds of 11 days' work. This was last fall, and as Hughes has again started, he has been followed by a dozen different parties who want to find the place. There is only one way to go, and that is by launch to Chilcat, via Juneau, the baggage being packed over the divide by Indians. The chain of lakes is then met and the prospectors can proceed on canoes all the way. In fact the only way to get about Alaska is by means of boats, there being rivers, streams and lakes in every direction.

A large part of the country is heavily timbered, and the surface is in many places boggy and marshy, and covered with moss. This kind of ground is practically impassable. The

dense timber also impedes progress; but with so many streams it is possible to go long distances quite easily.

Those who know anything about the country advise those who intend going there not to do so unless well procured with money. Suitable outfits must be procured, Indians hired, etc. A man should at least have \$150 after he arrives in Juneau if he expects to go to the Yukon or Stewart rivers. Miners' wages at Juneau are \$4 and \$5 per day in summer, but there are a good many men there now, and more are going. The big Treadwell mine, as it is called, with the 120-stamp mill, is on Douglas island, and is producing from \$50,000 to \$75,000 a month.

The Mechanics' Institute.

Active preparations are being made for the annual fair of the Mechanics' Institute in this city, and it is desired that it shall eclipse previous ones. In view of the fact that there are thousands of Eastern tourists expected here during the continuance of the fair, it behooves our citizens to assist the enterprise in every way. The following committees for the ensuing year have been announced:

Finance—Waterhouse, McDonald and Kerr; Library, Rooms and Building—Mahoney, Kerr and Jackson; Books and Donations—Bassett, Spaulding and Waterhouse; Lectures and Classes—Spiers, Mahoney and McDonald; Printing and Advertising—Spaulding, Stout and Hopps; Privileges—McDonald, Waterhouse and Stout; Rules, Regulations and Awards—Kerr, Wilcox and Spiers; Power and Machinery—Jackson, Spiers and Mallon; Tickets and Admissions—Stout, Kerr and Spaulding; Location and Police—Mallon, Jackson and Mahoney; Decorations and Art—Bower, Hopps and Mallon; Horticulture—Hopps, Bassett and Wilcox; Special Exhibits—Wilcox, Bassett and Jackson.

Messrs. Kerr, Wilcox, Spiers, McDonald and Hopps have been appointed a special committee to revise the premium list and arrange for this year's distribution of awards.

The following recently appointed honorary commissioners of exhibits for their respective districts have accepted the positions: Mark L. McDonald, Sonoma county; M. M. Estee, Napa; Thomas R. Bard, E. P. Foster and W. R. Blackstock, Ventura; J. J. Morrison, Placer; C. B. Kimball, Butts and Yuba.

The following additional appointments have been made: Mendocino county—L. F. Long of Hopland and A. O. Carpenter of Ukiah; Alameda county—Henry Curtner of Warm Springs; Solano county—L. W. Buck of Vacaville and A. T. Hatch of Suisun; Sacramento county—O. R. Ruayon, Courtland; San Diego county—Douglas Gunn; Yolo county—George D. Fisk, Woodland; Butts county—E. F. Fogg and B. F. Jones.

JUDGE SAWYER, of the U. S. Circuit Court, in the case of one of the persons taking part in the expulsion of Chinese from Nicolaus, holds that the Chinese are protected from "boycotting" or violence by the United States constitution. The decision is being widely commented on. The questions will now come before the United States Supreme Court.

The several mining companies at Klamath river are now busily engaged in commencing to put in cribs and are also getting out timbers for wing-damming.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Dillon, Montana.

(Continued from last issue.)

[From our Traveling Correspondent, R. G. HUSTON.]

Pacific and Black Lead.

The Pacific is owned by the same parties and is well developed, with a tunnel in 250 feet and a shaft down at the head of tunnel 90 feet in depth. They have shipped ore to Salt Lake and their lowest returns were \$60 per ton. Another shaft down on this lead 75 feet is in very good ore. This level has a peculiar formation in a regular fire clay for foot-wall.

The Black Lead is owned by the same parties and is developed to a depth of 250 feet by a tunnel. A sample lot of three tons shipped to Pascoe, of Salt Lake, and treated by him, returned \$71 per ton. They have a large amount of ore on the dump—1000 tons I should think—a low estimate. There is also a very large vein averaging 14 feet, wherever they have opened it full width. Mr. Thomas has another fine looking property here, called the Lowain; shaft down 100 feet; average width 7 feet; assays run from \$40 to \$50.

The U. S. Grant, owned by John King, was just bonded by a party named Kelley, from Idaho, the bond running to July 4th. Mr. King has been shipping ore to Omaha and Butte that has yielded him from \$100 to \$200 in return. He has from 18 inches to two feet of this high grade ore, and about three and one-half feet more of lower grade, that assays from \$30 to \$40 per ton. The parties who have bonded it for \$35,000 are now at work with a crew of men to satisfy themselves of the permanency of the mine. This mine makes a fine showing, and no doubt the Idaho parties will push it to the front as rapidly as possible.

Near by this property J. D. Heald has a ledge called the Elfrida; has a well-defined vein from 18 inches to 2 feet in width, and a tunnel in 250 feet. A shipment to Omaha returned him \$149 per ton, gold and silver. These properties are within one mile of Virginia. Mr. Heald has a number of openings in his ledge, and all are similar in width and richness. There are still a

Few Placer Miners

Gauging around the head of the gulch, under the brow of Old Baldy, as the high mountain at the head of Alder gulch is called, who are making a grubstake to go prospecting on next summer. These mines are too far up to be reached with water enough for bedrock flume, and consequently are left for the prospectors for gauging diggings in winter, as they call them.

Virginia City

Was in the earlier years of Montana the seat of government, and that same was a bone of contention between Helena and Virginia for years; but finally Helena wrested it away from Virginia, and having the most central location will probably be able to hold the fort on the capital question for all time to come.

Virginia is now but a shadow of her former self when I first visited her 20 years ago. The streets were crowded from morning until night with a moving multitude then; now everything is quiet, settled down, and most of the old-timers who have confined their operations to legitimate business enterprises, and have been moderately economical, have acquired fortunes.

The town finances are controlled by two banking firms. Henry Elling and Messrs. Hall, Harrington & Co. are both strong firms, and seem to have all the business they are looking for. In groceries and general merchandise they have Henry Werken, Elling, Knight & Co., O. D. French & Co., R. O. Hickman. Only one hotel is run at present—the Madison House. This was about to change proprietors, Mr. Barney Marshall going on deck the 1st of March. The usual breweries, saloons, livery and sale stables, barber shops and all branches of trade are represented, and all seem to be doing a steady, lucrative business.

The *Madisonian* is the newspaper of the county. This was for a long time owned and run by Thos. Deyarmon, but he has become one of the capitalists of the town through the development of quartz interests, and the paper is now owned and run by Mr. Thos. H. Baker, who is an old hand at the business, as well as one of those pleasant individuals whom it does you good to meet.

Red Bluff District.

Is in Madison county, 32 miles northeast from Virginia on the stage road to Bozeman, and has some fair prospects. The Red Bluff mine owned by H. N. Blake is developed by a tunnel 500 feet long and taps the lead at a depth of 200 feet. The average width is from five to six feet; the ore carries both gold and silver, gold predominating, running from \$80 to \$100 per ton. Blake has just signed a contract with A. M. Essler of Helena to furnish him 500 tons and was just putting on men to take out the ore.

The Mohican owned by Elling and Ward of Virginia have four shafts down to water level, which is about 80 feet. They struck an immense volume of water, and with their crude machinery are unable to go lower at present. The lead is about 8 feet wide on an average and their best ore runs from two to three hundred

dollars per ton. They are now drowned out, but both of the owners are gentlemen of ample means and no doubt will put on good pumping machinery and work their property in ship-shape.

The Golconda owned by Olds and Hickman, is opened by a tunnel run on the vein for 600 feet and depth from the surface must be 350 feet; have a four-foot vein and ore averaging \$50 per ton—very refractory. To get good, full returns, it would require a finely appointed plant, which they have not. I should think that from appearances they have as much as 10,000 tons of ore in sight. That will yield them a nice little sum when they get an opportunity to have it properly handled.

The Grubstake in the same district is owned by Pope, Bayliss and McKee. This mine is opened by three tunnels; the middle one is in 700 feet and is about 400 feet from the surface; the lower tunnel is now in some 400 feet on the ledge. Ore shipped to Omaha, returns from \$150 to \$200 per ton. Eight men are working taking out ore.

The Red Chief is a large vein from 10 to 16 feet in width, and is owned by W. F. Young & Co. They have a shaft down 50 feet, as deep as they can sink without good pumping machinery. This ledge assays from \$8 to \$150, and if works were here for the proper treatment of this ore, this would no doubt prove a profitable property.

Messrs. Pope and Bayliss have another property here, called the Tippecanoe, on which they are working six men. They are running both tunnel and shaft. They have shipped ore to Omaha and have had returns of nearly \$125 per ton. This is a large and well-defined vein. The reason that no smelters have been built here is probably the lack of good galena ores; as yet none of any consequence have been developed, and consequently they have to keep on shipping to where these are convenient.

There has been some very rich discoveries made over on Meadow creek, very high up in the mountains, in what is called the Potosi district. The snow is so deep that nothing can be done in the winter season, and the mining season will be very short, consequently the mines will need to be proportionately rich to make it a good camp. The old camp of Sterling was on Meadow creek and a number of mill properties were erected there, but at the present there are none in operation; for what reason I did not learn, though the lack of pay is the probable cause.

Poney

Is sixteen miles west of Red Bluff and is the location of a number of pretty good mines. There is a mill property here owned by Henry Elling and Morris, of Virginia City. It is run by water power, and consequently does not run in the winter season. They have been for years working the Ned mine; they are down on it some 500 feet. At times it has paid handsomely. It is a gold and silver mine. The mill is a 20 stamp one, gold process, with concentrating machinery. They are at work this winter taking out ore, and are also at work on the Boss Tweed and a number of other properties in this vicinity. H. H. Wood has a property called the Atlantic and Pacific, from which he has worked about 500 tons, that averaged \$8 per ton gold. This is a large vein, but cannot now be profitably worked.

The Gilded Age is a fair prospect; the ore carries a good per cent of galena but it is not being worked at present.

The White Pine is owned by Thos. Carnian and is now being operated by Messrs. Frank Long and Boyd under a lease. They are working and taking out ore continually; there is a ten-stamp mill on this property and it is making a good showing.

The Robert Emmet mine is owned by P. H. Leonard. Two men operated this mine on a lease and cleared \$2800 each in six months. Mr. Leonard is now taking out ore that looks very well and is satisfied with the present outlook of his property.

Armstrong Bros. have a mine that averages \$15 gold in free milling rock, and are taking out ore and doing well.

The country east of Poney is a fine grazing country and there are large numbers of stock raised here, principally horses. From here I returned to Red Bluff and thence to Bozeman, which is the county seat of Gallatin county and a beautiful agricultural town. It is near the head of the Gallatin valley and contains a population of 2500. Many fine comfortable houses are here. The wealthier class of farmers in the valley have located their families here for the benefit of the school privileges and the many social advantages of living in a town of this size. The houses are all of the modern styles and in every way would compare favorably with any Eastern town of the same size. It is on the line of the Northern Pacific and is easy of access at all times of the year.

From Bozeman I returned direct to Butte via Moreland, Gallatin City, Three Forks, and Pipe Stone Hot Springs, and had two days of very uncomfortable traveling, on account of cold weather—the first I have had on the trip, now extended to 700 miles in a buggy in mid-winter over Montana mountain ranges, crossing the main range of the Rocky mountain chain twice, and continually crossing ranges and divides running up to 8000 and 10,000 feet altitude. All things considered, I had a much pleasanter trip than I had anticipated, or than the first week out gave promise of, as I lost my traveling companion at Hecla, 10 miles above Glendale, by getting caught in a snow slide and

killed. Kind fraternal hands were here extended, and he was laid away with Masonic honors, there being no one to whom to send his remains, no one knowing where his people were, and no data on his person to show where he was from.

Nevada—Bonanzas on the Surface.

The Pick Resigned for the Shovel and the Scoop.

[From Our Special Correspondent J. B. P.]

There were strange and weird fancies that came creeping over the mind as we turned our horse's head toward the famous old desert from Wadsworth and took out upon the ancient emigrant trail. Our horse, "Cloud" by name, once an excellent piece of property in the hands of Gov. Tritle of Arizona, was still high spirited, intelligent and noble in mind, but somewhat wasted and shattered in body. He could be most implicitly relied on so far as he could render us any service, but the twenty-two miles (stock miles, doubtless, as they were given by a stockman) to the nearest house, the late hour—3 o'clock p. m.—and the possible chance of a snowstorm overtaking us on the way, gave us some slight apprehensions that we should not reach this point we aimed at. It turned out according to our apprehensions. We were to keep the main trail, and we kept it. We pushed our faithful courser on the way for four hours, and then, when from hard travel in very heavy roads, we were thoroughly benighted under a moonless sky, we found this trail was taking us into what, we afterwards ascertained, was a temporary lake. As there was apparently no side cut-off, we allowed the horse to go forward, feeling his way, until he had traveled half a mile, waist deep, into this unknown lake, and then he, too, having lost the bed of the old road, became dissatisfied and struck out, the best he could, for some shore.

As we made a successful landing among the sagebrush, we felt ourselves fortunate (the horse as well as myself). The miry condition of the soil and the cloudy night precluded the possibility of our making any discovery of the route we had lost in the lake, and as we were not particularly prospecting this piece of water for mineral, we determined on the more prudent plan of following up the high ridges of sagebrush. Two hours of fruitless labor and investigation showed that we were still some miles away from the lone house in the desert, and that common prudence dictated pitching camp for the night. A single horse blanket would not be accounted the most eligible hotel accommodations for a wintry night, but plenty of dry sage brush for a good fire rendered our condition one of comparative comfort, and we felt grateful—grateful that we had made a success in fording the lake, and grateful that we were not likely to be visited with frost or snow during the night. This was certainly far in advance of a similar encampment made on the night of the 23d of December, on our way from Mason valley to Carson City, when after driving twenty-five miles to reach a house, we had the misfortune to lose our way in the very dark night, and after adding some ten extra miles to the route, found ourselves finally corralled in the top of a mountain ridge, at a railroad cattle station, where we were compelled to pass the night with neither fire nor blanket, and with a temperature sufficiently low to congeal the earth for two inches in depth. Such mishaps cannot always be provided against where distances between habitations in some parts of the country are so remotely connected. In this State, as in California, with no guide boards at the crossings nor the principal well-worn branch roads, it frequently happens that a traveler, like the one we saw at Reno the day before we left, will start in, as he did at Wadsworth for Stillwater, and bring up at Sutro, fifty-six miles off his route. As it was, a sharp gallop in the morning showed our encampment to have been only four miles from the lone habitation on the border of the desert.

We have been somewhat minute in this description from the important circumstance that on our third day out we equally failed to get correct information concerning our route, and the lack of it enabled us to explore, by daylight, one of the most beautiful presentations of mineral wealth that the eye can survey in this or any other State. This was none of the metals, such as gold and silver, but

Borax, Soda and Salt,

All spread out over a distance of some 15 miles, in the order as stated. Coming suddenly and unexpectedly upon such a rare, rich and extensive display of these minerals, it struck us as one of the most fascinating exhibits that nature can offer to man. The perfectly horizontal plain upon which this deposit of minerals takes place is, as stated, some 15 or 18 miles in length, and varying from two to six miles in width. Having a necessity to cross the plain, where the soda formation appeared to be the heaviest, we followed the waymarks of an old telegraph line, which had been chopped down, but the stumps of which were still visible all along the air-line route. The five miles through this soda camp, with its flour-white coruscations, so strikingly resembling the blooms of dairy clover, with all its green leaves stripped off, uniformly developed to a depth of from five to eight inches, gives a vivid impression of the exhaustless resources of this

much used mineral in the earth. About midway across this alabaster-white soda plain we encountered a running stream, taking through towards the foot of the great valley, and emptying into a shallow lake. Fearing that we had struck a quantity of alkali in solution we scooped up with the hand a spoonful of this pure, crystal fluid, before allowing our horses to dip his nose into it. Of all the brine that we ever tasted, this seemed to be the quintessence. We allowed our animal then to satisfy his eager curiosity, as he had not been able to obtain a drink in a distance of 25 miles. One sniff was amply sufficient, for throwing his nostrils high in the air he gazed peeringly up that pellucid stream, as if to ascertain whence emanated such a villainous, bogus compound for water, and then, with no further ado, ambitiously resumed his wearisome trudge through the soft, deep, snow-white soda bed. Here, thought we, is soda enough for the mill, and salt also, convenient enough to give flavor to all the bread it can make. Mr. Whiteman, whom we came up with, living at Sand Springs, and who, in former years, has furnished large quantities of salt for the mills at Grantville, states that the saline creek which we crossed is from spontaneous springs, coming up from the bed of the plain below, and that the salt lake, which is several miles in extent, is refurnished wherever it is scooped up with fresh layers of loose salt to the depth of several inches. This salt is very pure, and Mr. Whiteman, the only resident 20 miles from all points, has about a thousand tons ricked up ready for use when the war on bimetalism is over, and the mills, which are located at Grantville and Austin, that have shut down on the strength of this hostility and the consequent depreciation of silver, are once more set in motion. The most remarkable feature of this trio of

A Surface Crop of Minerals

Appears to be the segregation of the whole into individual localities, each mineral having chosen, as it were, the principle of squatter sovereignty, i. e., each mineral occupying a territory of its own, with the exception of the salt stream we noticed, and each possessing properties of the greatest native purity. Borax, soda and salt in unmultiplied thousands of tons are here spread over many thousands of acres of land, and each in a field of its own choice. We do not doubt but that this immense bonanza of mineral has been, or rather is being, deposited by surface agencies, but unfortunately for this theory as applied to gold and silver, in this case it is drawn to the surface and not precipitated into the bosom of the earth by any external agency, as has been claimed for that theory by its advocates. The rim of this whole basin on either side for twenty miles is of a strongly, well defined iron and igneous formation. The rock is apparently utterly destitute of all quartz and quartzite, and partakes of something of a desolate and bleak aspect, as may well be conceived. In traversing the alkaline districts of Colorado, Idaho, Utah, Montana, New Mexico and Arizona, we have had occasion to observe extensive deposits of these minerals in the fluid and solid state before, but nothing, hitherto, in any of these territories of country, has met our attention where such a trinity, purity and extent of formation has occurred. Taken as a whole, this entire valley, which lies some forty-five miles southeast from Wadsworth, is a unique mineral floral offering of nature to humanity, of the most surprising character, and which only requires the attention of capital and railway communication to render it an exhaustless bonanza to the operator and an unlimited reservoir of supply to the warehouses and grocery stores of a nation. Minerals that always have been, and probably always will be in active demand, have here a field for their perpetual production, and the cheaper and less expensive their cost in labor the greater the comforts and economy that will be conferred upon the great mass of humanity.

Such, at least, was the nature of our reflections as on the following morning we turned our horse on the top of a four-mile rise and took in at one view the distant perspective of these varied fields of mineral wealth, that were now glittering in the radiant sheen of the morning sun, and mutely beckoning the enterprise of coming generations to gather in their ever ripening harvests.

THE *Arizona Journal Miner* says: Arizona will experience a mining boom the present year that will surpass anything that has ever been recorded in the history of mining. With the prospective raise in the value of copper and the promulgation of the many contemplated mining enterprises throughout the Territory, Arizona promises to lead the van in the production of the precious metals.

THE Marysville foundry is building a five-stamp quartz mill for Tom Green, at French Corral, Shasta county, which is to take the place of a worn-out battery in a mill at that place.

JOS. M. MCGUIRE, with Spruance, Stanley & Co., has bought the Prince mine, at Altaville, Calaveras county, for the sum of \$60,000. There are hoisting works and good light stamp mill on the property.

THE *Shasta Democrat* is of the opinion that during the past year \$300,000 worth of machinery for the mines of Shasta county has been provided.

MECHANICAL PROGRESS.

Selecting a Steam Boiler.

In our contact with engineers, users of steam and dealers in steam goods, says the *Boston Journal of Commerce*, we have often heard very positive preferences expressed for one or another form of engine or boiler. Some would swear by a horizontal return tubular, others would have nothing but a fire-box boiler of the locomotive type, while others, comparatively few but as a class quite numerous, preferred the vertical tubular. Some have tied up "for keeps" to a water-tube boiler, others will hear of nothing but a fire tube; some prefer the tubes numerous and small, others are contented with a smaller number, but must have them larger; some will have a boiler fired internally, some externally, and some even advocate removing the furnace from all contact with the boiler.

When we are questioned as to our preference in the boiler line we always require to know how, where and for what the boiler is to be used. A boiler which will furnish steam with the least expense for fuel and repairs in a New England cotton mill might be the most inconvenient and expensive that could be used in a portion of the country less favored as to water. A boiler which would furnish admirably the low pressure and quantity of steam required for heating purposes, might be entirely at a loss under the higher pressure, and the more intense combustion requisite as a source of power. The locomotive boiler is particularly adapted to its special work. It gives us the maximum of power in the smallest space and with the lightest weight, yet it would hardly be the most economical or desirable boiler, all things considered, for most stationary plants. When a man talks one boiler straight, through thick and thin, for all purposes, and in all conditions, it is safe to conclude either that he has an interest in that boiler or does not know what he is talking about.

Waste of Power.

That coal bills in manufacturing establishments may often be readily reduced by attention to things outside of the boiler-room is evident from the following, which we find in the *Boston Journal of Commerce*:

With high-speed machinery and shafting, driven at 300 turns per minute, it takes but a small resistance to waste a large amount of power. A load of only 10 pounds on a 3-foot wheel will call for one-horse-power from the coal pile, and a light belt left dragging on the pulley will offer more than 10 pounds resistance. The Emerson power scales were recently applied to the pulley where the belt, when thrown off and hung up out of the way, would rest on a short arc on the driving wheel, and it was found that this pulley required more power than was used on the machine it drove when the belt was in motion. Leather has a wonderful clinging tenacity, and wherever it is allowed to drag on the framework or guide bars, or in some of the belt-holes when the belt gets slack, more or less power will be absorbed, though the wear of the belt may not be noticeable. We have seen the set-screw of a pulley slip and draw the shaft along in the bearing till one of the larger wheels rested against a floor beam, the rim cutting into the wood and the beam, making use of the friction break in absorbing power till the line of shafting was brought into place. Belts that have been overstretched by having more work to do than they are able to manage are not apt to run true on the pulley, and where the face of the wheels are no wider than the belt they must not run very close to the framework as the projecting edges of the belt may strike and offer a large amount of resistance. When there are indications of frictional resistance by the room becoming filled with the fumes of belt grease, there is a chance for some one besides the fireman to make a saving in coal, if it is nothing more than to remove the boiler's ladder that is grinding its way into the space between the fly-wheel and brickwork.

IMPROVED BOILER FLUES.—From Germany comes an account of several boiler trials which were recently made with the view of determining the advantages, in point of fuel economy, claimed for a new form of flue. The results were somewhat remarkable and want confirmation. The flue in question differed from the ordinary form in that it was furnished on the outside with longitudinal fins which thus projected into the water and practically offered an increased heating surface. It appears from available particulars that tests with two boilers, exactly similar in design, one of them, however, furnished with plain flues and the other with the flues described, showing a saving in fuel of 34 per cent in favor of the latter, and pointed also to an increased steaming capacity. More complete utilization of the available heat is naturally to be looked for in the use of the new flue, but the figures given are much too high to pass unquestioned, and further investigation should no doubt modify them appreciably. It must also be borne in mind that the fins with which each flue is supplied afford exceptional facilities for the lodgement of mud and feed-water impurities generally, and if the trouble, expense and decreased evaporative

power entailed by the presence of heavy boiler deposits be duly taken into account, it seems probable that the balance of favor would rest with the plain flue. Should the saving, however, really turn out to be as large as that claimed, further examination would be advisable and might serve to bring into use in some places a boiler which, with all its drawbacks, would be a source of profit to its owners.

IMPROVEMENT IN ROLLING MILL TRAINS.—One of the lines in which progress is going on quietly, but with encouraging persistency, is the improvement in the design and in the adjustment of roll trains. Formerly in all mills, and now in a good many of them, the head roller was an autocent, because with his skill in adjusting the rolls he was master of the situation. Now the attention of mechanical engineers and metallurgists has been directed toward so designing the trains that as little skill as possible was needed to do his work. In some instances a point has been reached where a machinist of average intelligence may be relied upon in a few weeks' experience to occupy the place of one who once posed as a tyrant. As in many other departments of iron and steel manufacture, our rail works have led the van of progress. Only too many of our iron makers are behind in this respect. They do not sufficiently appreciate the force of the maxim that "time is iron." Every moment saved in preliminary work means an addition to capacity, and we have heard it stated by one of the leading authorities in this branch of engineering that the trains could be counted by dozens where output could be nearly doubled by modifications and improvements in design. We are doing magnificent work in rail rolling and in some of our plate and wire-rod mills, and it should be a question of only a short time to bring the majority of our merchant mills to the higher standard thus reached.—*Iron Age*.

WOODEN TURBINES.—According to *Iron Age* wooden turbines have of late been proposed to meet the demand for an efficient and cheap water motor for small powers, and there is every reason to believe that within certain limits they will meet with a very favorable reception. Turbines, it must be remembered, have the advantage of being small in bulk for their power, and equally efficient for the highest and the lowest falls, and were it not for the fact that they are constructed wholly of metal their use would probably have long since become more general. Wooden wheels can in some cases be readily procured at a comparatively low price, and, as the question of first cost and ease of repairs enters very largely into the problem of successfully utilizing small water-powers for some purposes, and is of greater importance than a high efficiency, turbines have often been unable to compete with wheels of other types. This state of things, it is thought, can be changed by using wood as the structural material, thus securing the advantages of turbines without their drawbacks, and it has been found that in this way their cost can be reduced to about one-fourth of that of iron turbines. In some parts of Europe wheels of this class have been constructed partly of oak and partly of yew, and the results are understood to have been highly satisfactory in every respect.

A NOVEL RUBBER SPRING.—At a late meeting of the Engineers' Club, of Philadelphia, Mr. Howard Constable described a novel rubber spring for tram cars, railway drawbars, buffers, and the like. It consists of a cylindrical piece of rubber with a hole through the axis, and capped at both ends with bearing plates; the draw-bar, or location bolt, of course, passes through the bearing plates and rubber spring. The peculiar feature is that a steel spring encircles the rubber, so that as the rubber is compressed it is reinforced by an increasing resistance on the part of the steel spring, which tends to hug it back to its original form. It presents some excellent features for long range, endurance, uniformity or gradation of resistance, and freedom from danger in collapse as well as economy. It is being extensively used in England, and one that has been under test by the chief engineer of the North Eastern Railway, has withstood, up to the present time, over 1,000,000 depressions of five tons. A model was shown, and it should be noted that the steel ring is not solid, but laps over itself, so that the ends slide over each other as the rubber presses the spring outward; also that the section of the spring can be U, W, or other shape.

COMPRESSING AND TOUGHENING TIMBER.—By a new process of toughening wood it is claimed that the effect produced upon white wood is such that a cold chisel is required in order to split it. This result is accomplished by a special method of steaming the timber and submitting it to end pressure, technically "up-setting it." By this means the cells and fibers are compressed into one compact mass, and it is the opinion of those who have experimented with the process that wood can be compressed to the extent of some 75 per cent, and that some of the timber now considered unfit for use in such work as carriage building, for instance, can be made valuable by this means as a substitute for ash, hickory, etc. Of course, the process is applicable only to wood in comparatively small quantities, such as is intended for use for tool handles, and carriage or wagon work, etc.

SCIENTIFIC PROGRESS.

How a Trap-Door Spider Builds His House.

An Eastern lady correspondent of *Science*, Mary T. Palmer, recently received a female trap-door spider from California, which she placed in a box of earth, where the spider soon commenced the work of building herself a house after her original Californian model. The correspondent writes: She was found one morning occupying a hole three-quarters of an inch in diameter and deep enough to completely hide her, around which the ground had been cleared and smoothed so that it was somewhat lower than the general level. Unfortunately, as this work was done during the night, she accomplished it unobserved. She probably cleared the ground, however, as she had done on a former occasion, by walking slowly sideways, with all the feet on one side held together, turning slightly at the same time, and sweeping all rubbish and coarser bits of earth before her. In digging the hole she threw the earth to a distance, as was shown by numerous little irregular lumps of earth scattered over some moss farther on the side of the box. Later the spider was seen to dispose of more in the same manner, but it was done so quickly that the exact motion could not be distinguished.

During the day she busied herself in the burrow, apparently treading against the sides in order to make a compact wall. At night she rested, and nothing more was done until the following evening when she commenced to build a straight ridge or rim of earth at one side of the hole. She brought up as much earth as could be carried under the mandibles and placed it on top of this rim. When it had been secured by several strokes of the fangs the spider turned and rubbed the spinnerets over the spot and afterwards all along the edge. The spinnerets were applied directly to the surface, and were used not only to produce the silk but also to smooth and model the edge.

This process was repeated until the rim was about a quarter of an inch in height, when the spider left it and commenced a similar one on the opposite edge of the hole. Here she worked, as before, until she had made a ridge about half as high as the other, when she returned to the first, and during the next hour added to them both alternately. At the end of that time she brought up the first load of earth which was not used in building, and deposited it as far away as she could reach, without leaving the burrow. As she withdrew she turned and attached a line of web to the edge of the second rim, by which it was pulled over the opening after she had disappeared from sight. Henceforth it was necessary to lift and turn back this rim (or flap as it might now be called, to distinguish it from the true door) whenever she came up, unless, as sometimes happened, she had neglected to pull it down.

In the mean time, the first rim, which was to become the true door, had been gradually enlarged; but another hour elapsed before any attempt was made to pull it down. The spider then fastened a line to the upper edge, by which, after a long and steady pull from below, the structure was dragged over the opening, which it only half covered. It was immediately raised and carefully re-adjusted in an upright position. After another half hour, devoted to adding more earth to the two rims alternately, the first was again drawn down; but, being still too small, it was once more returned to the old position, and the work of enlargement continued. As nothing but persistence in this course seemed necessary to complete the door, the spider was allowed to work the rest of the night without supervision.

In the morning the spider had vanished. The entrance of the nest was closed, and the depression around it filled, so that its position was perfectly concealed. Naturally, it was supposed that the door was finished; but the next night proved this conclusion to be erroneous. When the spider was visited at 3 A. M., the door covered only three-quarters of the opening, and she was still employed in adding earth to the edge. During the day the entrance had evidently been closed by the true door and the flap, used together as a double or folding-door, one side being much larger than the other. The flap, no longer needed as a cover, was now turned back and pushed away, the opening thereby being considerably enlarged. More earth was subsequently placed over and around it, until it was completely hidden, and rendered useless. Before morning the true door had attained the necessary size, and the lining had been added to it; but the lining of the burrow was not entirely completed until some days later.

A piece cut from this door showed it to be a layer of earth with a single lining; while an old nest which came with the spider, and which she presumably made, was provided with a door having nine linings, each of the eight lower ones enclosing a rim of earth, by which the door had been enlarged.

A PREDICTION AND ITS FULFILLMENT.—Florence, the actor, was once in a company where Morse, the telegraph inventor, was also present, and in quite a talkative mood. Of course, he was very enthusiastic over his own great invention, and in the course of his remarks said: "Some day men will be able to talk over the

wires for distances of 50 miles, and every ship on the ocean will, in effect, be connected with the land by wires." If the entire prediction has not been fulfilled, recent discoveries in electricity have come very near it, for it is quite well settled that passing ships may now talk with each other by means of trailing wires, which is almost like being connected with terra firma.

Relative Strength of Wet and Dry Timber.

In reply to a statement by the *American Miller*, that "wet timber is not as strong as dry, in some cases it has not half the strength of dry," a correspondent of that paper writes as follows: "In September, 1876, the Lanesboro mills, Lanesboro, Minn., burned, and that fall we rebuilt them and began making flour the next March. We used sawed pine (taken out of the Mississippi river) for joists, 3x12 inches, 12 feet long, and sized them, laying them on top of the girders, to get their full strength, and then used 4-matched flooring. The joists were placed 12 inches from center to center, leaving 9 inches between them. In the fall of 1877, we piled wheat on the floor 26 feet deep in the bins, and the joists, yet wet and green, only sagged a trifle, and carried the immense weight safely. Two years later the same joists were dry, from the heat of our very large stove. We loaded the floor with 24 feet of wheat and six joists broke off nearly square in the middle, and others were cracked. In the first instance the bins held 360 tons of wheat while the joists under them were green. When the joists were dry 300 tons or less broke several of them. This shows that green pine is stronger than dry pine, as the wood becomes brash or brittle by drying and is not as strong as when green. This is caused by the sap drying and leaving only solid matter in the capillary tubes, and they cannot move one on another, while if the timber is green the tubes are full of water and can bend or move one on another. I know of but two kinds of wood that are stronger dry than green, and they are maple and white oak.

INSECT INTELLIGENCE.—An account of a singular habit in the cicada (locust) is related and illustrated by J. S. Newbury, in the *School of Mines Quarterly*. A cellar had been dug and house built at Rabway, N. J., a short time before the appearance of a brood of cicadas. The unused cellar was opened about the time of their advent, and the bottom was found thickly covered with mud cones or tubes from six to eight inches high and an inch or more in diameter, each of which had been formed by the pupa of a cicada that had emerged from the earth beneath the cellar. The undeveloped insect finding itself in a dark place, and apparently desiring to work up to daylight, had taken the moist clay and formed it into pellets with which it had built up the tubes, apparently with the purpose of bridging over the darkened vacancy and thus reaching daylight. The tops of all the cones were closed, but on breaking some of them the pupae were seen both in the hole in the ground and in the cone. After the cellar was opened and light admitted, they stopped building and made holes in the tops of the cones for exit. The author further remarks that in these facts there is evidence of the exercise of intelligence in the cicada, and a judicious adaptation of means to an end in circumstances that, it would seem, must have been without precedent in the experience of that or any preceding generation, and therefore for which no education of ancestors could have given a preparation. It is possible that the pupa of the cicada is sometimes embarrassed, in its ascent to the surface by water, by too wet or too dry sand or mud; but it is hardly possible to imagine circumstances where the construction of a tunnel would be necessary. There seems to be no adequate explanation of the phenomena that will bring them within the scope of the theory according to which all our organs and faculties are the result of formative influences progressively developed through a long line of ancestors.

SENSE OF SMELL IN INSECTS.—Professor Graber has made an extensive series of experiments on the degree and localization of the sense of smell in insects, etc., from among the results of which the following will be found of interest: Odors are perceived by many invertebrates, such as mollusks, insects, etc., with extreme rapidity, sometimes in one-third of a second, and even through an intervening layer of water a half-millimeter in thickness. Insects deprived of their antennae are still able to smell, but in varying degrees in different insects and for different odors. In some cases the palpi of the mouth organs are more sensitive than the antennae, and therefore the latter cannot be considered as being alone the organs of smell.

PHOTOGRAPHY IN MEDICAL PRACTICE.—Some novel and interesting applications of instantaneous photography to the study of the movements of the heart and intestines have recently been made by Dr. W. G. Thompson. Photographs of rabbits', pigeons', cats' and frogs' hearts were made, showing the action more clearly and accurately than is possible by other methods. In addition to the value of such in physiological teaching, the most practical application of the method will be the illustration of the changes in the form of the heart and intestines produced by drugs.

TABLE OF CONTENTS.

EDITORIALS.—Steam Laundry Machinery for White Labor; The Alaska Mines; The Mechanics' Institute, 221. Passing Events; Opening Deep Mines; No Danger of Overproduction; Cooling of Lead Slags; Mining Accidents. 224. Silver and Gold from Black Copper; A Storm Shield Dress; Foundry Notes; Pump and Engine, 225.

ILLUSTRATIONS.—Chartrey's Improved Steam Washing Machine; The Horizontal or Box Mangle, 221. Storm Dress for Ladies; 15-inch Pump and Engine for Low Lifts, 225.

CORRESPONDENCE.—Dillon, Montana; Nevada—Bonanza on the Surface, 222.

MECHANICAL PROGRESS.—Selecting a Steam Boiler; Waste of Power; Improved Boiler Flues; Improvement in Rolling Mill Trains; Wooden Turbines; A Novel Rubber Spring; Compressing and Toughening Timber, 223.

SCIENTIFIC PROGRESS.—How a Trap-Door Spider Builds His House; A Prediction and Its Fulfillment; Relative Strength of Wet and Dry Timber; Insect Intelligence; Sense of Smell in Insects; Photography in Medical Practice, 223.

USEFUL INFORMATION.—Schmitt's Rubber Oil for Leather; Burning on Stuff; Asbestos Plaster; Cause of San Francisco Fog; A Hundred-Year Old Steam Engine; An Inmate Possible; Saving; The Greatest Lumber Market in the World; Silk Spinning and Weaving; The Japan Patent System; Petroleum Fuel on an Ocean Steamer, 227.

GOOD HEALTH.—Something About Bathing; Ignorance Regarding Hydrophobia; How to Get Strong; How We Spoil Our Lungs, 227.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Montana, Idaho, Utah, Colorado, Oregon, Washington, New Mexico, 228-29.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 232.

Business Announcements.

Passing Events.

Spring has now fairly opened and the miners who have, in the higher parts of the coast, been in the camps and towns all winter, will now be able once more to start on their prospecting trips. This promises to be quite an active mining season, more particularly in the northern part of this State, which, for years, comparatively neglected, is now coming to the front once more.

The capture of Geronimo and his Apaches, by Crook and Maus, and his subsequent escape with his braves, again directs attention to the Indian question in Arizona. As long as these marauding Indians are at large, portions of that region must be unprospected. Their presence now prevents immigration and retards mining development in the region they infest.

The excitement about gold on the Yukon and Stewart rivers, Alaska, is a renewal of that of last year, though so far, little is known of the richness of the region, aside from vague reports.

The low railroad fares and freights continue, and hundreds of tourists are coming to California, many of whom will settle here. Opportunity is also given to ship East our home products. Among other things, chrome ore is now being forwarded by rail to Baltimore, so that mines formerly of little value are worked to a profit.

Opening Deep Mines.

In the volume on "Precious Metals," of the census reports, in discussing the questions concerning the development of deep mines, a table is given showing the manner of opening deep mines, in the various States and Territories. Without quoting this in detail it will be of interest to take the totals of the various methods. The officers report on 920 mines. Of these 195 are opened by shaft; 86 by incline; 91 by shaft and incline; 202 by shaft and tunnel; 40 by shaft, incline, and tunnel; 1 by shaft, incline, and open cut; 12 by shaft, tunnel, and open cut; 2 by shaft, incline, tunnel, and open cut; 151 by tunnel; 49 by tunnel and incline; 20 by tunnel and open cut; 6 by incline and open cut; 3 by incline, tunnel and open cut; and 50 by open cut alone. Of the 85 California mines, 23 are opened by shaft, 17 by incline, 9 by shaft and incline, 7 by shaft and tunnel, 21 by tunnel, 7 by tunnel and incline, and 1 by shaft, incline and tunnel. Most of the work is by shaft, or tunnel, and the majority by shaft and tunnel.

Opening a mine by a tunnel involves the expenditure of less capital than sinking a shaft. It is therefore the natural system of prospecting where practicable. Before mining machinery had reached the perfection which it has attained during the last few decades, it was often the only practicable method of draining and working even large and profitable properties.

Of late years, however, this method of opening mines has been less and less practiced all over the world. The cases reported in the table quoted as opened by shaft and tunnel, are seldom those where tunnels have been run for drainage, but almost always those which have been opened as prospects by tunnel, a shaft having afterward been sunk; and the figures show that less than a quarter of the whole number of mines are practically worked by tunnel.

In Nevada, where deep mining is carried to a greater perfection than in most of the States, only one-sixth of the mines are worked by tunnels. Had the standard of mines reported on been lower, the proportion of tunnel mines would have been far greater, and *per contra*, had the standard been higher, there would have been a greater proportion of shaft mines.

In very small mines an incline is sometimes sunk on the dip of the vein for prospecting purposes, but these are usually only temporary. In larger mines, those for example on the Comstock lode, an incline is often run on the dip of the vein from the bottom of a vertical shaft, when for any reason it is undesirable to penetrate the footwall. This method, however, has many inconveniences, and of late many engineers prefer under such circumstances to crosscut into the hanging country rock to a suitable distance and sink a blind shaft vertically to a lower level. This hoisting is then done by compressed air. Open cuts, except for prospecting purposes, are very rare. In Idaho, however, the Custer and other mines show large bodies of quartz exposed by erosion, and are therefore capable of this simple method of working.

Another table, interesting in this connection, is that showing the extent of workings. Out of 825 deep mines reported upon, the total length of shafts and inclines aggregated 399,686 feet; total length of tunnels and galleries, 1,992,191 feet; winzes and upraises, 221,071 feet; greatest vertical depth of workings, 3027 feet; greatest horizontal development, 4000 feet. The totals in miles, neglecting fractions, would be as follows: Total length of shafts and inclines, 76 miles; tunnels and galleries, 377 miles; winzes and upraises, 42 miles; total, 495 miles. The tunnels and galleries include all horizontal workings known as adits, levels, tunnels, drifts, crosscuts, etc. Nevada leads all others in this table, having 119,547 feet of shafts and inclines, 794,914 feet of tunnels and galleries, and 100,133 feet of winzes and upraises. She also shows the greatest vertical depth and greatest horizontal development.

The shafts have from one to five compartments, and these are from 3 by 4 feet to 6 by 7 feet in the clear. The tunnels vary from 3½ by 5½ feet to 12 feet by 9 feet in the clear.

The census officers think that the totals we have quoted represent three-quarters of the entire length of mine workings of the country which were in operation in the census year. Taken together, the tables indicate the extent of the mines, all of which, it must be remem-

bered, have been opened within about 25 years, and most of them within a shorter period.

Except on the Comstock there are no mines over 2000 feet in depth, and thus there are some over 3300 feet. The Adalbert shaft, at Pribram, Bohemia, is 3350 feet deep. But while mining on the Comstock began in 1859, the Pribram mines were opened in 1527, and have been worked more or less actively ever since.

On the Comstock mines the length of drifts, crosscuts, shafts, inclines and winzes aggregate over 185 miles. On that lode the average size of drifts is 6x7 feet; average size of single winzes, 6x7; average size of double winzes, 12x7; average size of shafts in the clear, 5½x15; area of excavation of the Forman shaft, 8½x28; area of excavation of the Combination shaft, 9x28; area of excavation of the Yellow Jacket new shaft, 9½x23; area of excavation of the Oshiston shaft, 8½x23; average area of excavation of the old shafts, 8x20 feet.

No Danger of Overproduction.

There is one product of California, at least, in which there is no danger of overproduction—that is gold. Being a standard of value all over the world, more or less annual yield does not affect it, and even when discovered in unusual quantities it is not depreciated. This State has the most productive gold fields of the whole world, and notwithstanding this comparatively decreased yield of late years, still maintains the leading position. California yields more gold every year than all the other States and Territories put together, and exceeds Australia, Africa, Brazil and Russia.

But Californians have been so accustomed to this, and take it so much as a matter of course, that many of them are too apt to consider it of comparatively little importance. Because fortunes have been lost in the stock jobbing operations of silver mining, they are apt to class all mining in the same category as speculative and uncertain. And with this feeling prevalent they neglect the opportunities at their very doors, and permit to lie undeveloped ground which in other countries would be immediately prospected and worked.

But there are men who realize the advantages they derive from living in a gold-producing country like this, and who invest their money in opening mines. Many of them have made, and are making, fortunes from their enterprise. Moreover, observing men who have of late come to our shores see on many sides opportunities which have been neglected by our own residents, and are taking advantage of our apathy. Eastern people are now putting money in our gold mines, and re-opening old ones which had been abandoned. In San Diego county, for instance, up in Julian and Banner districts, in the Cuyamaca mountains, Eastern people have taken hold of claims which had been abandoned, and by putting in their money wisely have brought them to a paying basis.

The truth is our quartz mining industry is in better condition to-day than it ever has been. The cessation of work on the hydraulic mines has caused attention to be turned to quartz, and the depressed prices of silver, lead and copper have made mining men look up the gold fields. All over this State quartz mines are being opened and developed. Every successful one draws attention to its locality, giving opportunities for other mine-owners near by to dispose of their prospects.

Cooling of Lead Slags.

The more slowly a newly-drawn pot of slag is cooled the more perfect will be the crystallization. Such slowly-cooled slags have a certain fixed fusing point, and are generally only imperfectly soluble in any of the strong mineral acids. The slag upon breaking open a pot ordinarily shows a well defined crystallization when the type is closely approached, and on the outer edge there will be a thin crust or scale of glassy material. If slags are cooled rapidly the crystallization will be imperfect, and if very rapidly the structure is entirely changed and often crystallization is entirely absent. If melted slag is either poured or plunged into water, the crystallization is entirely prevented, and the mass (if not in too large quantities) will show a glassy appearance not unlike obsidian. Slags thus rapidly cooled have suffered a very remarkable and hitherto unrecorded change;

they will be found to have a much lower fusing point, and by powdering them they will be found to be entirely soluble in any of the strong acids, especially in hydrochloric acid. By taking advantage of the last named fact it will readily be seen that fusions for the analysis of slags are entirely unnecessary in connection with this industry.

It is generally customary at lead smelting works to turn a stream of water on the slag trough or "slag runway" soon after tapping a pot of slag, thus chilling and rendering brittle that portion which has adhered to the trough, and this is almost always thrown away, injudiciously as is thought by Mr. M. W. Iles (in a chapter on the subject in the "Mineral Resources of the United States," since this portion will not only contain many matte globules but also very often pellicles of lead which may have lodged upon the trough, either from a "blow pot" or from a leaky breast. This rapidly cooled slag is not only generally richer, therefore, than the main body of the slag, but, if for no other reason, it should be saved for these uses: It melts at a very low temperature and hence is valuable for "blowing in" a furnace; to be fed after "harring the hangings," and it also serves a most admirable purpose in keeping down or preventing the so-called "over fire" or "fire top."

Mining Accidents.

Mr. Geo. Felmeth, while working at the Zeile mine, Amador county, fell down the shaft a distance of about 50 feet, and was quite severely bruised up, but fortunately his injuries were not of a very serious nature. It is considered almost a miracle that he escaped with his life.

It used to be a very common accident to have the cage drawn up into the shieves, but of late years more precautions are taken around the hoisting works and we do not so often hear of injuries from this cause. At the Anaconda mine, in Montana, however, the other day the cage was drawn up into the shieves and Jerry Mullen killed and W. J. Elmer seriously injured. Mullen was head blastman and Elmer station tender at the 300-foot station. The blastman had gone down to the 1000 foot level and fired a series of holes, in the usual manner, with an electric battery, and after the smoke had cleared away he and Mr. Elmer went down to the station and gathered up the wire attached to the battery, placing that and all of their other appliances upon the upper deck of the cage. Mullen gave the usual signal to hoist to the 300-foot level, which was done by the engineer, and after a pause of a couple of minutes, the latter states, the hell was again rung, indicating that the men desired to be hoisted to the surface, and they were started up. The dial of the indicator is traversed by the finger in making 800 feet up or down the shaft, necessitating a lap for the other 200 feet, and the engineer made the fatal mistake of supposing that the men were at the 1000-foot instead of the 300, and when he started his machinery in motion he stooped down to adjust a lubricator. He only took a few seconds, and as he raised up to his throttle the cage shot up out of the shaft and into the shieve before he could check it. Both men were thrown out to the floor below, a distance of about 50 feet, Mullen striking flat upon the iron plates, while Elmer was thrown into one of the empty cars standing there. The brakemen and carmen rushed to their assistance, while the engineer, Hassinger, at once left the works, probably fearing bodily harm at the hands of the miners, whom he knew would be greatly incensed at the result of his carelessness.

There is a lesson in this accident for other mine managers. The engineer, at the inquest, testified that he hoisted the cage from the 1000 foot level to the 300; he then after awhile heard three bells, which means hoist men to the surface. When he started the engines he supposed the cage was at the 1000-foot level, but it was at the 300-foot level. He looked at the indicator needle and it was coming by the 1000 mark, so he thought it was all right. The jury returned a verdict that "the said Jerry Mullen came to his death by being thrown from the cage on the west shaft of said mine in consequence of the engineer, H. B. Hassinger, not having observed the situation of the cage as noted by the indicator, and we believe the accident would not have occurred had the indicator registered 1000 instead of 800 feet."

Silver and Gold from Black Copper.

No. 4. The Silver and Gold Residue.

The mud which settles is composed of some subalts and both silver and gold in a fine state of division. The mud, after two or three operations is washed out through the pipe into two vats below, one meter square and 1.50 meters deep. When enough is withdrawn it is pumped by steam through a filter press with six filters in each press and washed with water in the press. The cakes are dried and sent to the silver works. They contain most of the gold, from 2 to 4 per cent of silver, with some gypsum, and the oxides of lead, arsenic and antimony.

Crystallization of the Copper Sulphate.

As soon as the liquor has settled it is siphoned off to the crystallization vats on the floor below. There are twelve of these vats to each solution tank. They are all lined with lead. One tank full fills a vat, and one vat is emptied of its crystals each day, so that the liquor remains 12 days in each vat. There are 36 of these vats. They are built two together, and supported on the sides and bottom by braces 0.15 meter square and held by iron rods at the top. They are 3.75 meters square and 1.05 meters deep.

On the top of each of these vats are 25 poles with five strips of lead, .004 meter thick and .002 meter wide, hung on them and reaching to the bottom of the vat. Here liquor is allowed slowly to crystallize. The largest crystals collect on these strips, the next on the sides of the vat. On the bottom small crystals often collect, which are taken out with a scoop and recrystallized. When the crystallization is complete the mother liquor is drawn off to be used again in the solution of the copper and of the first copper crystals. The crystals are collected from the strips first and then from the sides. When taken off they are put down on one corner of the vat until they are all collected. They are washed with water and are dried in a large room which is kept as dark as possible to prevent the decomposition of the crystals. This room is kept heated at 20° R. This is considered essential, as copper sulphate easily loses part of its water, and then becomes opaque. As the only judgment of the quality is by the eye, this makes them look badly, so that they are not easily sold. There are three shelves around the room for drying the crystals, each of which is two meters wide. The highest shelf is two meters above the ground. The crystals are first carefully sorted. The large ones are sold, the small ones kept for use at the works. They are arranged in doubly inclined rows at right angles to the edge of the shelves, so that they can be easily turned over to dry them. Three categories of crystals are made, two of which are sold. They are arranged mostly as to size. They are packed in barrels which weigh 250 kilograms and kegs which weigh 50.

In the course of the process it is found that every kilogram of granulated copper produces 3.80 kilograms of blue vitriol. It requires for its solution 2.40 kilograms of sulphuric acid at 50° B. Six solution tanks, two boiling vats, and 24 crystallization vats can produce from two and a-half to three tons of blue vitriol in 24 hours. The injectors are all of lead with the points made of hard lead.

To use this process it is necessary that the copper should be nearly free from iron and nickel, as these metals concentrate in the process and would at least injure the quality of the metals unless there is enough of them to make a special treatment for them with the concentrated liquors; that sulphuric acid should be abundant and cheap, and that there should be a ready sale for the copper sulphate crystals. The presence of small quantities of arsenic, antimony, and lead does not interfere with the process, and it is therefore applicable to very impure black coppers, or to those which are very rich in silver and gold.

As the acid mother liquors are constantly used over again there is but little loss of sulphuric acid. Most of what does not go into the copper sulphate is used again. These mother liquors can, except in the cases mentioned, be used indefinitely. This process is simple, requiring but little intelligent labor.

About 200 tons of the steel plates for the platform of the dry dock now building by the Union Iron Works has arrived, and the remainder is well on the way. Work is being prosecuted vigorously, and it will only be a question of a short time when vessels can dock and repair in it as cheaply as at other ports.

A Storm Shield Dress.

We recently noticed in these columns the issuance of a patent through the Mining and Scientific Press Patent Agency, to Mrs. Maggie Boyd, of Riverside, and now give illustrations of the invention. This novel storm shield, head umbrella and skirt protector, as it is termed by the ingenious inventor, consists of a body piece or cape, the lower portion of which fits across the back, and has an extension hanging down a short distance behind, so as to cover the rear upper portion of the skirt. The

STORM DRESS FOR LADIES.

front portion of this cape is brought together and secured around the neck, and it has secured to it the breast piece, which extends downward across the chest of the wearer, and has the lower end secured to the front of the skirt by clasps. The chest piece is lined with woolen

tension of the same material of suitable length, the end of which is folded and provided with fastenings, to be secured to the under or flannel skirt, when in use. The skirts are then all enclosed within this protecting extension, and are prevented from becoming wet or muddy while walking. When this device is not in use, it is clasped to the water-proof skirt and secured, so that the whole device would lie outside of the ordinary dress skirt.

This device is indorsed for its health-giving and health-protecting properties. It is a complete shield against wind, rain or hail storms, and the wearer can walk miles and be kept snug and dry.

The ladies or children who wear this over-dress are completely protected, yet they have plenty of ventilation. The chest is covered and the veils are held tight on the inside of the breast piece, so the rain cannot touch the face, and in winter this piece is lined with woolen, so the fingers never get numbed as in holding an umbrella. It is made of the odorless India rubber gossamer, and the hood or umbrella is lined with all shades to suit the complexion and can be worn over the most stylish costumes and not injure them. The hood does not fret the neck like the old style. The umbrella or hood is folded in a pretty shape and the dress is laid in one side and clasped together by a cord, and attached to chain with clasps, and worn at the side as a satchel. The device is quite ingenious and useful, forming a very sensible addition to a lady's wardrobs.

Pump and Engine.

The engraving on this page represents a 15-inch centrifugal pump, with high speed engine, directly connected to the pump, thereby dispensing with expensive belting or gear. This class of engine is particularly suited for steamer use, by reason of the small floor or deck space

15-INCH PUMP AND ENGINE FOR LOW LIFTS.

or other fabric, and the lower edges of the cape are drawn across the outside of the front and secured by rings in the lower edge of the breast piece. This prevents any entrance of rain or wind.

The head piece is composed of rigid extension pieces, similar to those used for an umbrella. Around the interior and front of the umbrella and secured to the lower edge are veils, each one crossing over the head on opposite sides and passing through a ring, by which it may be drawn down to form the hood. These ends pass around under the chin, and may be tied there so as to secure the umbrella in place and prevent its being blown off by the wind. The veil may be held in front.

The skirt portion is secured around the waist, and drops over the ordinary skirts or clothing which are worn, and it has at the rear an ex-

occupied. The shaft of the engine is made of steel, and the connecting rods of bronze. The cylinders are jacketed, and every precaution taken to save steam and cost of running. All working parts are made easy of access, and can be easily duplicated when worn out.

The pump is so arranged that it is firmly secured to the same bed-plats as the engine, thereby forming one solid structure, enabling this engine to dispense with heavy and expensive foundations. Hand-hole covers on each side of pump give easy access to interior of pump for examination of runner, or removal of foreign matter. The suction and discharge pipes can be made to suit any desired position. This type of engine and pump is made by the San Francisco Tool Company. One of them is now doing very good service at Rough and Ready island, below Stockton. The plant is

intended for low lifts, and has a capacity of 10,000 gallons per minute. These pumps are well adapted for irrigation, drainage and water works, and can also be used in surface or river-bed mining operations, or such places where large quantities of water have to be handled at a short lift.

Foundry Notes.

The Pacific Iron Works report a very considerable demand for mining machinery, with a more encouraging outlook than for some time past. Among their more recent shipments are a ten-stamp dry crushing roasting mill for the Gonzales Company at San Antonio, Mexico; a ten-stamp gold mill for Tehuantepec, Mexico; a 20-ton roller mill for Querobahi, Sonora, Mexico; a ten-stamp gold mill for the Southern Belle mine of Arizona; a 30-ton smelting plant, revolving dryer, etc., for the Trinidad Company of Sonora, Mexico; a revolving dryer for the Ventanos Company of Durango, Mexico; a gold mill for Chili, equipped with Duncan concentrators. Also large shipments of these machines to various parts of Central America, South America, Mexico, as well as to various points in California, Arizona, Oregon and Washington Territory. The success that has attended the introduction of the Duncan concentrators in the more prominent mining districts of this as well as many foreign countries, indicates it to be a saving appliance for working base ores of practical value and utility.

The Pacific Rolling Mills, of this city, are now making a specialty of constructing the iron work, etc., of the road bed of cable roads. Not long since they rebuilt the western section of the California street cable road, doing the work without interfering with the regular traffic over the line. They have also done this class of work on other roads, and now have a contract on the new Oakland cable road, from Seventh and Broadway out San Pablo avenue. The road will be a double track and the cable five miles long. Some 4000 barrels of Portland cement have already been purchased and stored, and as much additional will be required. The road will be of steel and concrete. The steel yoke is bent to support the chains upon which the wheels rest. Against this yoke, inclined at an angle, will rest two braces, riveted, and strengthening the slot through which the grip passes to grasp the cable. Between the yoke and the braces concrete will be packed, thus forming a solid and immovable foundation for the pavement. These yokes and braces will be placed at intervals of three feet six inches throughout the entire length of the road. Power will be furnished by two Corliss engines, each of 400-horse-power, and both of the latest and most improved pattern. Only one engine will operate, however, the other being held in readiness for use in case of accident. All this material is ready for the road, and much of it is already on the ground, 100,000 feet of lumber having been purchased for the construction of the necessary buildings and sheds.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 252 Market St., S. F.

- FOR WEEK ENDING MARCH 23, 1886.
- 338,629.—VERMIN EXTERMINATOR—F. E. Browne, Los Angeles, Cal.
 - 338,395.—WHEEL PLOW—M. G. Farnham, Germantown, Cal.
 - 338,591.—PUMP—J. P. Ford, Frazier, Cal.
 - 338,401.—GATE—M. B. and W. Y. Gordon, Davisville, Cal.
 - 338,402.—TOOTH BRUSH HOLDER—N. W. Griswold, Alameda, Cal.
 - 338,353.—FAUCET—D. & T. Morris, S. F.
 - 13,120.—TRADE MARK—J. J. Mack, & Co., S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

SETTLER'S GUIDE.—Henry N. Copp, the land-lawyer of Washington, has just issued the tenth edition of his "Settler's Guide." It is a useful book for all who are, or expect to be, interested in public land. A chapter, illustrated with numerous cuts, shows how to tell township, section, and quarter-section corners, and explains the system of surveys. It gives Commissioner Sparks' orders and several late decisions and instructions, and full information about the homestead, pre-emption, timber culture, desert land, and other laws. The price of the book is only 25 cents.

PRACTICAL HYDRAULICS.*

In this table, opposite the "hydraulic mean depth" as determined, in the column headed by the given fall per mile, will be found the velocity sought. Multiply the velocity so found by the area of the cross section of the stream for the discharge.

Ex. 102.—The side of a square flume of unplanned plank is 3 feet, the fall per mile 4.752 feet ($s=.0009$), and the coefficient of roughness of its bed, $n=.012$.

(See Table 26). What, per second, is the velocity, and what the discharge?

Cal.—In Table 28, find in "side" column for a square flume or canal, 3 feet; opposite which, in "area" column, is found 9 square feet, and opposite which, in hydraulic mean depth column, is found 1. Turning now to Table 27, computed for coefficient of rough-

ness of bed, $n=.012$, find in hydraulic mean depth column 1.; opposite which, in velocity column, for the given fall $F=4.752$ ($s=.0009$), will be found the velocity sought, viz:

$$v=3.82 \text{ feet.}$$

Then $q=3.82 \times 9=3$

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BRIDGE WALL.—Joseph Eoright, San Jose. No. 337,941. Dated March 16, 1886. This patent covers improvements in the bridge-wall or fire arch of steam boiler furnaces. The invention consists of pipes supporting the fire arch and communicating at one end with the water space, and projecting outside with the furnace at the other end, each of said pipes having a separate and individual pipe connection with the boiler. It consists further in making the joints between the bridge-supporting pipes and their connecting pipes exterior to the furnace, and in a peculiar method of construction.

WATER-LEVEL INDICATOR.—Joseph R. Wilcox, S. F. No. 337,910. Dated March 16, 1886. The device is for indicating the level of water in a reservoir. It is a tube or pipe containing quicksilver. It is bent at its lower end and provided with an enlarged chamber, with the top of which the water main or pipe therefrom connects. At its other end is an enlarged chamber, with which a graduated glass tube of small diameter communicates, said enlarged chamber and graduated tube containing water. The object of the invention is to provide a means for accurately and conveniently indicating, in an apartment or place at a point much lower than a distant reservoir, the level of water in said reservoir, and to make the indications very plain or discernible.

EXERCISING MACHINES.—Bernard Farley, S. F. No. 337,942. Dated March 16, 1886. This belongs to the class of exercising machines for gymnastics or private use in which weights are alternately raised and lowered for the purpose of developing the muscles. The invention consists of an outer casing, a vertically adjustable frame in the casing, and a peculiar arrangement of purchase-ropes passing over suitable pulleys on the frame, and adapted to raise and lower sliding weights, said ropes being provided with handles by which they are operated. It consists further in a novel mechanism by which a record is made of the work performed on an adjustable hackrest, adapting the machine to be used for exercising a pushing force and in a novel arrangement of guide-pulleys by which the ropes can be continued and guided to adapt the machine for use with the sliding seat of a rowing frame. The object of the invention is to provide a machine which can be used to exercise the pulling muscles, the pushing muscles, and those muscles which are called into action in rowing.

THE ANNUAL STATISTICIAN.—L. P. McCarty has issued his "Annual Statistician" for 1886. This work may be considered standard and gradually increases in size and value each year. The new matter and corrections of the present volume have been obtained by direct correspondence all over the world, and exceed both in quantity and variety (not to mention correctness) any previous edition. The "Statistician" for 1886 contains 648 pages (the largest yet issued), over 125 of which are entirely new, and over 500 so corrected that they become new. Many new features have been added in this edition, not least of which are its illustrations, four in number, two of which, viz., "The Flags of All Nations," and "The High Domes, Columns and Spires of the World," are colored plates. A cut of the Washington Monument occupies a whole page, including complete statistics regarding the same. The fourth illustration is a full-page cut of the Hon. Leland Stanford, U. S. Senator from California, followed by five pages regarding his unprecedented gift of over \$5,000,000 worth of property endowing a university in this State. The present is the tenth annual edition, and although many pages have been set aside from the previous edition, to give place for new matter, the present volume is much larger and contains an aggregate of over 200,000 facts, of which at least \$50,000 are mathematical (consisting of over 2,000,000 figures). Under the head of "This and That," over 100 subjects are treated in bulk, and including the inventions, discoveries, organizations, public schools of the U. S., chronology of important events down to Jan. 13, 1886, etc. As the name implies, the book is one of reference, and is useful in every library.

Steps have been taken to develop more actively the supply of petroleum that lies in the subterranean basin across Los Angeles county from west to east. A portion of La Brea rancho has been leased by Messrs. Stewart, McDonald, Irving and others, for the purpose of boring for oil, and the lumber and machinery are already on the ground for that object. Operations will commence at once, with fine prospects of success. By the lease these gentlemen can have on 500 acres of La Brea. In Petrolia, 25 miles east of the city, active work is going forward in sinking wells, under the direction of Mr. Burdett Chandler. Two wells there are producing oil at present, and more will soon be added to these. The Puente wells are turning out oil abundantly.

The oldest frame house in Oregon was built in 1842, and still stands as a monument to the skill and industry of the pioneers of that State.

USEFUL INFORMATION.

SCHMITT'S RUBBER OIL FOR LEATHER.—A compound composed of gutta percha, cotton seed oil, and codfish oil in combination with cocconut, pomogranate rind and an aromatic, has been patented by Adam Schmitt, of New Orleans, La. The method of preparation is peculiar but inexpensive, and the resultant compound is used to oil leather to render it smooth, impermeable and elastic. The compound has no disagreeable smell, which is a common objection to many similar preparations. Its special qualities make it the very best oil for boots, shoes and harness, and all kinds of leather goods requiring oil. Leather treated with this compound at once becomes soft, pliable and water-proof, will not turn red, and increases the heat non-conducting qualities, making it especially adapted for boots and shoes. Vermin will not eat leather that is filled with it, which is a quality of great value to dealers and manufacturers of leather goods. The compound has been highly recommended wherever introduced, and is warranted to satisfy the most critical. We would give in this connection what is said to be an excellent recipe for a preparation for a harness cleaner and oiler. Take two ounces mutton suet, six ounces beeswax, six ounces powdered sugar candy, two ounces soft soap, and one ounce indigo or lampblack. Dissolve the soap in one-fourth pint of water, then add the other ingredients, melt and mix together; add a gill of turpentine, lay it on the harness with a sponge and polish off with a brush.

"BURNING ON STUFF."—Burning on stuff is a new, just as amusing as repaying, work, and is done in much the same manner as burning on wood. Short napped goods, such as cloth, especially velvet, are the best suited for the purpose. These burnt patterns have an original effect and can be made useful for a variety of things for ornamental cushions, covers, chairs, etc. At first the pattern is marked on the material and a small apparatus is used. It consists of a bottle filled with benzine and provided with an India-rubber tube. A hook enables the worker to fasten the bottle to the belt of the dress. The lower part of the tube is held in the left hand, while the upper part, ending with a platinum-pointed pencil, is taken in the right. Pressure on the ball forces the benzine into the pencil, which is heated by a spirit lamp or candle previous to going over the marked-out pattern with it. One must be very careful to try whether the point is not too hot. By more or less heavily pressing with the same a great variety of effect can be produced—sometimes a deep, dark furrow, sometimes a faint line, according to what design requires. By a skillful manipulation of the surface of the stuff near the outlines the drawing can be shaded lighter or darker, and the work made into a charming production.

ASBESTOS PLASTER.—Efforts have been made for several years to produce a fire-proof plaster for buildings. As heretofore used, the wooden lathing has rendered ordinary plastering objectionable. Metallic laths, even, do not seem to answer such a desirable substitute as to fill all conditions. A plaster has of late been made of asbestos, silicate of soda and potash, and without lime or hair, that answers very well. The chemical action of the ingredients forms a hard, stone-like substance, having great cohesive and adhesive qualities. So great is the latter quality that the plaster requires no key or hair to hold it firmly in place, even on the smoothest surface and in building. When it is put on iron surfaces, the plaster being an alkali, it has a tendency to produce rust. The adhesive quality of the plaster is such that it will stick so firmly to a plain surface as to require the use of a chisel to separate it from the metal. This plastering can be laid in the coldest weather. If this new material is all that its friends claim it to be, it is certainly something very valuable.

CAUSE OF SAN FRANCISCO FOOGS.—Prof. Davidson says that the water at the Golden Gate entrance of San Francisco harbor, from a mean of ten years' observation, shows a lowest temperature for the month of January of 50° 49' F., and the highest for the month of September, 59° 68' F. The average range is thus only nine degrees, and the extreme range has only been 13 degrees. The temperature of the air follows closely that of the water, and it is the uniformity of the latter's temperature along the Pacific Coast, and its coldness, which conspire with the northwest winds of summer to cause the peculiar foggy conditions which prevail.

A HUNDRED-YEAR OLD STEAM ENGINE.—A "Sun-and-Planet" engine, designed by James Watt, has still a place in the famous brewery of Messrs. Whitbread & Co., and is still performing the duty for which it was constructed in 1785. The *City Press*, London, says: "Though there have been alterations to increase its power, all the principal parts remain as they were originally manufactured. A metal tablet affixed to the engine gives an account of its invention and history."

AN IMMENSE POSSIBLE SAVING.—It cost about \$7,000,000 to harvest the cotton crop of 1884-5, but it is asserted by the company which is introducing the new harvesters invented by

Owen T. Bugg that the work could have been done for \$7,000,000 by their machines. If \$50,000,000 are to be saved in gathering the crop, it would have some effect on prices.

THE GREATEST LUMBER MARKET IN THE WORLD.—Chicago is not only the greatest lumber market in the West, but also in the world. In 1847 the lumber receipts at this port amounted to a little over 32,000,000 feet. In 1850 they rose to considerably over 100,000,000 feet; in 1860 to over 262,000,000 feet; in 1870 to over 1,019,000,000 feet; in 1880 to over 1,564,000,000 feet, and in 1882 to over 2,116,000,000 feet. At this time a notable decline commenced, from which that market has not yet recovered. In 1883 the Chicago receipts fell off to 1,339,000,000 feet; in 1884 they dropped to 1,802,000,000 feet, and in 1885 only 1,700,000,000 feet were received there.

SILK SPINNING AND WEAVING.—There are about 100 mills in Philadelphia engaged in spinning and weaving silk, while there are four at Darby, a suburb. Flushes and velvets have recently been added to the products. About 8000 persons are employed on these industries in Philadelphia.

THE JAPAN PATENT SYSTEM.—A patent system was adopted in Japan last July, and now the number issued averages about two per day. They are mainly for agricultural implements, and are confined to residents of Japan entirely. Everything can be patented except medicines, which are ruled out.

PETROLEUM FUEL ON AN OCEAN STEAMER.—English journals record the late voyage of a large steamer owned in London which has been fitted to burn petroleum. Good time was made and general satisfaction is expressed with the experiment.

A CHEMICAL study of matter dredged by the Travailleur and Talisman expeditions has enabled M. Dieulefait to say that copper and zinc were universally detected in deposits obtained at great depths and in regions of the ocean widely remote from each other.

GOOD HEALTH.

Something About Bathing.

EDITORS PRESS:—As the bathing season approaches it may not be amiss to say a word on the good and ill effects of the bath. From the personal experience and observation of the writer, he must give it as his opinion that bathing, as a general thing, is injurious rather than beneficial to the human race. The avowal of such a belief in the outset of this communication will, no doubt, cause a howl of dissent from the thousands of refined readers of SCIENTIFIC PRESS. They, no doubt, entertain the same opinion as that of the proprietor of a "water cure," who, when asked what had the most refining influence on the human race replied, "soap."

Although cleanliness is refining and filthiness is degenerative, still, those who make the greatest pretensions to refinement and who take the greatest pride in the purity and softness of the skin, seldom indulge in the use of that over-estimated luxury, soap. There can be nothing more injurious to the skin than the unneutralized alkali which most soap contains, and it must be a filthy person, indeed, which cannot be made clean by the application of warm water and a towel. The stale odor of soap is not a pleasant thing to carry about the body, so anyone must know who ever took a sniff when passing the door of a Chinese laundry.

So much for soap; now does not the alkali of "hard water" have the same deleterious effect upon the skin? Compare the texture of the skin on the exposed surface of the body and that which is protected from the effects of the elements by clothing, and mark the difference. The difference is, not entirely caused by the effects of the sun and air, but chiefly by the water which is applied so often to the face, hands and neck.

There are many who can bathe with impunity even in the icy water of the bay of San Francisco, but they are such as have hides as tough as a seal, and who can eat as much as one, too. They are such as neither cold water nor dirt will have an ill effect upon. They are as much at home in the water as a fish and they can stand as much cold as a walrus. But persons who bathe most are those of weak, broken-down constitutions. They don't always bathe for the pleasure of bathing, but for the good effects to be derived from it. They take baths as they do medicine, through the advice of some well-wishing friend who has not learned the first principles of hygiene. They bathe because they think it will be the means of removing the foul matter discharged from the pores, not knowing that the corruption is in the blood and that all the water of the Pacific would not wash it out.

The effect of bathing is often the direct reverse of what is intended; for instead of the water having the effect of opening the pores it is the means of contracting the skin and closing them. As well might a person expect to make a tight boat comfortable by immersing it in cold water. But the advocates of bathing

will say, "Prudence should be used by the invalid when he takes a bath. The water should be of the proper temperature, and he should be rubbed and put to bed on leaving the bath." But where can the prudent invalid be found. Their imprudence is often shown by them in the highest degree in the manner of taking a bath. Where is the invalid who would submit to be blanketed and put to bed when under the delightful exhilaration derived from a bath? Like one under the influence of a moderate dram, he feels too happy then to go to bed. If ever he feels like enjoying life it is then. It is then he "seeks the graceful dance, the tennis some, and some the manly toils of" slopping.

But like the person under any kind of stimulant, how weak and inefficient he when the reaction comes. How much lower than he would have been had he not been stimulated at all. Will the machine last longer when it is run at its greatest capacity, or will it accomplish more in its whole existence? By no means; but generally speaking, a great deal less.

If the bathers leave the bath-tub or the surf, and go on in his usual habits of labor or pleasure, and if, after the expiration of a few hours, he should feel as well or better than he did before taking the bath, then the writer will admit that the lessons he has learned from his own experience and that of others have misled him. Let the bather leave a hot bath and remain in an atmosphere many degrees lower than that of the water, and if he has not an attack of catarrh, croup or congestion of the lungs the next day, he should congratulate himself upon being a person of great physical endurance.

The greatest desideratum to insure perfect health is an even, regular and temperate life, and he who fights against nature, either through ignorance or a desire to live faster for a few unprofitable moments will, sooner or later, suffer the painful effects of it.

A. S. YOUNG.

Ignorance Regarding Hydrophobia.

There is probably more ignorance abroad in the land relative to hydrophobia, says the *Kansas City Journal*, than almost any other disease that man or beast is heir to. It is quite safe to say that on an average of fifty dogs killed as rabid not more than one has the real rabies or hydrophobia. Most of the dogs killed as mad are simply afflicted with fits. A dog is seen running around aimlessly, snapping its jaws, from which foam is exuding, and immediately the cry of "Mad dog" is raised, and the animal is killed. Should any one be hitten visions of a horrible death from hydrophobia are conjured up, and for weeks and months the victim lives in a constant torture of fear.

Now dogs are subject to fits, especially in certain stages of distemper, and from other causes, and the symptoms of the disease are as above stated. Dogs never become mad suddenly. The disease progresses slowly, and the symptoms are readily discernible to one posted. The dog shows a great fear of light, hiding away in dark places, and comes out very reluctantly, and only at the stern commands of his master. It develops an abnormal appetite, eating hoards, and even pieces of old sheet-iron, tin, etc. It shows great nervousness, starting suddenly in apparent great fear of something. Its coat becomes dull and rough.

Finally, it shows a great horror for water, and then begins to wander around, snapping at objects aimlessly. It seldom moves with much speed. Its head is generally held low, its tail carried well between its legs and its hack arched. One who has seen a real mad dog will never confound it with the one charging around with fits. When three or four of the above symptoms develop themselves it is the part of prudence to kill the dog.

HOW TO GET STRONG.—One of the secrets of muscular recuperation is in stopping when fatigue begins from exercise. He or she who is not fresher in body and mind for the exercise taken, has had an overdose of what in proper measure would have proved a benefit. The gain in strength is shown and felt in the increasing ability to do more and more without exhaustion. The measure of success is not in the greatness of the feat accomplished, but in the ease with which the exercise is indulged in, and in the absence of exhaustion after it. There are occasions frequent enough in which people in the struggle of life are forced beyond their powers of endurance, and there is no need to carry into the pursuit of recreation the fatigue which exacting work imposes. For beginners this is important; after a time one can take more exercise and feel no fatigue.—*Herald of Health.*

HOW WE SPOIL OUR LUNGS.—Houses are always filled with more or less dust. During the winter, when the ventilation is imperfect, this is especially the case. The stove is a most common cause, as its heat dries up every bit of dirt in the room, and it is wafted about by currents of air, and stirred up by the skirts of women. Women probably do not know how much dust their skirts send into the air whenever they sweep over the carpet. It is invisible to the eye, except when the light of the sun shines on it. All this is breathed, and helps to spoil our lungs. Is there any help for it? At least one, and that is ventilation. Frequent and thorough ventilation, especially when the rooms are swept and dusted, while it does not remedy the evil, makes it less.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MOORE.—Amador Ledger, March 27: The work of sinking the shaft 100 feet deeper was commenced this week. This will carry the shaft to a total depth of over 400 feet. If at this depth the ledge, which is over 20 feet wide in the level now being worked, holds its own in size and quality, a 40-stamp mill will be erected. It will take six weeks to complete the sinking operations and the mill will be kept running during the time if possible, although it is considered doubtful if it can be done with the single-compartment shaft. From present indications the prospects are in every way flattering for the development of a great mine. The ore now being milled bears the general characteristics of the Zeile rock, and is, no doubt, a portion of the same ledge.

SUTTER CREEK.—Operations at the Mahoney mine are still in abeyance. E. Harrington has gone below for a few days, and in all probability the pump and skips will be put in operation as soon after his return as possible. The intention is to start up about the first of next month. At the Lincoln everything is running with clockwork regularity. The mill is kept going to its full capacity with plenty of pay ground in sight to operate upon. Mr. Stewart is taking the whole hill to the depth of 20 feet, and below this there is said to be pay ground that will no doubt be crushed when the superficial crust is disposed of. Drifting at the Eureka is still the order of the day. The drift has reached within 400 feet of the old works, and every precaution will be taken to prevent accident from the immense body of water contained in the old mine. The Iowa mill was started again a few days ago and will run for about a week more before a cleanup is made.

SAN JOAQUIN.—Operations at this mine at Pine Grove, formerly known as the Tellurium, were brought to a standstill last Saturday. A quantity of ore was taken out and the mill was kept running for several days. It was found on cleaning up that the rock would not pay expenses, and as soon as this was ascertained the owners ordered the mine closed. From \$10,000 to \$12,000 have been expended in this last venture on expensive hoisting and pumping machinery.

Alameda.

STRUCK THE COAL.—Livermore Herald, Mar. 25: Jenkins Richards has struck the coal vein in his long tunnel, 300 feet from the surface. Three men have been at work, in eight-hour shifts, night and day for over two months. He will now run in lateral drifts, open up a stope, and begin taking out coal sometime in May. Several thousand tons can be taken out without the use of an engine or hoisting apparatus. The vein struck is nearly five feet in width and the coal is about the best in the district.

El Dorado.

LONE JACK.—Cor. Georgetown Gazette, March 27: Rudolph Orth and Henry Anderson, prominent mining men of San Francisco, have purchased the Lone Jack mine situated one mile north of Johnstown, of Julius Johnson and John Hanley. The amount paid was \$10,000. The present owners will erect hoisting works and a ten stamp mill immediately. This mine has shown good prospects, and no doubt it will prove a valuable property to its owners. The same gentlemen have bonded the Bacchi mine, of which a short mention was made last week. Your correspondent having visited the mine, found Messrs. Orth and Anderson busy with rock which had been taken from the entire width of the ledge, and the gold that showed up was all that could be desired. Work will be commenced immediately. They propose sinking a shaft sufficiently deep to ascertain if the ledge is permanent. A tunnel will be run in at the foot of the hill 200 feet and tap the shaft 150 feet below the surface. This is only a small beginning of what is to be done in the near future in the way of mining. Your correspondent visited the Esperanza mine on Saturday last. Work is being pushed right along by Supt. Burlingham. This mine bids fair to be one of the most valuable in the county.

CLEAN-UP.—Placerville Observer, March 27: Armstrong & Robert, at Henry's Diggings, have just cleaned up their drift claim, washing 400 wheelbarrow loads, realizing a little over thirty ounces of gold, most of which was coarse, nuggets going as high as two ounces. They started a new tunnel last Monday to tap the old works at greater depth. This tunnel will be run about 200 feet before the old works can be reached, when they expect to find even better gravel than that just cleaned up. These gentlemen richly deserve their prosperity.

THE INDEPENDENCE MINE.—In Consummes township, is showing a ledge 4½ feet wide of ore that is estimated by mining men at fully \$30 per ton. Supt. Russell intended starting the mill up yesterday, and calculates to work 15 tons of ore per day. This will bring into existence for the use of mankind the nice little sum of \$450 per day. E. R. Morey was down from Grizzly Flat last Wednesday, accompanied by Stephen Jeffrey. Mr. Morey was making a transfer of his Charles mine to Supt. Finley, representing the Mount Pleasant Mining Company, for a consideration of \$5,000. The Charles is located just north of the Mount Pleasant mine, and when worked seven years ago produced \$7,300 in one week. This mine will be worked in connection with the Mount Pleasant, and will be at least thoroughly prospected. The Bradley ditch, taking water to Henry's Diggings, in Consummes township, is in a bad state of repair, and the miners are suffering for water.

Inyo.

AN OLD MINE RESURRECTED.—Inyo Independent, Mar. 27: Twenty years ago there was a mining excitement at Chrysopolis ten miles north of Independence station. Some rich gold rock was found, a mill was built and a good deal of work was done in mining. Those were times of inflated ideas, miners expected to make fortunes in a few weeks, or months at farthest, and unless they got large gains immediately their claims were abandoned. Rock that would not pay at least one hundred and fifty dollars a ton was regarded as worthless. These were the ideas of the men who opened the Oro Fino mine at

Chrysopolis; they were disappointed by not making fortunes at once, got disgusted and quit and the mine was abandoned. Some time ago the property came into possession of Harris & Rhine of Independence. About three weeks ago an arrangement was made with two miners named Wilcox and Manton, by which they were to reopen the mine and prospect it. Very liberal terms and all necessary financial aid was given them, and already they have opened up what has every appearance of being a large and valuable ore body. The ledge is full six feet wide, and at least twelve inches of this is quite high grade ore. More men have been put to work in the mine, which has been re-named the "Hope"; ore is being got out rapidly and the Maxim mill will be set to work upon it soon.

Mariposa.

A RICH FIND.—Mariposa Herald, March 26: The people of Mariposa managed to get up a little excitement last Saturday, for the first time in a good many moons, when M. M. Rumley brought to town \$6,000 in gold, the result of one day's work on his claim near Saxton creek. Eleven months ago Mr. Rumley closed his saddle and harness shop in Mariposa and went out to work on the tale lead. He worked several months there and the result not being satisfactory, he concluded to prospect the hill just back of the Buena Vista mill. He commenced work with a pick and pan. At the bottom of the hill and prospected up, and at the place where he found the coarsest gold he began to sink. Last Friday at a depth of six feet he found the pocket and at noon commenced taking out the gold. By Saturday noon he had \$6,000. He came into town that afternoon and remained until Monday, when he went back to see how much more he could find. Up to the Monday preceding the strike Mr. Rumley had worked 10 months and 3 weeks and had made but \$30. He is a sober, steady, industrious man, and is well calculated to stand prosperity. It will be no surprise if he takes out a million in the next few days, for the country out there is full of the precious metal. Later—Since going to press Mr. Rumley brought in 16 pounds of quartz and gold estimated to be worth \$3,000. Intense excitement prevails in Mariposa, and the town will be deserted to-day, as everybody is rushing to the new El Dorado.

Nevada.

THE CROWN POINT.—Grass Valley Union, Mar. 24: The work of cleaning out the shaft to the 300 level of the Crown Point mine is nearly completed, there being but about 10 feet more of debris to remove when drifts will be started both ways from the shaft. Work on the new reservoir, which is to supply the mine with water at a much greater pressure than is obtainable at present, is progressing favorably, and in about a week more all will be in readiness. The ledge in the 180 stope is looking as well as ever and holds its full width. Some very fine specimens were taken from this stope yesterday, they showing plenty of free gold and heavy sulphurets and galena. Another ledge has been encountered in the easterly drift, which runs to the foot wall, and lays very flat. The rock from the new ledge is entirely different from anything yet found in the mine, and in the course of time it will be prospected. Everything about the Crown Point is very encouraging.

THE BADGER.—The work of grading and timbering a portion of the old shaft at the Badger mine is progressing finely, and if the present good weather holds out the machinery will be ready to start up in about a month. In a short time the machinery from the old Washington mine will be laid down on the Badger ground. The tunnel from the Idaho ditch which is to supply the Badger with water power, is being driven with all possible speed. From one approach the tunnel is in 80 feet and from the other end about 50 feet, and the ground is not hard to work. It is thought the tunnel will be ready to turn water through as soon as the hoisting works are in place and the machinery ready to move.

Placer.

THE MEDA MINE.—Argus, March 25: The Meda mine, a mile and a half southeast of New England Mills, is now under the experienced management of Messrs. Smith & Hersey, who have the mine under bond for a year. A late partial cleanup after twenty days' work, much of which was dead work, yielded some \$450—not very much, but enough to give encouragement to the enterprising operators above named. Previous to December last the mine had lain idle for some years. The hoisting-works and the mill (a five stamp one) are run by steam. The mine comprises, among other improvements, an inclined shaft of 87 feet, and two tunnels, each 180 feet long one of which is down 30 feet, other 67 feet. A third tunnel is connected by means of a track and trestle with the top of the mill. By its means a great deal of otherwise unprofitable work is avoided, and the cost of taking out the ore is reduced to the minimum, something less than two dollars per ton.

Plumas.

GOOD PROSPECTS.—Cor. Mt. Messenger, March 27: The prospects in this county were never better than at this time. A prospect tunnel has been running for some time under the direction of John H. Thomas, into a mountain near Onino valley, where many old miners said it would be a failure. A short time since they struck through into one of the richest beds of gravel that has ever been opened anywhere in this section of country, paying from \$10 to \$25 per carload.

San Bernardino.

CALICO.—Print, March 28: The Lander Bros. have struck it rich on their claim in East Calico. The boys are about to be richly rewarded for their labor. On the Blackfoot mine ten chlorides are mining with good results. A large amount of money has been taken out of this well-known claim and the prospects are thousands more will be its yield.

San Diego.

STONEWALL.—Los Angeles Times, March 26: A gentleman just in from the Stonewall mine at Julian, San Diego county, has left on exhibition at this office a sample of quartz from this famous mine which fairly glistens with free gold. This mine, as is known by most readers of the Times, is owned by Dr. J. E. Fulton and Alfred James, of Los Angeles. The rock is running \$30 to the ton at present, and the output amounts to \$600 a day. It is a bonanza.

Shasta.

MILL.—Shasta Co. Democrat, March 25: The owners of the Clipper mine on Squaw creek are figuring on putting up a mill on the mine. Hopping & Bell expect to have their mill in operation on the

Central in Old Diggings district next Monday. O. P. Whitton has sold his quarter interest in the Croesus mine on Squaw creek to Billy Edwards of Red Bluff. Last week, while sinking a new shaft on the tellurium mine on Salt creek Mr. Scheerer struck more tellurium ore. The placer miners of Buckeye district are preparing to clean up, and all expect good returns for their winter's work. Mr. De Forest intends to increase the facilities of his assay office by adding two more furnaces and building on an addition to his establishment. Reid & Co., for the past two months have been running a new tunnel on their mine on Star gulch, and last Saturday struck the vein. It is three feet in width and the ore prospects splendidly. The proprietors are highly elated. Jim Brincard and his brother-in-law, Lowery, last week struck a fine gold prospect near Copley. The vein is about five feet in width and is capped with iron gossan which prospects splendidly in free gold. They have made two locations. Fred Meyers, the Red Bluff teamster, who had such good success hauling in the machinery for the Croesus mine, has been awarded the contract to haul in the machinery for Matthews & Co., and is now at work on the job. Fred is a rustler and knows how to tackle such work. Andy Fife is moving his Huntington mill and ore concentrator from Lower Springs over to Potter's mine on Spring creek near the old Stump ranch. There are about 200 tons of this ore to start on. The machinery will be propelled by water power, and he expects to have it in operation by the middle of next week. Representatives of a San Francisco company are negotiating for the Mammoth mine in Old Diggings district. We learned yesterday from an interested party that the purchase price was agreed upon, but the sale was pending on the amount of money paid down. The sale is thought to be as good as made, however. It is thought that another roasting furnace will have to be added to the Iron Mountain mill before the ore can be successfully treated. O. Earl, president of the company, came up the latter part of last week to confer with the superintendent about the matter. Mr. Earl thinks it will take two months yet to get everything working properly and find out what is needed.

GO.—Shasta Courier, March 27: Our mining interests are looking up considerable. The arastras on South Fork have been running on good ore all winter, and gives satisfaction to the owners thereof. Capt. G. H. Atkins is now in San Francisco purchasing a mill to crush the ore from Cooper & Robinson's mine, in which he is part owner. The Hard Scramble mine has just made a good cleanup, and is now in running order again. There are also considerable placer mines being worked near Igo.

BROWN BEAR MINE.—The 10-stamp mill here is kept constantly running day and night, and between thirty and forty men are employed. The demand for labor over here, and all along from French Gulch, at present, appears to be pretty well supplied, and none but skilled workmen in all grades of employment meet with much encouragement.

CLEANUP.—The lessees of part of the Washington mine cleaned up from twenty-seven tons of ore which yielded ninety-seven ounces of gold; that, at \$16 per ounce, gives \$1,552—\$57.40 the ton.

Siskiyou.

QUARTZ EXCITEMENT.—Yreka Union, March 26: The south fork of Mill creek, five miles from Scott Bar, is the seat of the latest quartz excitement. The richness of the placer mines in that section indicate that good quartz lodes exist and the new discoveries are likely to prove bonanzas. Eastlick brothers at Oro Fino have run their new elevator for the past seventy days and will have water forty or fifty days longer. They have reason to expect a large cleanup, having stripped considerable bedrock.

Trinity.

THE RICHEST.—Journal, March 27: Fred. H. Loring, of Calhoun Ranch, Siskiyou county, spent a couple of days in town this week. He carries a gold specimen from the Grover Cleveland mine, in New River district, which is the best ever taken from quartz in this county. It weighs about \$25 and is nearly all gold. Mr. Loring will visit Deadwood and French Gulch district to inspect the mills in operation there with a view to getting a suitable crusher for the Grover Cleveland mine. He has abundant faith in the quartz mines of New River district.

THE LAST CHANCE.—Unless more rain comes soon, the hydraulic mining season will be brought to a close at an unprecedented early date. In 1879 there was 8.28 inches of rain fell during the month of April, and it is hoped the same month of the present year will be equally as moist.

FAVORABLE REPORT.—The Oregon Gulch Mountain mine, under the superintendency of O. M. Loveridge, will make an excellent showing this season; the ground now being worked prospects splendidly.

DOING GOOD WORK.—Supt. Benjamin, of the Hayes Red Hill gold mines, informs us that everything in and about the mines is running in splendid order and good work is being done.

Tuolumne.

STRIKE.—Tuolumne Independent, March 27: A rich strike has been made in the Harriman & Keil quartz claim, one mile north of Sonora, above the French Garden, near the Phoenix ditch. This was formerly known as the "old Mexican claim," and latterly as the Keyser mine. The owners, Messrs. H. & K., have leased the mine to four Austrians, the lease expires in May. It is an expensive claim to work, requiring to be timbered every inch of the way. The strike was made about three weeks ago, ninety feet below the surface, and is still paying largely to date. Rumor has it that \$300 was washed out of one pan of dirt and quartz, and that a gold brick has been seen containing eight pounds, valued at \$2,000. Prof. Shraft and Thos. Bluet, owners of the Annie mine, beyond Columbia, struck a nice pocket last week, which yielded \$200, with probably more to come. They have had several good finds before, and we hope they will find many more, and bigger ones, in the future.

NEVADA.

Washoe District.

HALE AND NORCROSS.—Virginia Enterprise, March 27: The upraise from the 3000 level has nearly reached the 2900, and the connection will be made to-day. This is a very important connection, not only for air circulation purposes, but in the development of the body of good ore passed through

by the upraise. The main object has been to carry this upraise winze through to the 2900, therefore there has been no side stoping, but the upraise has been in ore all the way, some of which is of a rich character and the whole will give good milling returns. The upraise from the 3000 level is showing splendidly, developing a body of fine ore in which gold predominates, 20 feet in width and evidently much wider. The ore from these lower level from the old Mexican shaft, have made their usual progress, showing no improvement since last week's regular report. Both are crosscutting the vein, and showing only low-grade ore thus far. On the 2500 level of this mine, south of the shaft, a vein of very good ore was developed some 20 years ago about 10 feet wide. It was rich, but there was so much base metal, lead, antimony, etc., in it that it did not pay for extraction and reduction. By roasting, however, with the present improvements and appliances, it could be made to pay very well, especially if a concentrator were brought into practical application in the matter.

HOLLAR.—As remarked last week, no crosscutting is being indulged in as yet on the 3000 level, and no orders received to resume sinking the Combination shaft. In fact, sinking this shaft deeper at present would interfere with the exploration of the 3000 level, including the advancement into the Potosi ground, which is being conducted through the Chollar. Supt. Hamilton will return from San Francisco in a day or two, when something definite will probably be known and demonstrated as to future propositions and operations.

CON. CALIFORNIA AND VIRGINIA.—Everything working finely, with the ore production fully up to the standard—over 400 tons per day. Average assays from the mill batteries, about \$73 per ton. The drift running northwest on the 1400 level is now in 446 feet, 63 feet having been added during the week. On the 1650 level a crosscut has been started west from the main northwest drift to get into the old bonanza ore stopes and workings at a more eligible point farther south.

BEST AND BELCHER.—The pumps are still holding the water at the 2128 station. The drift north on this level is the only connection with the C. and C. shaft and the north-end mines. A heavy bulkhead placed in this drift to shut off the water flowing from that direction is being strengthened, and as the level is getting pretty well drained, the donkey pumps will be started up to-morrow to drain the shaft to a greater depth.

POTOSI.—The main lateral drift southward, or rather southeast, is being shoved ahead at the rate of 11 feet per day, and is now 150 feet into Potosi ground from the Chollar south line. Material, vein porphyry, dry and favorable, no water interfering. Seven hundred feet is the lateral extent of the Potosi and the Chollar respectively.

MEXICAN.—On the 1500 level, west crosscut No. 2 is in 250 feet. The east crosscut on the same level is in 72 feet. Material at both points, principally vein porphyry. On the 700 level the joint Union and Mexican drift running northwest from the Ophir shaft is in 140 feet, 39 feet having been added during the week.

GOULD AND CURRY.—On the 600 level the old southwest drift has been cleared out and retimbered 34 feet during the week, making a total length of 320 feet from the main west drift. It is expected to be reopened through to the Savage north line in about two weeks.

CROWN POINT AND BELCHER.—The daily output of ore from these two mines is about 375 tons. The old ore stopes of the upper levels hold out well, and some pretty good ore comes from the 1600 and 1700 levels.

UNION CON.—On the 500 level north lateral drift No. 2 has been advanced 37 feet, making a total extent of 290 feet. Material, wet vein porphyry, with streaks of clay and decomposed quartz.

OVERMAN.—About 50 tons per day of low-grade ore are being extracted from this mine, through the old Petaluma street tunnel. It is all from the upper workings above the 250 level.

MONTE CRISTO.—No ore is being extracted at present, but drifts west are being run on the 50 and 150 levels from the main shaft. The rock is very hard, consequently slow progress is made.

SIERRA NEVADA.—West crosscut No. 2 on the 520 level was advanced 38 feet during the week, making a total length of 268 feet. Material, vein porphyry, with streaks of clay and quartz.

YELLOW JACKET.—The regular daily yield of about 130 tons continues from the old upper workings above the 1300 level, keeping the Brunswick mill steadily supplied.

KENTUCK.—The old upper workings continue their daily output of about 45 tons per day, supplying the Rock Point mill.

ALTA.—On the 700 level the main lateral drift north has nearly reached the south line of the Benton ground. Material, dry vein porphyry.

JUSTICE.—Work is going ahead, developing the low-grade resources on the 350 level, at the south end of the mine.

Bell District.

SUSPENDED.—Belmont Courier, March 20: Work has been temporarily suspended in the mines of Bell district.

Belmont District.

CHICAGO.—Belmont Courier, Mar. 20: Supt. D. H. Jackson, of the Chicago Mining and Reduction company, Ophir Canyon, is in San Francisco for the purpose of purchasing an air compressor and Burleigh drills for the faster prosecution of work in the mine. The mill continues to run steadily turning out its usual quantity of the white metal, and the ore reserves in the mine are looking as healthy as ever. This mine has a big history in front of it—dividends in embryo.

Columbus District.

IMPROVEMENTS AT THE MILL.—True Fissure, March 26: J. B. White & Co. have completed the retort house and assay office at the new mill and have built a platform from the ore-receiving room to the bank in the rear of the mill. The mill company is now building an ore chute 100 feet long and is completing a water tank with a capacity of 20,000 gallons.

HOLMES.—We are still working in the McCuen ledge, near the old seventh level. The ledge is small, but looks better than at last report. The ore is good and the ledge looks well. The stope 60 feet

deposits, removed in the explorations, has been and is being deposited in the main drifts preparatory to the time when the proper hoisting facilities can be given at the Combination shaft. When this can be done it will be a mere matter of raising the ore, milling it and shipping the resultant bricks to San Francisco.

OHIO.—The drifts on the 300 and 400 levels, below the Morris looks the same. The ledge is very large and is producing good milling ore. The whole ledge in this stope goes to the mills. In the eighth level we are stopping in the Morris ledge. This stope is 170 feet long, will average $\frac{1}{4}$ foot wide and the ore is good milling. The new ore body in this stope runs off into the hanging-wall of the main stope at a point about 90 feet west of the east end of the main stope. This ore body runs in a north-westerly direction from the main stope. It will average $\frac{1}{4}$ foot wide. It is a parallel ore body to the main eighth. The gypsum ore body still looks well. We are taking out a large amount of ore from this stope.

MR. DIABLO.—The stope above the west drift on the 4th level shows a foot of 600 ore. In the intermediate between the third and fourth levels we are taking out a little ore of fair grade. The stope above the west drift on the third level is giving some ore of good grade. The stope above the east drift on the second level shows several streaks of 600 to 1000 ore that looks promising. From the west drift on the second level we are taking some rich ore from small streaks. The west drift between the first and second levels is in 49 feet and the face shows 3 feet of 600 ore.

Esmeralda District.

AURORA.—Walker Lake *Bulletin*, March 25: The station on the 200 foot level of the Humboldt Hill mine in Aurora was cut out on Monday. It is expected that the 300 foot level will be reached by the fifteenth of next month. Everything in the old camp looks encouraging and there is no doubt that the company now at work will meet with abundant success in the enterprise.

Eureka District.

PROSPECTS OF THE CAMP.—Eureka *Sentinel*, March 25: Eureka is certainly passing through a very quiet period, but there are unmistakable evidences of a prosperous era dawning shortly on the mining situation of the district. We do not say this way in order to show a "stiff upper lip" or to inspire unwarranted expectations. This feeling of hopefulness is shared by all of our people who are in any way posted on what is going on in connection with the mining properties of the district. That a compromise of the differences existing between the Albion and Richmond Co.'s will shortly be consummated is highly probable. Such an understanding would no doubt result in the Richmond Co. entering into full ownership of the Albion mining ground, which embraces five or six original claims. This in connection with the large area of ground now owned by the Richmond would give the company an immense piece of mining property in the richest section of the entire district. The greater portion of the Albion ground is what might be termed "virgin," and once acquired by the Richmond it is probable the operations of the company during the coming summer will equal if not exceed any ever carried on by them. The ground now owned by them is by no means wholly prospected above the 1000-foot or water level, and numerous "pitches" are yielding large quantities of ore of good grade. The Albion property has, practically, been idle since the commencement of litigation with the Richmond several years ago. Stockholders in the Eureka Co. mine have good reasons for feeling hopeful. Several of the pitches in the property are producing good ore in large quantities, and a station is about completed on the fourth level to accommodate a diamond drill, which will shortly be utilized to prospect a large block of untouched ground in that locality. Then, too, the company are having constructed new machinery, to be used for draining the mine of the water in the lower levels and for hoisting purposes. This machinery, according to the agreement with the Union Iron Works in San Francisco, as we understand it, is to be finished by the 15th of May. When once on the ground and in working order it will be used for the ultimate purpose of sinking the main shaft of the mine and prospecting the property at depth. Supt. Hank Donnelly, one of the most practical and conservative mining men on the Coast, has, we understand, unbounded faith in the permanency of the mineral wealth of the property below the water levels. It is also highly probable that the Jackson mine that adjoins the Eureka Co., on the south will be worked vigorously during the coming year. During the past year and a half it has been worked by less than a dozen tributaries. In that time four ten-cent dividends have been paid the stockholders, and the company, we are told, have enough coin on hand to pay another like "divy." Most of the ore produced is rich in gold. As yet the upper—that is, above water—levels are not more than half prospected. The property includes half a dozen original claims. The Phoenix mine adjoins the Jackson and also the Eureka Co. It is worked on a decidedly limited scale, and, as a consequence, is not making the showing that it should. The few tributaries working in it make an occasional shipment of ore to the two reduction works in town. Like many other corporations represented in the district the Phoenix is probably waiting to see what some of its neighbors are going to do. On Prospect Mountain are many properties that will be actively worked, among which will be the Lord Byron, Home Ticket, Dunderberg, Lizzie L, Silver Connor and a dozen or fifteen equally as good. Work is being carried on now in many of them, but in most cases it is of a "dead" character. On Adams Hill the outlook is flattering. The Bowman Co. continues to make occasional shipments of ore to the two reduction works in town. Last year they added several claims to their original property, and now they are negotiating with Messrs. Chamberlin and Adams, two ex-Eurekans, for the purchase of the Rosina claim. The work they are doing in their property is limited, but it bids fair to reach large proportions during the coming summer.

Genoa District.

ANOTHER PROMISING DISCOVERY.—March 26: *Courier*: It is claimed that a ledge 100 feet wide has been discovered about half a mile north of Sierra Canyon, in Genoa district, by Dr. Algerier. He has named it the "Nevada mine," and claims that five feet of the vein is very rich in silver, and carries a high percentage of gold. The remaining ninety-

five feet is claimed to be good pay ore. The old Sierra tunnel will, when extended about 1,000 feet further, cut this vein, and the proposition is to reopen it and begin systematic work.

Hawthorne District.

LAPANTA.—Walker Lake *Bulletin*, March 25: Developments of ore in the Lapanta increase in size and value from week to week. In the lowest working there is now a six-foot vein of the rich white quartz which appeared in a few places near the surface. At another point a body of quartz which is spotted with coarse gold, has been uncovered. The mine has about doubled in value since the negotiations for the sale were broken off and the agents for the English company are now doubtless regretting their delay in making the purchase.

Jackson District.

MILL RUNNING.—Silver State, March 26: Joe O'Neil, who arrived yesterday from Jackson district, says the new mill is running steadily and doing good work. A body of what is believed to be very rich ore has been struck in the bottom of the Pennsylvania shaft, at a depth of about 35 feet. The camp is lively and everybody is at work.

Jefferson District.

CHLORIDERS.—Belmont *Courier*, March 20: The chloriders of Jefferson continue to take out good ore.

Manhattan District.

WAITING.—Belmont *Courier*, March 20: Work will not be resumed in the mines of Manhattan district until the weather becomes more settled.

Reveille District.

DEVELOPMENT.—Belmont *Courier*, March 20: The work of development goes bravely on in the mines of Reveille district.

Tuscarora District.

GRAND REVIEW.—Times-Review, March 26: South drift on the 200-foot level extended 18 feet, and south drift on the 300-foot level 15 feet. Stopes are producing some ore, but not enough to keep the mill running.

BELLE ISLE.—North drift from east crosscut No. 1, 450 foot level, has been extended $\frac{1}{4}$ foot with no material change. Belle Isle and Navajo joint crosscut has been extended 13 feet the past week.

NAVAJO.—No. 1 upraise on east lateral has been carried up 5 feet the past week. No. 2 upraise on east vein, same level, has been extended 11 feet; total height 109 feet. Crosscut No. 2, 250 foot level, has been extended 4 feet; rock getting more favorable for progress.

Tybo District.

A REVIVAL.—Belmont *Courier*, Mar. 20: The people of Tybo are of the opinion that with the advent of summer they will see a revival of mining there. J. D. Page, of Tybo, informs us that he has been working all winter in his mine on the hill opposite the Two-G property. He has encountered some very rich silver ore, and he believes that the mine will prove a valuable one in the course of time. Some time ago he sent a sack of ore to Eureka for the purpose of having it tested to ascertain its value and the result proved very satisfactory. The Gilmore brothers continue to work their mine at Tybo with very encouraging results. It is now sufficiently opened to render it a desirable property for a company of capitalists to handle. Quite a large quantity of good milling ore is exposed ready to stope. This ore assays from one hundred to over two hundred dollars per ton.

ALASKA.

THE GOLD FIELDS.—Cor. *Examiner*, March 28: The whole of Alaska Territory is more or less a gold field needing capital to develop it, quartz of a low grade, but in immense quantities being found on every hand. The Treadwell mine on Douglas island, almost opposite this camp, is an example of this. They have the largest quartz mill in the United States, viz., 120 stamps, working night and day, and averaging over \$50,000 per month. There are rich diggings, both placer and quartz, four miles from Juneau in the basin, but owing to its inaccessibility and the lack of water and capital invested to bring it in, they are not worked to one-tenth of their capacity. There are good diggings almost in the town on Gold creek, but the same obstacles render them valueless and idle. The Yukon river excitement has broken out with increased vigor. Hughes, the explorer, started two weeks ago for the new diggings, closely followed by at least a dozen different parties of explorers and prospectors. Hughes is the man who returned to Juneau last fall with sixty-two ounces fine as the product of eleven days work. From latest information the new find is located on Stewart river in the northwestern Territory. There are rumors of a large party of Montanians who have started for it from Benton, Montana, but they will never reach it that way. There is only one route, from Frisco to Portland, from Portland to Juneau City via steamer Idaho, from Juneau to Chilcoot, thence by portage over the divide to the lakes. There they build flatboats and glide peacefully down the chain of lakes to the river and the mines. Miners' wages here are \$4 to \$5 per day. Carpenters have more work than they can do at \$5 per day, as over 20 new buildings are going up and more are having the foundations laid. A new town has just been started on Douglas island directly opposite Juneau, keeping three small ferry-boats running. I would advise no man to start here without money, as although provisions, etc., are cheap, yet it takes money to outfit and to pack said outfit over the divide, but a man with a capital of \$200 can make the Yukon country with ease, and from all reports and the indisputable fact of the gold being brought out from there by Hughes and party it will be his own fault if he don't make a profitable investment.

ARIZONA.

GOLD.—Prescott *Courier*, March 27: Six tons of gold ore from the 110 mine, in Groom creek district, were recently worked by Mr. Cartmell, with a paying result. Now that snow is going, more chloriding will soon be done. Turkey creek mine owners are paying three dollars a day, out of which miners have to board themselves. Mines of Humbig district are producing a great deal of gold and silver. The bullion goes out of the Territory via Phenix, at which place the miners do their trading. Were Prescott merchants to go down there and interview them, a fair share of their business would be turned in this

direction. An engine, to run arastras, was recently shipped from Prescott to Messrs. Munn & Co., of Cherry district. A cleanup will shortly be made at the Lynx creek hydraulic diggings. It is said that the Oro Fino company are repairing bursted pipes. Word comes from Weaver that water from Hassayampa creek, will shortly be conducted in pipes to the camp.

COLORADO.

LEADVILLE.—Herald-Democrat, March 26: The lessees of the Crescentia shaft are engaged in placing a twenty-five horse-power hoister on this property. Considerable fair iron ore has been shipped from the Chieftain mine on Yankee Hill during the past winter. Manager Kroger of the Tip-Top shaft states that he hopes to have it drained and sinking resumed within a week. Mr. J. R. Loker is engaged in some interesting prospect work in California gulch, near the foot of Harrison avenue. The Wolfone mine is shipping a lot of 500 tons of ore, and is about making a contract for another lot of equal tonnage. Large shipments of ore are being made daily from the Limes shaft, in which a strong ore chute was disclosed a short time ago. The Diner mine on Sugar Loaf mountain is reported to have shipped over \$40,000 worth of ore during the past four or five weeks. The Castle View shaft on Carbonate Hill has attained a depth of 506 feet and is being sunk deeper. The last forty feet of the shaft have gone through iron ore. Mr. Paul Weitzel, the owner of the Hard Cash mine on Yankee Hill, will resume work on his property this morning. Mr. Ebe Smith has lately examined the Mike and Star mine for some of the principal stockholders, and it is not improbable that the company will resume work on an extensive scale shortly. Mr. Sanderson, of Denver, and Bill Lovell have taken a lease on the Oolyte and other claims, situated in the flat, a short distance northeast of the Manville Smelting Works, and are preparing to work the property actively.

IDAHO.

MILL.—Ketchum *Keystone*, March 26: The Columbia & Beaver mill at Sawtooth will be operated this season. The North Star on East Fork will be one of the most productive mines in the district during 1886. The Silver Star on Smoky is said to be looking exceedingly well and other Smoky properties are developing new riches. The Balcher on Boulder has ten tons of very high grade ore ready for shipment. The lowest assays 155 ounces in silver. W. D. Vernam of the Columbia & Beaver company writes to Ketchum that he will be on hand to open up the Sawtooth grade to travel next month. This indicates an active interest in mining and milling operations in that locality.

A NEW VEIN IN THE PARKER.—We learn from Prof. Jenney that a new vein has been found in the Parker mine which offers some encouragement to deep mining on Elkhorn Hill. It was struck where the old vein broke off, at a depth of 400 feet on the ledge, coming up at a much steeper pitch and apparently from porphyry through the lime formation. It is four feet from wall to wall and carries iron pyrites and traces of lead. As stated, it broke off at a deep pitch and conveys indications of a deep body. Further analysis of the character of the rock may throw some light upon the uncovered depths in that locality and even now the Prof. seems of the conviction that the ledge is of considerable significance.

WINTER ORE COMING IN.—Wood River *Times*, March 24: The miners who have been working all winter on claims at the head of Narrow Gauge gulch are about to realize on their labor by selling their ore. C. E. Bolton has taken a contract to haul 25 tons of Red Cloud and 40 tons of Argenta ore to Hailey. He has already secured three teams and broken the roads to the mines, and expects to get the ore down to Hailey by the end of next week.

MINNIE MOORE NOTES.—Up to Saturday night the situation at the Minnie was this: The ledge that was first struck proved, by actual measurement, to be 6 feet 6 inches wide from hanging to foot wall. Twelve inches of mineral was found next to the hanging wall, then two feet of high-grade steel galena and gray copper, then three feet of jigging ore of good quality. Thirty tons of high-grade ore had been extracted up to Saturday evening in running the crosscut. This will be sacked and shipped at once. Another strike on the 360 station, at the end of the west drift, was made. These in running crosscuts. No stoping yet, recollect.

MONTANA.

BUTTE.—Inter-Mountain, March 26: The mills and smelters are fully supplied with ore and are running at their full capacity. The Alice is raising the usual amount of ore. The Magna Charta is raising 10 tons of ore per day. Goldsmith is raising 200 tons per month. From the Minnie Irvine the lessees estimate that over \$20,000 worth of ore has been taken already, and the indications for its future productiveness are favorable. At the Amy and Silversmith small quantities of ore are being raised daily from the stopes over the 200-foot level; and the crosscuts from 300 and 400 stations are being run. The Germania is looking well, and is producing some very rich ore. The water is fully under control. The stopes are in about two feet of ore. The shaft of Clark's Colusa is about 430 feet deep and is being sunk to the 450-foot station. About 200 tons of ore are being raised daily from the levels and stopes. The Matt lodge, near Meadville, has been recently sold to a San Francisco company, who have begun work on the property.

NEW MEXICO.

LADRONE DISTRICT.—Socorro *Bulletin*, March 27: C. F. Adelman leaves this morning to work his Blackington claim in Ladrone district. A Harris is the general manager of the Illinois mine at Kingston, and is working it in the most orthodox manner. It is one of the best ventilated mines in the Territory. Donald McRae is shipping ore from his Lawrence mine of the Ladrone district to the Billing works for treatment. H. G. Cook, of Tombstone, A. T., is at the Parker house. He brings a carload of silver chloride ore from the Silver Cloud mine for the Billing smelter, and expects a large consignment coming from the Visna mine in the same camp, and others to follow, all for the same destination. H. C. O'Rear, superintendent of the Brittenstene Com-

pany's mines, says the Brittenstene plant is running successfully and turning out rich concentrates and gold and silver amalgam; and that the mines generally in the Pueblo district are visibly improving.

OREGON.

QUARTZ AND PLACER.—Jacksonville *Times*, March 26: Water is falling fast and most of the placer miners have commenced to clean up. Redden & Hurt are busily engaged in opening the Miller placer mines on Sardine creek. About one-half million dollars will be taken out of the mines in Jackson and Josephine counties this season. Many claims have been located in the Wagner creek district, and everybody there is waiting for the arrival of the mill, which is expected soon. A large amount of quartz is being hauled to the mill at this place from Geo. Schump's ledge in Willow Springs precinct. It is now being crushed. Messrs. Ingram, Dean, Baker and Farrar of the Willow Springs district have made a partial cleanup, and brought a respectable amount of gold-dust to town this week. Jas. McDonough & Co. are engaged in running a tunnel to tap their quartz ledge, better known as the old Dunham mine, and have some promising quartz already in sight. Grob & Braendel being satisfied with the result of the cleanup made at the quartz mill here, after running several days on ore from their mine, are continuing work. As the quartz which was crushed was principally from near the surface they expect to make a much better report next time. McKenzie, Brown & Co. had nearly twenty tons of ore from their ledge on Jackson creek crushed at the Jacksonville quartz mill last week, which paid them between \$7 and \$8 per ton in free gold, besides which there was a considerable quantity of sulphurates, which no doubt contained some gold also. As the rock was not considered choice, by any means, they feel quite hopeful of making a better showing next time.

JUMP-OFF-JOE.—Grant's *Pass Courier*, March 26: We learn that the miners on Jump-off-Joe are working steadily, and have plenty of water. The season has been unusually favorable in that respect, and there is every indication of a good cleanup when the water falls.

ALTHOUSE.—March 19: The Guirdaldia Bros. are steadily at work ground-slucing, and will not commence to clean up until some time in June. Henry Drew on lower Grass flat has got his new drift now open, and has favorable prospects for a good summer's work before him. McLaughlin is still ground-slucing on the east side of the creek opposite Grass flat. Joseph Trimby is piping away a large amount of ground on the left hand fork. This ground has paid very rich in times past, and the considerable ground yet left. James Turnbull, after nearly three months blasting through hard bed-rock, has again struck the pay gravel in his tunnel on the upper end of Grass flat. Antone Miller on the head of Althouse is taking out some very pretty gold. He got one piece the other day valued at about twenty-three dollars. The water season is very short on this claim, were it otherwise a large amount of dust would be taken out every season. Hansen & Co. are preparing to bring their claim into shape for cleaning up. Water for the past two weeks has not been plentiful with them for piping, and the drip, drip, from the clouds does not give promise of a much longer water season. April will, for the most part, let out the piping operations on this creek.

UTAH.

THE TOOOLE MINES.—Salt Lake *Tribune*, March 25: Mr. C. E. Mitchener, manager of the mines and mill belonging to the Honerine Company at Stockton, was in the city yesterday looking after business, and among other things urging the Union Pacific people to extend their Utah & Nevada road to Stockton. Regarding this proposition he said it was as yet a question of doubt, but hoped that the company would consider the matter favorably in the interest of the camp. Respecting the mining interests about Stockton, Ophir and Dry canyon, which really form one district, Mitchener expressed the opinion that the district was destined to become one of the best in Utah, even if it had been considered a played-out camp for several years. A big strike has been made on the Silver King owned by the Neidringhaus syndicate. On the 400-foot level an ore chute was struck, on which drifting has been done a distance of 117 feet, all the way in ore, and it is not known how much further the chute extends. This ore averages all of \$30 per ton, the first-class running up to \$60. They are now drifting on the third and fifth levels to tap this chute of ore. On the Calumet, belonging to the same company, they are down to the 300-foot level, where the ore chimney is stronger and better than at any place above. The ledge is seven feet wide, and it is not known how long. The ore is worth about \$75 per ton. The company are doing only development work on their mines, and simply taking out such ore as is cut in such work. The Lion has improved much in the past two weeks on the bottom, or 350-foot level, where a drift south has been driven fifty feet through ore eighteen to twenty inches wide, one-half of which is solid galena. It is being worked under lease by two men who, with the help of a third person, are taking out a ton of \$80 ore per day, which is certainly a splendid result for a mine under lease. Regarding the Honerine, Mr. Mitchener said they were retrimbing and doing dead or development work at present, and not extracting ore. Within the past three weeks they made an important strike on the 100-foot level, into which they drifted forty feet and were still in ore from four to five feet wide. A winze is now being sunk on this to open an air passage, so they can work to better advantage. The company are running their concentrator at present on ore from the Catherine, belonging to the Fritz Hill Mining Company of Chicago. The mill concentrates fifty tons of ore per day to ten tons of concentrates, averaging sixty per cent lead and sixty-five ounces of silver, making the value about \$100 per ton. The owners of the Catherine are clearing about \$10,000 per month out of their property. Regarding shipments of ore from Stockton, Mr. Mitchener says it is now about 1000 tons per month, and he believes that during the summer it will average 3000 tons. The Mono is being developed by Matt Gibson, who takes out enough ore to pay expenses, and is looking to the future for a great bonanza in the Mono, which in the past was such an immense producer, but has been idle for several years.

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 Fremont Street, San Francisco.

Manufacturers of NEW and Dealers in SECOND-HAND

Boilers, Engines and Machinery of Every Description.

PORTABLE ENGINES AND BOILERS On Skids.

Each engine is fitted with a governor, steam and water gauges, heater, fuel brush, waste, blow-off cocks, brass whistle, smoke stack with spark arrester, oil cups, gauge cocks, combination check and stop valve, and pump.
Both boiler and engine are fitted in complete running order, and are sold either mounted on strong wheels with wide tires, or on skids.

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be discarded from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

Assayers' Materials,

MINE and MILL SUPPLIES,

CHEMICAL APPARATUS and CHEMICALS, DRUGGISTS' GLASSWARE and SUNDRIES, ETC.

114-118 Pine Street, - San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price. Our New Illustrated Catalogue, with prices, will be sent on application.

Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for Plumbago Crucible Co., London, England.

ARTIFICIAL STONE PAVING CO.

(SCHILLINGER'S PATENT.)

—FOR—

SIDEWALKS, GARDEN WALKS, CORRIDORS, OFFICES, CARRIAGE DRIVES, STABLES and CELLAR FLOORS, KITCHENS, Etc.

The Courts here and in the East have decided that Artificial Stone Pavements with plastic concrete and in detached blocks, are infringements on the Schillinger Patent; and also, that when the plastic material is blocked off with a trowel and cut through far enough to control the cracking caused by shrinkage, that such pavement is in law the same as if laid in detached blocks, and is an infringement of the patent. All property-owners having such pavements laid without the license of the above Company, will be prosecuted.

BRETT'S

Oxidizing and Chloridizing FURNACE.

A Continuous Furnace for Working the Most Rebellious Ores.

For full description of this furnace see MINING AND SCIENTIFIC PRESS of Jan. 30, 1886, or address the inventor for circular.

The main features of the furnace are as follows: The self-discharging dust-chamber and automatic return of the cylinder when not sufficiently chloridized. A saving of a large percentage of salt. Saving in weight of cylinder, which is short, as the greater part of the sulphur is eliminated in the stack. There is less volatilization by desulphurizing without salt. A higher percentage of chlorination can be obtained by first desulphurizing, as shown in the report of the Navajo mine, at Tuscarora, Nev. The separate fires give opportunity for perfect control of heat, making it easy to roast the most rebellious ores. By the constant motion of the pulp while being desulphurized, there is no danger of matting. The combination of flues and dust-chamber makes the construction comparatively cheap.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

MINING MACHINERY.

San Francisco: Chicago: New York:
127 First Street, 100 N. Clinton, 145 Broadway,

PLANTS FOR GOLD AND SILVER MILLS,
embracing machinery of LATEST DESIGN and
MOST IMPROVED construction. We offer our cus-
tomers the BEST RESULTS OF 35 YEARS' EX-
PERIENCE in this SPECIAL LINE of work, and
are PREPARED to furnish from SAN FRAN-
CISCO or CHICAGO, the MOST APPROVED
character of MINING AND REDUCTION MA-
CHINERY, adapted to all grades of ores and SU-
PERIOR to that of any other make, at the LOWEST
POSSIBLE PRICES.
We are also prepared to CONSTRUCT and DE-
LIVER in COMPLETE RUNNING ORDER,
in any locality, MILLS, CONCENTRATION
WORKS, WATER JACKET SMELTING
FURNACES, HOISTING WORKS, PUMP-
ING MACHINERY, ETC., ETC., of any DE-
SIRE CAPACITY.

**WATER JACKET SMELTING
FURNACES**

For COPPER and ARGENTIFEROUS LEAD
ores of NEW and ORIGINAL DESIGNS, covered
by LETTERS PATENT. No other Furnace CAN
COMPARE with these for DURABILITY, and in
CAPACITY for uninterrupted work. MORE
THAN 150 of them are now RUNNING in various
parts of THIS COUNTRY, as well as many in
FOREIGN COUNTRIES, giving results NEVER
BEFORE ATTAINED as regards CONTINUOUS
running, ECONOMY of fuel, AMOUNT and QUAL-
ITY of BULLION produced. These CLAIMS have
been PROVEN BY RESULTS in ANY NUM-
BER of INSTANCES, and the GREAT SUPE-
RIORITY of this SYSTEM of smelting ores DE-
MONSTRATED BEYOND QUESTION. COM-
PLETE PLANTS furnished to order of any CA-
PACITY, with ALL IMPROVEMENTS that ex-
perience has DEMONSTRATED as VALUABLE
in this class of work.

Beyond question the cheapest and
most effective machine of the kind
now in use adapted to all grades and
classes of ores.

This machine has been THOROUGHLY TESTED
for the past TWO YEARS, under a GREAT VA-
RIETY of CONDITIONS, giving most EXTRA-
ORDINARY results FAR IN ADVANCE of
anything EVER BEFORE REALIZED. A re-
cent COMPETITIVE TEST at the Carlisle Mine in
Mexico, showed an ADVANTAGE OF OVER 30
PER CENT in favor of THE DUNCAN. The
amount SAVED OVER THE TRUE being suffi-
cient to PAY THE ENTIRE COST of the ma-
chines EVERY MONTH of the YEAR. One
of its MOST VALUABLE features is as an AMAL-
GAMATOR. It saves all THE AMALGAM GOLD
and SILVER that ESCAPES the BATTERIES,
PANS or SETTLERS, making the machine worth
MORE than ITS COST for THIS PURPOSE
ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist-
and affording means for the continuous operation of a
Pump or Blower, without interfering with a hoisting ap-
paratus. It is made entirely of iron, no piece weighs
over 300 pounds. At the ordinary speed of a horse, a
1,000-pound bucket of ore may be raised 130 feet per
minute. The hoisting-drum is under the complete con-
trol of the man of the shaft, and is capable of carrying
500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.**

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS.
(\$575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

Working Gold and Silver Ores.

Cheap Methods for Prospectors and Miners—No. 1.

There are many places on this coast where miners or prospectors are waiting for stamp mills, while if they went about it energetically they could work out their own salvation with arrastres or Chilian mills. These appliances are by many considered "primitive," as they are old-fashioned, but anyone who has had experience with them will vouch for their efficiency and activity. They do not work as fast as quartz mills, but by their means more gold or silver is saved. These appliances are found in the most perfect form in Mexico, where thousands are in use to-day, and no one can deny that the Mexicans know how to work ore as well as any metallurgists in the world. Mr. E. C. Van Blarcom, now of Oakland, who spent some years in Mexican mines, furnishes us with some drawings and notes made while there, which give many interesting details of the methods of working these appliances, and working ore in them. The arrastre may be described first, and the Chilian mill, settlers, etc., in next week's PRESS.

The Arrastre.

The bed of the arrastre is made much the same as the bed of the Chilian mill (hereafter described), with precautions to make it tighter. The paving stones should be laid on a bed of well-puddled clay from three to six inches thick. The stones for the pavement should be laid as closely as possible and the joints well tamped with clay.

Directly in the center of the arrastre a fairly large sized stone must be laid; this is to serve as the step for the peon or pivot. The step may be a small hole sunk in the rock, or an iron step may be let into the stone. The sides of the arrastre are made as in the Chilian mill, any holes being tamped with clay.

The peon is made from any convenient piece of timber. It can be made from two pieces of four by eight inch stuff, clamped together with iron bands. A hole is bored in the bottom of the peon and a piece of two-inch round iron, worked off to a rounded point at the lower end, is let in. This is the pivot on which the machine revolves. The end of the peon should have a wrought-iron collar to keep it from splitting.

Through the peon, at right angles to each other, are passed two pieces of four-inch square stuff, or small saplings dressed down will serve very well. One of these, *h* (Figs. 1 and 2), extends out from the peon seven feet six inches. To it the mule is attached and it is made to rotate in the direction of the arrow. To the other bar, *c* (Figs. 1 and 2), are attached the mullers or grinders, *g* (Fig. 1).

The grinders are of stone dressed out roughly with a stone mason's hammer. They are prismatic in shape, 36 inches long and about 15 inches wide on the grinding face when new. The stones should be dressed so as to throw the center of gravity below the center. This will keep the stones from turning over when the machine is in motion.

At the upper edge of the front face in each stone two plug holes, about six inches deep, are drilled; to these holes are fitted plugs of dry sugar pine; when these plugs get wet they will swell, and it will be almost impossible to remove them. A knot is left on the projecting end of each plug to keep the ropes, by which

they are attached to the cross-arm, from slipping off.

In attaching the grinders to the cross-arm, one should be attached so as to work close to the outside edge of the arrastre. The outside end of the stone should work in advance of the

made in the timber, *a*, (Figs. 1 and 2). By means of a wooden link, *f*, and pins, *e*, the collar is secured to the timber, *a*.

The timber, *a*, must be long enough to clear the mule walk.

When the arrastre is under cover the ends of

DETAILS OF CONSTRUCTION OF ARRASTRE.

inside end. This will throw the charge toward the center. The reverse of this arrangement should be observed in setting the other stone.

The upper end of the peon is worked into a pinion four inches in diameter; this pinion works in a hearing collar, *d*, (Fig. 1) made from a piece of two by eight inch stuff; near each end of the collar a mortise one by three inches is carried through; corresponding holes are

the timber are built into the side walls of the building. If there are no walls small columns of masonry can be built up to receive the end of the timber.

In whatever manner the timber is secured care must be taken to have it rigid. With an arrastre 10 feet wide two mules can be used, and the charge should be 600 pounds. Grease must not be used on this machine.

The Big Bend Tunnel.

The greatest tunnel enterprise ever undertaken in this State will probably be brought to completion next week. This is the Big Bend tunnel on Feather river, 16 miles above Oroville. The tunnel is 12,000 feet long, 16 feet wide and 9 feet high; at the upper end it is 32 feet wide. The fall is 30 feet to the mile. The tunnel is cut across the head in the main Feather, and will free the channel from water for a distance of fourteen miles. This channel is the bottom of an immense canyon, and is believed to be exceedingly rich in gold deposits. What few bars have been worked have been found rich, and the river above and below has paid its millions. The nature of the ground has heretofore prevented working in the canyon, as the river could neither be wing-dammed nor flumed. When the tunnel shall have been completed a dam will be built across the Feather sixteen feet in height about 100 in length. This will turn all the water into the tunnel that it can carry, and whenever all the water in the river is sent through it the 14-mile head of the river will be open for mining operations. In stages of high water the surplus will flow over the dam and mining operations below will necessarily cease. The company has been three years and four months building the tunnel, at a great expense. Superintendent Harris is of the opinion that better and quicker work was never done under similar circumstances.

The work is done by Burleigh drills which have been in every way satisfactory, the records showing great efficiency at low cost. The record of the month of March is as follows:

Total number of holes drilled, 914; total depth of holes drilled, 5,468 feet; average depth of holes drilled, 5,982 feet; number of pounds of No. 1 powder used, 3,150; number of drills sharpened, 1,268; time occupied in drilling, 140 hours, 25 minutes; average time per shift, 1 hour, 31 minutes; number of carloads of rock extracted, 3,815.

The tunnel was advanced during the month of March, 340 feet; previously reported to March 1st, 11,567 feet; total tunnel built to April 1st, 11,907 feet. Number of working days, 31; number of shifts worked, 93; average progress per shift, 3655 feet; average progress per day, 10,987 feet; average number of drills per shift, 13.6; average number of cars per shift, 41; tunnel to complete (April 1st), 100 feet. For the past month the rock has been principally slate. During the last ten days of March the rock was broken, needing timbers to hold it up. The superintendent expects to see light through the end of the tunnel about the 15th. We shall shortly give a description of this enterprise, with such details as are of interest to the mining public.

The outlook for the mining interests in Idaho was never so promising as at present. In eight of the fifteen counties in Idaho there are prosperous mining camps, and as the work of prospecting and developing goes on, each year adds to the number of paying mines. Until recently Idaho has been isolated, but with three railroads now traversing the Territory the mining camps in all the counties are easily reached.

TEO BECHMAN struck a very rich pocket at Spring Gulch, about four miles south of Big Oak Flat, Tuolumne county, last week. He has taken out over \$10,000.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

A Hole-in-the-Ground "Pome."

[Written for the Press.]

There was a man, Jack Shay by name,
Who prospected for gold,
But did not care a cent for mines,
Unless they could be sold.

His hair was long, his garb was rough,
Quite often he was "broke,"
But when he joined a poker game,
His was a winning stroke.

He had a bright but furtive eye,
A bold and reckless will;
His conscience was some dead, hard thing,
Beyond the preacher's skill.

When clambering over rugged hills,
Jack found a bunch of ore;
And planned to "hook" a moneyed man,
Its treasures to explore.

One day Augustus Percy Dod,
A New York millionaire,
Looked into Shay's square prospect hole,
And fancied something there.

It had a dainty "salted" vein,
With rich ore full in view;
Which Jack had "cribbed" from well-known mines,
To make his sale "go through."

Then Colonel Dod hired an expert,
With "M. E." to his name;
Whose talk of "metalliferous ores"
Had brought him frontier fame.

"Professor" Spiggins viewed the claim,
Through spectacles so clear,
That he could see a tempting prize,
Approaching very near.

Said he in tones well understood,
"Look here, shrewd Mr. Shay,
My word can sell this ground-hog's hole,
But I must have my pay."

"How much," asked Jack, "speak out at once,
I'm always on the square;"
"Five thousand will the sale complete,"
"All right—the payment where?"

"I'll get the coin from your own hand,
The day the bank pays you."
And so it came that this "M. E."
Did "float" the Merry Blue.

In his elaborate report,
He showed his wondrous lore;
And used such tongue-disturbing words,
As ne'er were heard before.

Said he, "this lode is mineralized,
E'en to its very core;
Free gold in cupricaceous form,
Gems all its finest ore.

Its matrix cyanized and strong,
Its tenor down will hold;
Its hypogeanous cubes
Are rich in vitious gold."

This bright report pleased Colonel Dod,
Who sought no higher skill;
But fearing Shay might now "back out,"
Made haste his check to bill.

The price was paid, a large round sum,
Which Jack expressed that day,
Then galloped off, ere the expert
Could come to get his pay.

Jack Shay is now a city snob,
And owns a broker's seat;
Perhaps he may again come west,
And beans and bacon eat.

In his old camp his fame is great,
None doubt his master-skill;
Such genius and such grand success,
With pride men's bosoms fill.

For twenty dollars Ashengab
Helped Shay by printing lies;
Then claimed his *Weekly Bugle Snort*
Gave Dod a marvelous prize.

And Percy Dod in corporate form,
Joined great names to his own;
And "milked the street" that he might build
A huge bonanza throne.

And later still, when work had "smashed,"
The barren Merry Blue;
The *Bugle Snort* pronounced it rich—
A fissure, deep and true.

'Tis through such acts that mining flags—
That it is gambling thought;
And mines that promise good returns
Lie idle and unbought.

But time will wear out cheats and stocks,
If greenhorns cease to buy;
And ore will be the miner's crop,
"As good as wheat" or rye.

JETHRO JETHRINGTON.

Weight and Drop of Stamp.

EDITORS PRESS:—I noticed an article in your columns of some time since, relative to stamp mills, and that weight is the most profitable for mine owners. I have been in the quartz milling business for 21 years. I have had many opportunities of testing the capacity of different weight stamps, and the proper way of working them up to their full capacity. My experience teaches me that stamps weighing 1000 pounds to the stamp should have a double discharge, a 400-pound stamp mill or 600-pound stamp will

will discharge through a single screen as fast as the latter weight can crush. Eight years ago I had an opportunity to test the difference between double discharge and single discharge batteries with the same weight of stamp. A 900-pound stamp of five stamp battery crushed with a double discharge through a No. 40 screen, 14 tons per 24 hours; drop 90 per minute and with same drop with single discharge only pulverized 10 tons per 24 hours; therefore, heavy weight stamps are the most profitable for low grade mine owners. A ten stamp mill of 1000 pounds stamp will crush with double discharge 24 tons per 24 hours. Care should be taken that the stamp rise above the water in the battery before dropping so as to create a splash; otherwise the screen will get choked or clogged up so as to prevent discharging freely. I find a great many millmen that do not allow the stamp to rise above the water before dropping. This will only cause a stop-over and will not crush as fast. My motto is to crush as fast as possible and provide well on the outside copper plates and sluices to save that which is discharged as it is easily done by using concentrators. I. C. F.

Redding, Shasta Co.

Butte County Mines.

Channels of the Dead Rivers.

EDITORS PRESS:—I thought it might not be inappropriate to drop you a few lines, in regard to the mining interests and prospects of this region. About one-half of Butte county is composed of foothills and mountains, which are vastly rich in timber and minerals; the other half contains the best wheat and orchard lands in the State.

I have been mining in this locality for the last 30 years; have noted all its strikes and failures, but wherever persistent effort, coupled with capital, has been brought to bear, it has been crowned with success. The Birch and Barrett tunnel that was worked away back in the fifties, paid enormous dividends, but owing to a difficulty in regard to drainage, it lay idle for several years. But John Barrett, one of the original owners, some 10 years ago put in a steam pump, and after drying the claim, opened up the best drifting digging in Northern California. After working it several years with splendid results, he sold out to Mr. Pershbaker, who is now working it successfully with powerful steam pumps to dry the channel. The gold is of a gross heavy quality, the pieces ranging from one dollar upwards. This channel poits in a southwestern direction, and runs under the great lava-capped mountain that divides the west branch of Feather river from main Butte creek.

Under this lava cap of the mountain lies a stratum of gold-bearing gravel from six inches to many feet in depth. Of course the gravel is thicker in the center of the original channels that laid their deposits so many millions of years ago, but the imperishable gold lies there in its silent tomb, awaiting resurrection by the persistent energies of man.

About two miles below the Pershbaker mine the channel of an ancient river crosses Little Butte creek, coming from the northeast, from the great granite basin of Plumas county, and pointing to the southwest. The channel of this dead river is perhaps 1000 feet wide from rim to rim, filled with smoothly washed boulders of quartz, granite and marble. The Little Giant Company sunk a shaft on it to the depth of 200 feet, but as yet have not been able to find the bottom.

Two miles further southwest the Wiley Bros. have found a rich deposit of coarse gold, which is supposed to be on the same channel or a tributary of it.

The late Thomas H. Blythe, of San Francisco, started the Mammoth tunnel on the southwest side of the mountain to probe the bed of this great channel.

The tunnel was driven about 1000 feet into the hill, and from late developments he was on the proper course, but since his death the work has not been pushed forward to completion.

From recent developments made in the Hupp claim which joins it on the south, he would not have to run more than 400 or 500 to reach the channel. The Hupp claim just mentioned is a hydraulic claim, and has been worked every winter since 1870, until about two years ago, when it was purchased by the Butte Creek Hydraulic Mining Company of San Francisco, who had constructed a large ditch from main Butte Creek. They completed their ditch down to the bill, and turned their hydrants or giants upon the immense body of gravel that juts out on the southwestern side of the lava mountain, some three miles southwest of the Little Giant shaft. This great mass of gravel stands from 50 to 150 feet in depth, and is composed of granite quartz and marble boulders smoothly washed.

This company under the superintendence of Mr. Wait, has built big brush dams below their claim to impound their tailings, so as not to injure the farmers below in the valley.

I visited the claim the other day, and was astonished at the progress they have made since opening their water battery on the hill. On the south side they have piped up quite near the great lava bluff that caps the gravel deposits. The hill has been piped off around its

base in the shape of a delta, until they have reached a gorge in the mountain, and to all appearances have dropped into the edge of an immense channel that has been cut by this sweep of a large river perhaps millions of years ago, pointing like all the submerged channels of this region, southwest and northeast.

I saw some fine specimens of gold piped out from the edge of this channel that were simply grand to look at. It is of a coarse quality, smoothly washed and stained of a dark color; it is similar to the gold found by Pershbaker, Wiley and others from croppings or tributaries of the channel of this great dead river—the tomb of fabulous wealth.

This hydraulic company having struck into the southwestern end, or outcome of this channel, when they bottom it, as they no doubt will, can work, it by this drifting process, as they will have an up-grade to work on.

These dead river channels, and there are four or five prominent ones in this county, with the exception of Cherokee Flat, remain comparatively undeveloped. They will mostly have to be worked by drifting.

The great mother quartz belt of the State has been traced from Grass Valley, Nevada county, in a northwestern direction by way of Smartsville, Oregon Gulch, Cherokee Flat, Sawmill Peak, and thence up to Meredith's quartz claim, on Big Butte. At Yankee Hill, near Cherokee Flat, on the line of the belt, was found a quartz boulder weighing 150 pounds, one-fourth of which was gold. At Sawmill Peak, ten miles further northwest, on the same line, was found a solid chunk of gold weighing 56 pounds, in the Willard claim.

All the channels of these dead rivers cut this mammoth belt at right angles, and precipitate themselves to the southwest into the Sacramento valley; hence it is no wonder that they are very rich in the auriferous substance, as it is the action of water that brings gold together after it leaves its mother quartz.

The Butte Creek Hydraulic Company has made a discovery that will no doubt lead to the unearthing of millions of the needful, and in the near future give employment to thousands of men; it shows also that mining in this region is just in its infancy.

Centerville, Butte county, Cal.

Hints for Lubricating.

EDITORS PRESS:—The Boston Manufacturers' Mutual Fire Insurance Company has adopted a standard of a perfectly safe lubricating oil, which is that it shall have a fire test of 300° and, at a constant heat of 140°, evaporate not more than five per cent of volume in 12 hours. Such an oil, it guarantees, is perfectly safe from all risk of spontaneous combustion, and concerns using it are more insurable than those using pure animal or vegetable oils.

It is encouraging to see so much sense on the part of insurance companies. Although, to do justice, practically there has never been any inclination to distinguish against pure mineral oils. There have been recently five cases of spontaneous combustion from mixed neat's-foot oils. If such oils are used, great care should be taken that they be kept in a safe place and condition.

The time will come when it will be considered ridiculous to mix or adulterate any mineral oil with an animal oil.

Regarding the standard of oil above described, purchasers of lubricating oils need only be careful of observing the first requisite, viz., that the oil shall have a fire test of at least 300° Fahr. That is easily shown by an ordinary test with alcohol lamp. The second requisite, viz., that of evaporating not over five per cent of volume in 12 hours, need not be heeded, as every oil which satisfies the first test is certain to satisfy the second. CHAS. J. WOODBURY.

123 California St.

SENSE OF SMELL IN INSECTS.—Professor Graher has made an extensive series of experiments on the degree and localization of the sense of smell in insects, etc., from among the results of which the following will be found of interest: Odors are perceived by many invertebrates, such as mollusks, insects, etc., with extreme rapidity, sometimes in one-third of a second, and even through an intervening layer of water a half-millimeter in thickness. Insects deprived of their antennae are still able to smell, but in varying degrees in different insects and for different odors. In some cases the palpi of the mouth organs are more sensitive than the antennae, and therefore the latter cannot be considered as being alone the organs of smell.

THE ATLANTIC AND PACIFIC GRANT.—It was telegraphed from Washington on March 24th that the Secretary of the Interior has rendered a decision in the case of the Atlantic and Pacific Railroad, in which he holds that he has no legal claim to the land along the line of the road from San Buenaventura, on the Pacific ocean, California, to San Francisco, and directs the Commissioner-General of the Land Office to restore the same to the public domain. The fact that this line has been mortgaged and money raised on its credit, is, the Secretary adds, a misfortune to the mortgagees, in that they took a mortgage on land to which the mortgagees had no legal right. The decision restores to the public domain 2,451,200 acres.

Is Our Population Increasing Too Fast?

Some of our contemporaries are greatly exercised because immigration to this country appears to be falling off, while others are moving heaven and earth, organizing immigration societies, and urging capitalists to raise money to send agents to Europe, and elsewhere, to make known the barrenness of our country in population, and the opportunity which is offered here to buy and build up homes. This country is represented as a paradise, for both the poor and the rich;—and so it is. There is no place in the wide world which presents such opportunities for poor men as the United States. We have an abundance of land while high wages everywhere prevails—when men can get work. Neither is there any place where capitalists can make so much money out of coming immigrants as here. They buy up land by the hundreds of thousands of acres, divide it up into farms and town lots and sell it to the poor emigrants for two, three, and four times as much as it cost them. And still the land is much cheaper and better than any which can be bought in the "old countries."

All this and more is true. But are we not rushing things too fast? It is one of the characteristics of the American people that they nearly always overdo whatever they take in hand. Are we not rushing too fast into this immigration business? Let us look ahead a little and make a few figures.

Our population doubles every 33 years. At that rate of increase the population to the square mile in the United States will reach that of Europe, at the present time, in 83 years.

But supposing there should be a falling off in the increase to such an extent that our population should require 40 years to double. Even with that slower rate of increase we should reach the density of the present population of Europe in a fraction short of 100 years.

Now what does such an increase mean? What is the present condition of the people of Europe in regard to population? Why are people leaving that continent by thousands and coming to this country? Is it not because of the manifold evils arising from the density of population there—because there are too many people to the square mile? Most certainly such is the case.

Is it then a wise course on the part of our people to hurry up our population by artificial stimulus, so as to bring this continent, also, into the same unfortunate condition in less than one hundred years? Have our political economists made or thought of these figures; has it occurred to the masses of our people that we shall reach the overcrowded condition of Europe within the lifetime of some of our children now living? Is it desirable that, within the brief space of less than 150 years, our population shall be more than twice as dense as that of overcrowded Europe at the present time? In holding out special inducements for immigration hither, are we not surely fastening upon our immediate posterity all, and perhaps many more, of the ills that now afflict overcrowded Europe and Asia?

The above and many other conditions which must surely follow our present policy in regard to population, are matters for the most serious consideration of the American people. We append, as pertinent to the above, the following truthful utterance of Adolph Mentser, a rich Amsterdam merchant, who, though a large capitalist, has resolved to get away from the terrible struggle which is not only pending, but which has been actually inaugurated in Europe. He says:

"Europe has swarmed; its hives are no longer capable of holding its starving millions. Men cannot live on wind. This is the cause of the present London terror—the empty stomachs of its agrarian and socialistic mobs demand bread. Matters in this respect throughout all Europe will grow worse. Hence I consider capital and life there no longer safe. Therefore I come to America for safety."

The Amsterdam capitalist talks sense; but we fear he is fleeing from evils seen to those he knows not of.

FOREST LAWS IN INDIA.—A recent report to the British House of Commons showed that by the operation of forest laws in India, where there was formerly a terrible waste of timber, the revenue from forests has increased tenfold, yielding a net profit of \$2,000,000. The experience of other countries exhibits equally good results. It has been difficult to arouse public interest in the subject of forest preservation in this country, but the time is not far distant when the deficiencies in the present policy of the country on this matter will become glaringly apparent.

RUSSIAN LABOR RESTRICTIONS.—The Russian Government has issued a decree, prohibiting, for a term of three years, the employment of women and children under the age of 17 years in cotton, linen and woolen factories. This step has been taken so as to reduce the output of textile manufactures and put a stop to overproduction.

THERE is considerable excitement over the fact that petroleum has been discovered a few miles north of Albuquerque, N. M. The exact flow is not known; but it is said that the quality is very superior.

MECHANICAL PROGRESS.

Tempering Taps and Other Small Tools.

In some shops, and particularly so in the smaller and less pretentious ones, says *American Engineer*, we are often called upon to form and temper our own tools. To do this and make a successful job, it often seems as though one must be blessed with a run of good luck, in addition to his usual dexterity. Now then, to make and temper a tap for instance, is very easy said, but not so easily done; and as we have been having some exceptional success in tempering these articles in a common blacksmith's fire without the use of charcoal, we thought that perhaps our method of procedure might be of some use to our readers if they have not already tried it. In the first place, in drawing down the steel to the proper size, of course care must be taken not to overheat the steel, though it may be manipulated under the hammer until it is so cool as not to show its redness, with good effect, if the blows are not too hard. Having turned up the tap, fluted it and "backed-off" the thread, polish it, taking care not to injure the cutting edges, you will then be ready to temper it, and we have found the following a handy arrangement for heating in a blacksmith's fire: Take an old piece of steam pipe, or other iron cylinder, about 15 or 18 inches long, and large enough to admit of the tongs holding the tap being passed into it. Plug up one end of this pipe solid with some non-combustible substance, such as a bit of clay, and bung it in the fire with the open end toward you and slightly higher than the closed end. Take care that no bits of coal get down into the pipe. Now, grasp the tap by the square end made for the reception of the wrench (in no case must it be held by the threaded end in the tongs), and as you see that the pipe is red hot insert the tap, and by turning the tongs keep the tap slowly revolving in the pipe, and when it looks as though it were red hot pull it out and thrust it into a nail-peg or some handy dark corner and see if it is heated all over evenly. This is important. By a little attention you will soon get in the way of noting the cooler portions by their slightly darker color. Repeat these operations until you are sure you have an even, but not a high heat (say a dull red), then plunge the tap point downward into a bucket of clean, soft water, and hold it still until it is as cool as the water. With a few times trying you will find this an easy way to harden a tap or other small tool in a common fire without risk of burning or otherwise injuring the steel. Now, polish the shank and flutes of the tap as before, and by again inserting it into the hot pipe you can easily let down the temper to any degree of hardness required. In the latter case do not have the pipe too hot, as it will make a better tap to let the temper down slowly and evenly.

Economy in the Workshop.

The waste of power, wear and tear of banding, belting and machinery, and consequent faulty product has occasioned much trouble and of late much controversy. The cause of these difficulties are various. Varying weight of machinery on the engine, not regulated by the governor, and unknown to the foreman is the cause of much of the trouble. All this can be remedied by the use of power scales, which will at once detect the power actually required for devising the machinery, or point out the place where undue friction exists, or where gross mistakes have been made by inexperienced interpretation or faulty adjustment. All such errors and hindrances can now be pointed out so plainly that "he who runs may read" and know just what to do to secure the largest and best results from the least power. To this may be added the relative merits of low and high speeds for engines and machinery from the standpoint of economy. Of late the relative merits of low and high speeds for machinery, considered from the standpoint of economy, have frequently been made subjects of grave consideration. There is abundant evidence to prove, however, that no great weight has been thrown on either side, and there is now almost as much diversity in practice as there has been at any time. Of late, there has been a growing tendency to adopt higher speeds than have ordinarily been employed for some purposes; but the advantages thus gained have been confined to only a few, and the low-speed evil remains yet to be conquered. Examples of slow shafting and belt speeds often prevalent in machine shops have frequently given rise to severe criticism. Doubling the speeds now generally used has been advocated in more than one instance, with the promise of satisfactory results, and cases are by no means rare where the idea has been successfully carried out. With increased attention to the waste of power entailed by improper arrangements of shafting and belts, the important function of speed will gain fuller recognition, and power users will then begin to appreciate the extent of the losses that they have suffered.

SOAKING PITS FOR TIRES.—The Osnabruck Steel Works are making use of "soaking pits" for the slow and uniform cooling of the tires after rolling. The pits are constructed in the ground, in the usual manner, of firebrick material, and are of such a size that they hold 12 tires, one placed on top of the other. The tires

are taken to the pits directly; they are rolled by means of traveling cranes, and are left to cool for three or four days in the closed pits. Experiments have proved that tires cooled in this way have 50 per cent greater strength than those cooled in the usual way, in ashco, or simply exposed to the air.

THE SPEECH OF THE EYES.—Professor Hugu Maguass recently delivered in Berlin a lecture on "The Speech of the Eyes." First he showed how various thoughts and emotions may find their expression through the eyes, how rage, joy, sadness, sympathy, all may be indicated by one look, and how a question may be asked or he replied to simply by one scarcely observable movement of the eye. But the most interesting part of his lecture was, says the *Medical and Surgical Reporter*, a point with which many a physician may not be acquainted, not from ignorance, but simply because he has never given the subject any thought, viz., the fact that the various expressions of which the eye is capable are not at all made by the eye itself, i. e., by the eyeball, but by the movements of neighboring parts. The eye itself may be stationary, not the least motion may be observed in it, and yet the raising of the lids expresses our surprise, half-closing them together with contraction of the brow indicates our displeasure, and a peculiar movement of the lids, and the parts around the nose together form what we are in the habit of calling "a merry twinkle." Many a one who will read these lines will at once acknowledge that such is the case, and that the facts are as stated, but at the same time he will acknowledge that he had never thought about it, and had never imagined that as all the manifold expressions which we ascribe to the eye—the mirror of the soul—the eye itself has no share. When a criminal has his character pictured in his eyes, it is not they that tell us the moral depravity of the man, but the play of the neighboring muscles, which, perhaps, for years, always obeying the impulse from the brain form together the group we call physiognomy.

ARE WE OBLIGED TO GO ABROAD FOR OUR WIRE ROPE?—In the report of W. S. Schley, of the Navy Department, addressed to the Secretary of the Navy, Oct. 16, 1885, this statement appears: "The Bureau has been obliged to purchase abroad the steel-wire rope for the new cruisers on account of its inability to have wire of the necessary tensile strength, elastic range and ductility manufactured in the United States. A contract was entered into during the year with a firm in Massachusetts, but after several failures had been made the Bureau was obliged to discontinue the contract. Rope manufactured abroad and delivered at the New York navy-yard costs about 60 per cent less than the lowest offer received for the wire alone in this country." Present appearances seem to indicate that the cost of strikes, lock-outs, high wages, etc., all of which the workmen eventually have to pay for, will soon render it necessary to go to Europe for the bulk of our iron and many other goods, while our own workmen are left to suffer in the midst of what might be plenty and prosperity.

THE STEEL QUESTION.—The opinion is freely expressed in British iron circles that the new works which are being erected for the manufacture of mild steel in England, will overdo the work fully as much so as has already been done in the case of Bessemer steel. Especially is this the case, in view of the indication that ship and boiler builders will, for some time to come, look to Siemens' steel as the most valuable and reliable material for their use. It is generally held that Scotch steel "is the best in the world for all purposes requiring strength and ductility." Indications might, however, be adduced, that even "the best steel in the world" is not always wholly reliable. Still, it is undeniable that the general reliability of open-hearth steel has largely contributed to the recent extraordinary development of modern engineering and general construction, and that the development will continue to the advantage of the mild steel makers.

DISINCRUSTING BOILERS.—The latest method of disincrusting boilers patented in Germany, claims to be free from chemicals and to require no supervision, thus being costless. The feed-water is forced through one of the usual feed contrivances into the steam dome, in which it is mixed by a jet of steam entering concentrically in order that it may during the mixing be cast violently against the cover of the dome. The effect of this movement is that all the water receives the full temperature of the surrounding steam. By this sudden heating (to 150–180° Cel.) air and carbonic acid are withdrawn from the water, and not only the carbonate of lime, but also the sulphate of lime and magnesium are extracted, and the precipitate occasioned is periodically removed.

IRON NOW AND THEN.—It is often observed that iron of recent make rusts and wears away much more rapidly than samples made forty or fifty years ago. The observation is not illusive and the reason of the more rapid deterioration of much of the iron of a late make arises from the fact that it contains more impurities than formerly. The common iron of to-day is filled with slag, and looks coarse and fibrous when rusted or worn. Fifty years ago the iron made in the United States was largely charcoal iron, and was much purer and better than the same grades made at the present day.

SCIENTIFIC PROGRESS.

A Peculiar Illumination.

A brilliant phenomenon has been noticed at Beaver Falls and other places in Western Pennsylvania, where natural gas blow-off pipes send out their large volumes of flame into the frosty night air, which has aroused particular interest both from its beauty and the absence of any fully satisfactory explanation.

At those works which receive their supply of natural gas directly from a well, and are running only during the daytime, the gas is permitted to escape into the atmosphere at night, and to avoid the roaring sound is usually ignited as it issues from the top of the blow-off. These gigantic torches light up the country for miles around, the effect being particularly noticeable in cloudy weather, when the glare is reflected. It has been observed that in certain conditions of the atmosphere a vertical, feathery and very brilliant arrow of fire extends above the flame almost to the zenith. Its greatest brilliance is perhaps at its highest point, where it is described as being quite as bright as a rod of iron at a white heat. The natural pulsations of the gas, as it rushes from the blow-off, affect the outpouring flame, and give the luminous arrow a leaping, flashing motion which adds greatly to its beauty. The observers agree in stating—and the fact is significant—that the conditions necessary for the appearance of the phenomenon depend upon the presence of a frosty atmosphere and an appreciable haziness, or else it is visible either during or immediately preceding a light, fleecy fall of snow, the temperature being somewhat below the freezing point.

Bearing these facts in mind, it is not difficult to explain the arrow. The minute crystalline faces of the suspended snow or ice particles catch the light from the burning torch, and reflect the rays in precisely the same manner as the ocean, or other expanse of water, on a moonlight night, gives us a long, silvery path of reflected moonbeams. This explanation finds further confirmation in the fact that the arrow extends only to the upper limits of the haze, and when the lower atmosphere is clear, begins at some distance above the flame.—*Scientific American*.

FLUID EXTRACT OF CAMELLIA.—Within the space of a few months, Dr. E. R. Squibb has called the attention of the medical profession to the fluid extract of camellia, or tea, which has been thus proposed to take the place of guarana and cocoa. He states that the testimony in regard to the effect of tea, coffee, Paraguay tea and kola nuts is all of a similar character to that given with regard to cocoa. Each of these substances appears to have come into use independently in widely separated countries, in order to produce the same effects, namely, to refresh, renew, or sustain the physical and mental organism; and it is a curious surprise to find that after they had been in use for a very lengthened period, and although each came from a different order of plants, the same active principle, namely, *caffeine*, could be extracted, in different proportions, from all of them. It is even more curious to find that for centuries past a plant called cocoa, yielding a different principle, has been in use for a similar purpose, the effects of which, says Dr. Squibb, differ but little from *caffeine*, "simply producing a similar physiological effect in much smaller doses." Comparing the power of these drugs in their tendency to counteract sleep, or promote wakefulness, the author found that three grains of *caffeine* were equal to three fluid drachms of the extract of cocoa and to seventy minims of the fluid extract of camellia. These seventy minims of the latter extract equal seventy grains of tea, and this yields a little over two grains of *caffeine*. These are Dr. Squibb's figures. Later, Dr. J. B. Andrews has reported on a long series of experiments with fluid extract of camellia and hydrobromate of hyosine in the treatment of insane patients.

PULVERIZED STEATITE.—As a finish or covering for walls and ceilings pulverized steatite is coming into use quite satisfactory. It is simply soapstone. It takes a high polish, is pearl gray in tint, is said to present the best possible surface for painting, either in oil or water color, and, what is very desirable, will neither crack nor chip. It is claimed for it that it is a non-conductor and non-absorbent; that it can be washed without injury; nails can be driven into it without damage; when subject to heat, moisture and chemical fumes it gives no smell; and it does not turn yellow with age. It is thought to be specially adapted for hospitals, factories, cellars, markets, etc.

MOTION AT REST.—One of the most astonishing of the many wonderful powers of the photographic instrument—our artificial eye—is the extreme rapidity at which it acts upon objects brought within its range. *Popular Science Monthly* makes the following reference to this power: We will suppose that everything is in readiness, that its retina or sensitive plate is in perfect condition, and that not a ray of light has yet entered within the darkened chamber. Instead of being "the twinkling of an eye," we shall arrange so that the time elapsing between the opening and closing of the artificial eye lid shall be less than one-thirtieth of a second, or far less than the time

necessary for our eyes to "open and shut." It shall be as nearly "instantaneous" as possible. Everything is ready. Click! It has opened and shut. What has it seen in that little instant of time? If anything is in motion, it has been perceived in that fragment of a second as motionless. Men walking along the street are pictured with uplifted feet. A trotting horse may be caught with all of its four legs in the air, viewed just at the moment when he was clear of the ground. A man leaping with a high pole may be pictured in midair, precisely in the position in which he appears at the highest altitude. Motion seems rest. But this even is not the most wonderful of its powers. Far beyond the keenest of human vision is its range of sight. If the light is good this sensitive plate of glass will have recorded and discerned a thousand uplifted faces as perfectly as the human eye perceives the features of a single countenance. Every expression of joy or sorrow, every peculiarity of dress or attitude, the leaves of a forest, or the grass by the wayside, will have been seen and delineated and retained perfectly in far less than the briefest possible twinkling of a human eye.

BOTANICAL INSTRUCTION IN THIS COUNTRY.—By a slow evolutionary process, botanical instruction appears to be undergoing a radical change in the United States, which concerns both its nature and methods. Whereas only a few years ago botany, as a college study, dealt chiefly with the flowering plants and vascular cryptogams, its scope has broadened, even in the limited undergraduate curriculum, so that the graduate of to-day is supposed to have been taught more or less about each of the principal groups of plants, from the lowest to the highest, if he has studied botany at all. With this change has come an earnest effort to make his knowledge a working knowledge, obtained in the laboratory so far as essentials are concerned and merely rounded out in the lecture-room. That Harvard University should be prominent in planning and introducing these changes is not surprising, for nowhere has botanical research and instruction been so favored in the the possession of the necessary means and of talented leaders in different branches of the growing subject.—*Science*.

COMBUSTION OF COPPER AND NITROGEN.—A curious phenomenon has been observed by M. Blondlot and communicated to the French Academy of Sciences. A disk of platinum and a disk of copper were fixed vertically in front of each other by help of two millimeter stands. The disks were three or four millimeters apart, and both were placed inside a bell jar of porcelain open below. The apparatus was then heated red hot for this process by means of a gas furnace, and although there was no electric current, it was found that the face of the platinum disk was blackened with a deposit containing copper and platinum. In short the copper had crossed to the platinum plate from the copper one. M. Blondlot by repeating the experiment in different kinds of gas found that the nitrogen of the air was the agent in this transport of matter. The nitrogen combines with the copper and lodges on the platinum, either incorporating itself with the latter or decomposing in contact with it under the influence of its high temperature.

ORIGIN OF THE ZODIAC.—The Egyptian zodiac, says Mr. Boscawen, which had furnished the French astronomer Arago with so much material by which to prove the Egyptian source of the zodiac, was now known to have only a Ptolemaic age, and still later came the zodiac discovered at Tanis, the ancient Zoan by Mr. Flinders Petrie. The numerous engraved gems and the carved stones, especially the valuable boundary stones, of a far more remote antiquity showed that the signs of the zodiac as known to us were known also to the Chaldeans. It is evident that from an early period the division of the heavens into twelve parts, presided over by twelve constellations, had been in use among the Babylonians.

DISCOVERY OF A NEW NEBULA BY PHOTOGRAPHY.—MM. Paul and Prosper Henry have recently announced the discovery by means of photography of a new nebula in the Pleiades. It was first photographed on November 16th last, and though it was again photographed on December 8th and 9th, MM. Henry have not yet detected it by direct telescopic observation. The nebula is about 3' in extent and "tres-intense." It presents a well marked spiral form, and seems just to escape Maia. Its position is as follows: R. A. 3h. 38 m. 57 s., Decl. 24° 1' N. The question is sometimes asked, which is the most sensitive to light—the human eye or the photographic plate? This discovery seems to indicate the superior sensibility of the chemical plate.

THE MAXIM GUN.—This new and wonderful weapon is a gun weighing only 65 pounds, mounted upon a light tripod, which can be lowered, raised, moved literally with one hand as easily as a garden hose, and which pours out automatically 600 shots a minute. There is no crank to turn; there is no labor of feeding. One man simply acts the bullets going and then directs it at will, raking a whole regiment front if he likes or keeping the fire within a range of five feet or five inches. The basis of it all is the utilization of the recoil force to fire the next shot.

TABLE OF CONTENTS.

EDITORIALS.—Working Gold and Silver Ores; The Big Bend Tunnel, 237. Passing Events; Hoisting Cables; On a Better Basis; Foundry Notes, 240. Legendary Lore of the Pueblo Indians, 241.

ILLUSTRATIONS.—Details of Construction of Auauere, 237. Rock Carvings Showing Records of Pueblo Indians, 241.

CORRESPONDENCE.—A Hole-in-the-Ground "Pome"; Weight and Drop of Stamp; Butte County Mines; Hints for Lubricating, 238.

MECHANICAL PROGRESS.—Tempering Taps and Other Small Tools; Economy in the Workshop; Soaking Pits for Tires; The Speech of the Eyes; Are We Obligated to go Abroad for Our Wire Rope; The Steel Question; Dishonesting Boilers; Iron Now and Then, 239.

SCIENTIFIC PROGRESS.—A Peculiar Illumination; Fluid Extract of Camellia; Pulverized Scatite; Motion at Rest; Botanical Instruction in this Country; Combustion of Copper and Nitrogen; Origin of the Zodiac; Discovery of a New Nebula by Photography; The Maxim Gun, 239.

ENGINEERING NOTES.—Electric Locomotive; A Magnificent Sewage Project, 243.

USEFUL INFORMATION.—Use of Sandpaper; What Can be Done on a Bicycle; A Prairie Fire Extinguisher; Zinc Paint; Welding with Bad Coal, 243.

GOOD HEALTH.—Killed by Swallowing Silk; Extracting Teeth with the Pistol; Oyster Poisoning; Influence of Hot Drinks on Digestion; Damp Beds; Cats as Bedfellows; Poisoned by Cocaine; Iron in Medicine, 243.

MISCELLANEOUS.—Is Our Population Increasing Too Fast, 238. Practical Hydraulics, 242.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Montana, Idaho, Utah, Colorado, Oregon, Washington, New Mexico, 244-45. MINING STOCK MARKET.—Sales at the San Francisco Stock Board. Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 243.

Business Announcements.

Insurance.—Fireman's Fund Insurance Company. Rubber Goods.—James F. Hough.

See Advertising Columns.

Passing Events.

The streams of the country are all very high now, and where the miners are allowed to work their gravel they have plenty of water. The water season this year will be a very good one, there being an abundance of snow stored in the mountains.

Southern Oregon mines are now attracting more attention than ever before. Many miners are at work there, and apparently doing well. The Oregon mining fields will be well prospect this year.

Idaho, too, is looking up again in her mining interests. Capital seems to be going into the Territory and helping the miners out, much to the advantage of many of the camps.

The low freights and fares between here and the East continue, and thousands of people are now visiting California. There will be more tourists in the State this summer than we ever had before in one season.

A custom smelter has started to work near Tombstone, and is a thorough success. Similar works will probably be started. The miners are very cheerful over the prospect of a return to lively times.

EXTRA EDITION.—We shall print a double sheet edition of the MINING AND SCIENTIFIC PRESS next week, containing much matter of general and special interest.

Hoisting Cables.

It was found by the census officials that out of 420 deep mines in the United States, 38 used flat steel cables, 171 round steel cables, 8 both flat and round steel cables, 180 used hemp or manila rope, and 17 both steel and hemp rope. In this State 42 out of 65 used round steel rope. In Nevada out of 73 deep mines, 27 used flat steel rope, 25 round steel, and 14 hemp or manila, while 7 used both metal and hemp. The manila or hemp ropes are used only in comparatively shallow workings and where moderate quantities of ore are raised. The largest reported in the State of Nevada was three inches in diameter, and raised an average load of 2,200 pounds, including weight of cage. The smallest was 1½ inches in diameter and raised but 250 pounds. Hemp and manila cables last from 3 to 18 months, and average from 10 to 12 months.

A few mines use round tapered steel cables. The tapered cables are 2½ inches at top and 1½ inches at bottom. While so far as the distribution of the load is concerned, tapered cables present a decided advantage; they are much less readily repaired, and cannot be reversed. They were much more used a few years ago than they are now.

A dozen or so years ago steel cables were introduced but slowly. Though their advantage was great they were apt to give out unexpectedly and without warning. The difficulties of making a steel wire suitable for the purpose have been overcome, and there are now but few iron cables left. For large cables the flat is preferred to the round. A heavy round cable must be wound on an enormous drum to escape injury by bending, while the flat rope can go on a reel of small width, and of no greater diameter than would be used for round. These advantages more than counterbalance the slight additional weight of metal necessary to obtain the same strength as the round cable would possess. The largest steel cable reported was one on the Comstock, ¾ of an inch thick and 8 inches broad, carrying a load of 15,800 pounds. The average load for steel wire ropes, except in Nevada, is a ton and a quarter, but on the Comstock it is about three tons.

The following is a partial list of Comstock hoisting cables, showing weight of load, average duration, particulars as to sheaves, etc., and will be of interest to all mining men:

Belcher.—Flat steel wire cables, 4 in vertical shaft, each 1,000 feet long, 3½ inches by ½ inch; 2 in incline, each 2,000 feet long, 5 inches by ½ inch. Average load, including cage, 5,300 pounds. Average duration, with repairs, 3 years. Sheaves, 50 feet high, 7 feet in diameter.

Belcher and Crown Point Pump Shaft.—In hoisting compartment, flat steel wire cable, 5 inches by ½ inch, 5,300 feet long; in pump compartment, round steel wire cable, 1 inch in diameter, 1,000 feet long. Average load, including cage, 5 tons. Average duration, with repairs, 4 years. Height of sheaves, 30 feet; diameter, 6 feet.

Crown Point.—Five flat steel wire cables, 5 inches by ½ inch; one round steel wire cable in incline, tapering from 2½ inches to 1½ inches in diameter. Average load, including cage, 5,500 pounds. Average duration, with repairs, 4 years. Height of sheaves, 18 feet; diameter, 7 feet.

Forman Shaft.—Two flat steel wire cables, one English make and one American, each 3,000 feet long, 6 inches by ½ inch. Average load, including cage, 5 tons. Height of sheaves, 50 feet; diameter, 10 feet.

Overman.—Flat steel wire cables, one 5 inches by ½ inch, 1,700 feet long; one 4½ inches by ½ inch, 1,700 feet long; two 4 inches by ½ inch, 350 feet long. Average load, including cage, 4,700 pounds.

Yellow Jacket.—Flat steel wire cables, each 3,700 feet long; two hoisting compartment cables 8 inches by ½ inch; pump compartment cable 6 inches by ½ inch. Average load hoisted, including cage, 15,800 pounds. Large double-decked cages, with space for two cars on each floor, weighing 5,000 pounds; weight of four cars, 900 pounds each, 3,600 pounds; weight of four car loads, 1,800 pounds each, 7,200 pounds. Without meuding, cables lasted 3 years. Height of sheaves to centers, 55 feet; diameter, 15, 12 and 7 feet.

Combination Shaft (Chollar, Hale & Norcross, Potosi and Savage).—Flat steel wire cables, 6 inches by ½ inch. Average load, including cage, 5,500 pounds. Average duration, 14 months. Height of sheaves, 50 feet; diameter 18 feet.

Consolidated Virginia and California Joint Shaft.—Flat steel wire cables; two in hoisting compartments, 7 inches by ½ inch; one in pump compartment, 5½ inches by ½ inch. Average load, including cage, 12,400 pounds. Three-decker cages, weighing 4,000 pounds; three cars, 1,200 pounds each, 3,600 pounds; three car loads, 1,600 pounds each, 4,800 pounds.

Average duration, 18 months. Height of sheaves, 45 feet; diameter of hoisting-compartment sheaves, 11 feet; diameter of pump-compartment sheave, 6 feet.

Hale & Norcross.—Flat steel wire cables, 5 inches by ½ inch. Average load in vertical shaft, including cage, 3,000 pounds; in incline, including giraffe, 5,500 pounds. Height of sheaves, 36 feet; diameter, 8 feet. Incline cable lasts only 6 months.

Ophir.—Two flat steel wire cables, 5 inches by ½ inch, in vertical shaft; round steel wire cable in incline, tapering from 2½ inches to 2 inches. Average load, including cage, 8,600 pounds. Weight of double-decked cages, 3,000 pounds; two cars, 1,200 pounds each, 2,400 pounds; two car loads, 1,600 pounds each, 3,200 pounds. Average duration with repairs, 2 years. Height of sheaves, 30 feet; diameter, 7 feet.

Oshiston Shaft (Best & Belcher and Gould & Curry Joint Shaft).—Two flat steel wire cables, each 2,500 feet long, 5 inches by ½ inch. Average load, including cage, 7,000 pounds. Average duration with repairs, 4 years. Height of sheaves, 30 feet; diameter, 6 feet.

Savage.—Two flat steel wire cables in vertical shaft, each 1,500 feet long, 5½ inches by ½ inch. Round steel wire incline cable, 4,000 feet long, 2½ inches diameter. Average load in vertical shaft, including cage, 3,600 pounds; in incline, including giraffe, 5,000 pounds. Average duration with repairs, 3 years. Height of sheaves, 40 feet; diameter, 6, 8 and 15 feet.

Union Shaft (Mexican, Sierra Nevada and Union Consolidated joint shaft).—Flat steel wire cables; two in hoisting compartments, 7 inches by ½ inch; one in pump compartment, 5½ inches by ½ inch. Average load hoisted, 13,500 pounds, including three-decker cage, 4,500 pounds; three cars, 1,200 pounds each, 3,600 pounds; three car loads, 1,800 pounds each, 5,400 pounds. When hauling, hoist 1,000-gallon iron tank weighing, shell and water, 9,812 pounds. Average duration with repairs, 4 years. Splices are from 75 to 100 feet long. "Cables wear most rapidly at points over sheaves corresponding to distances of stations; the wear is also more rapid when there is an over and under head on reel and sheave." Height of sheaves to center, 45 feet; diameter, 12 feet.

Utah.—Flat steel wire cables; vertical-shaft cables, 4 inches by ½ inch; incline, 6 inches by ½ inch. Average load in vertical shaft, including cage, 3,500 pounds; in incline, including giraffe, 9,000 pounds. Average duration with repairs—vertical shaft, 5 years; in incline, about 2 years. Height of sheaves, 25 feet; diameter, 6 and 8 feet.

On a Better Basis.

When the Cœur d'Alene excitement broke out a few years since, a great many men went to Idaho in hopes of making fortunes, and a very large proportion were disappointed. The inclement winters, the depth of the "diggings," the expense of living and the necessity of capital to properly work the mines, were not properly considered. It was no "poor man's camp," and thousands left the country disgusted. Since then, however, the region has been well prospected, ditches have been built, capital invested in many ways, and now the mines are beginning to be prosperous. It is estimated by those who have visited the region that upwards of a million dollars will be expended there by the several enterprises under way. The weather still retards hydraulic operations, and none of the gravel prospectors are at work yet, though all are getting ready.

The quartz mines of Cœur d'Alene are attracting more and more attention. A ten-stamp mill has been running for a year near Murray, where there are several quartz enterprises. At the mine of the Idaho Company, of Louisville, they are putting up a 20-stamp mill, built by the Union Iron Works, of this city. The Golden King Company, also of Louisville, Ky., are putting up another 20-stamp mill. The New York company, which expended \$75,000 last year on a bed-rock flume, have re-organized and started up operations this month. Murray, the principal town, has 1200 inhabitants, and the whole region, which many people thought would be a failure, is likely to be prosperous for a long time.

The Helena Concentrating Company, recently incorporated, contemplate the erection of works for concentrating, milling and smelting ores in Shoshone county, Idaho. The erection of works will be at once commenced at Kentucky, a small town about 28 miles from Murray, the center of the Cœur d'Alene mining region, and ten miles from the head of navigation on Cœur d'Alene river. The first of June next will see the works in operation, with a daily capacity of fifty tons. The site for the works is well chosen, as the country on all sides is rich in quartz mines, whose product can be brought to Kentucky by easy and practicable routes. The place is also easy of access

from the outside world by a route from Rathdrum, on the Northern Pacific Railroad, involving 20 miles of staging and 60 miles of steamboating up the Cœur d'Alene lake and river. Thus the works will be so situated that they will lay tributary to the wealthy mines of the Cœur d'Alene country, and command an easy and always practicable outlet for the hullion and concentrates they produce. The new company has already secured a contract from J. F. Wardner & Co. for concentrating 50,000 tons of ore from the Cœur d'Alene mines—a work that will keep their plant busy for two years after its completion. Moreover, the representatives of smelting works at Butte have contracted with several miners on the South Fork for all the ore they can furnish up to 50,000 tons. Four thousand tons are sacked at dumps, and 135 tons are at Kingston. Upon this quantity \$7,000 was advanced. The ore is carried 16 miles to Old Mission, 60 miles by steamer on lake and river, and 11 miles from the lake to Rathdrum. A contract has been made with the steamboat, and Major Manning has examined into the matter with a view of contracting for the transportation between the lake and Rathdrum. The price paid for ore at the mines is \$10 per ton; estimated cost of transportation to Rathdrum is \$27 per ton. From these statements it will be seen that the Cœur d'Alene mines are as likely to be important for quartz as for placers, and that there is a great future for the camp.

Foundry Notes.

Quick Work on Pumping Machinery.

A large mining pump was shipped to the Alaska mine, Sierra county, on Thursday, by the Dow Steam Pump Works. The contract was made last week and it was agreed to have the pump completed in eight days, though from 30 to 60 is the usual time required for such a job. The pump is of special size, and at the time the contract was made there were no drawings even. The drawings were made, patterns made, and castings and machine work finished so that the pump was finished and tested, and shipped on the eighth day. The men worked night and day to complete the job as it was a case of urgency, the water having drowned out the other pumps at the mine.

The new pump is a vertical-working shaft pump, to be suspended in the shaft. It weighs 5500 pounds, and the capacity is 600 gallons per minute. The type is well known, but this size was large and there were no patterns ready for it. The steam cylinder is 16 inches, buckets 14 inches, plunger 10 inches, and stroke 24 inches. The pump is fitted with the improved suction condenser, which improves the economy of the pump and at the same time does away with the nuisance of the exhaust in the shaft.

The pump will go in the shaft, where there are several others, which have not been able to cope with the water. The Alaska is a very wet mine, and it is said a stream of 90 inches has at present to be contended with. When the shaft is once dry again, larger station pumps will probably be put in.

This style of sinking pump is getting to be quite popular and numbers are being made of smaller size than the one just built. The Dow Works are now building one for I. E. James, to go to Southern California. Mr. Dow is making an effort to get the works in such a shape that he can at any time turn out pumping machinery at very short notice, and this is an instance of what can be done in an emergency. Oftentimes very short notice is given and people often huy from Eastern builders in order to get their work quickly, and occasionally get things not specially adapted for their wants. The pumping plants made here for mining work have been devised with special adaptations to the needs on this coast, and are very efficient. This new pump is not a stationary one, but is made to go in a small shaft so as to be readily lowered and handled. The Dow Pump Works already make more of a variety of pumps than Eastern manufacturers, and others are to be added.

Work is being resumed on a number of mines in Columbus district, Candelaria, that have been shut down for a number of years.

The Trinity county placer miners are clearing up after having a good season's run, and Weaverly is lively in consequence.

Legendary Lore of the Pueblo Indians.

Existence of a Secret Order.

As the aborigines of this continent gradually decrease in number, and the advance of civilization drives them from their homes, the ethnologist increases his efforts to preserve their histories and traditions and the records of their manners and customs. The tribes which have inherited the lands of the western coast of North America have left on the rocks their picture writings and carved records, many of which are now undecipherable. Others, again, are susceptible of translation, and much interest is taken in the meaning of these records. A short time since we gave an article on "Pre-historic Printing," in which was shown one of the pictured rocks in Nevada. The perusal of that article reminded Mr. James H. Crossman, of this city, of almost forgotten notes which he has had in his possession for some years. Colonel W. T. Robinson (who resided for a number of years with the Moquis and Zunis, in Northeastern Arizona) furnished the data to Mr. Crossman for the following notes:

The colonel acquired their language and learned much of their traditional lore, which the father of a family invariably imparts to the eldest male born child to be retransmitted. The Moquis and Zunis have undoubtedly the same origin, though distinct in tribal relations and seldom intermarrying. They differ from the ordinary North American Indian in being larger and lighter colored. They are semi-civilized; are agricultural and pastoral, house dwellers and live in communities. Their government is administered by two departments—Church and State—each independent of the other. The head man, or "big chief," is the temporal adviser and ruler. The "medicine man" attends to their spiritual requirements, and is believed to be all powerful with the deities (gods) of the spirit land. They believe in good spirits and bad, the latter predominating and being the most feared. They claim that the country from whence they originated was the cradle of the earth, and their hieroglyphic writing as interpreted by them refers to other lands beyond the "big waters" (the ocean) as the home of their ancestors. They with their families embarked on "big rafts" (ships or sailing vessels). Violent storms were encountered, driving them from their course, and they landed in a strange country and met savage men and strange animals, many of mammoth proportions. The country was covered with vegetation. They settled on these lands, and in time became a numerous and prosperous people. But their more warlike neighbors, the aborigines of the country, became envious of their success, made war on them, and conquered and drove them southward and away from their homes.

Lieut. Cushing, in the employ of the U. S. Government, also resided with these Indians quite a while, and has minutely described in his report their habits, manners and customs, and much else relating to these interesting

people. He thinks that they are undoubtedly the degenerated remnants of a prehistoric civilization. The lieutenant, however, though a close observer and a student, was evidently not *en rapport* with the tribal "medicine man." He was not a member of their secret organization, a species of Masonry, as he wholly omitted or failed in getting the following bit of legendary lore, which was gleaned by Col. Robinson, from time to time, during his long sojourn with these people:

They have a secret Order, using passwords, signs and grips, in many respects resembling the Masonic. This Order consists of 12 degrees. The symbolic emblems of the several

water," that scientists would be glad to know. The colonel stated that it required great powers of endurance and a determined will to successfully pass the ordeal, in taking these dogroes as the least sign of fear or flinching on the part of the candidate, disgraced him in the eyes of the brethren, and was a bar to his passing for the period of 12 moons (months), when he could again be proposed. The colonel also stated that the grips, signs, fire signals and passwords were also recognized by other Indian tribes that he passed through, proving that the Order, like the Masonic, with our race has branches or lodges probably extending to all the Indian tribes on the North American conti-

turn to the sun, her former home, and left her children in care of a bear of the feminine persuasion, who raised them. The Indian method of recording this is shown in numbers 4, 18, 12, 17 and 19.

The hieroglyphic chart also represents the more modern history of these people: their wanderings from place to place since their expulsion from their first settlement on the North American continent to their present abode, and is probably, though rudely drawn, a true pictorial history of incidents that have occurred.

The zigzag lines (Fig. 1) represent their flight over and across the mountain ranges from north to south, halting and settling at a point near the river Puorco, and known as the petrified forests of Arizona (See Fig. 2.) From here their legends state that they were driven by a flood, covering and inundating the whole country, causing great loss of life. The remnant of the tribe migrated northerly to the Canyon De Shalely (see Fig. 3), where they formed a settlement, and again were prosperous and happy for a long term of years, when suddenly and without warning the whole country was shaken and disturbed by violent earthquakes and volcanic eruptions, covering the face of the country far and near with hot ashes and molten lava, rendering it unfit to support animal life. They fled with terror to Wallapai (see Fig. 5) and a portion of the tribes to the mesas (Fig. 13), where they have lived for some 500 years, or 200 years previous to the advent of the Jesuit Fathers, which occurred 300 years ago (see Fig. 15). The advance guard of this religious sect consisted of five missionaries. The result was the introduction of a new order of things, such as strange gods to worship, a church surmounted by a cross, etc. The tolling of a bell was for the first time heard calling them to their devotional exercises. This state of affairs continued for a period of seven years, when the natives rebelled at the innovation. They refused to bear the Christian yoke longer, and threw the spiritual fathers, the Jesuits, over the cliffs. The cross and bell is all

ROCK CARVINGS SHOWING RECORDS OF PUEBLO INDIANS.

degrees are illustrated in the hieroglyphic chart annexed (see Figs. 6, 7, 8, 9, 10, 11, 12, 14, 16, 17, 18, 20), which was faithfully copied by Col. Robinson, from figures cut large and deep in a sandstone cliff in the celebrated petrified forests of Northeastern Arizona. The colonel during his stay became a member of the Order and learned their secrets, which he dares not impart, for death is the penalty for divulging them. The colonel took all the degrees of this Order but one, the "Sun God," which is the highest and last, where is kept the most sacred secrets of the tribe. Previous to being admitted to the Sun God degree it is necessary for the candidate to pass many years of probation, and is seldom admitted under the age of 50. It will be noticed that the number of the degrees compare with the months in the year and the signs of the Zodiac, and it is possible that this Order, with its arbitrary and mythical signs, may possess secrets of their former home beyond "the big

nent. The wild turkey and bear are deified and sacred animals. They never kill or eat them. These Indians believe that as soon as a squaw dies the spirit enters the body of a newly hatched turkey—"squaw turkey" or "turkey squaw" (see Fig. 16).

Fig. 4 also illustrates the history and birthplace and origin of man on earth. The legend teaches that:

A goddess from the sun in her wanderings visited the earth, which was inhabited only by animals and birds. The turkey was dispatched to summon its inhabitants to meet and welcome the feminine deity. She coquetted with each in turn, but finally became enamoured with the badger, and dispatched the remainder of the animals to gather food and kill game for the marriage feast. They were married, and in due time she gave birth to three children, representing three races of men—white, copper-colored and black. Having accomplished her object in peopling the earth, she decided to re-

turn to the sun, her former home, and left her children in care of a bear of the feminine persuasion, who raised them.

The following is the key to the hieroglyphic chart:

- 1.—Represents the zigzag road taken by the Zunis and Moquis crossing the mountain ranges fleeing from their pursuers.
- 2.—Their 2d settlement at the Petrified Forests.
- 3.—Canyon De Shalely: their 3d settlement.
- 4.—Birthplace or cradle of man (Garden of Eden).
- 5.—Wallapai: their 4th settlement.
- 6.—Rain God (Ajen, a secret order), 1st degree.
- 7.—Snake God, 2d degree.
- 8.—Coyote God, 3d degree.
- 9.—Snow God, 4th degree.
- 10.—Snake God, 5th degree.
- 11.—Badger God (father of man), 6th degree.
- 12.—Bear God (foster father of man), 7th degree.
- 13.—Mesa, present home of the Moquis.
- 14.—War God, 8th degree.
- 15.—Advent of Jesuit Fathers.
- 16.—Turkey Squaw, 9th degree.
- 17.—Sun God, 12th and last degree.
- 18.—The Goddess from the Sun, mother of man, 11th degree.
- 19.—The three children of the Goddess or first inhabitants on earth.
- 20.—Peace God, 10th degree.

HELENA capitalists are about to erect smelting works at Murray, Idaho.

PRACTICAL HYDRAULICS.*

Ex. 106.—In a trapezoidal canal (bottom-slope of bank), the angle of slope of bank is 45° , the depth 4.394 feet, the fall per mile $F=7.92$ feet, and the coefficient for roughness of bed $n=.017$ (see Table 26). What is the velocity and what the discharge of water per second?

Cal.—Find in Table 28, under trapezoid, with bank slope of 45° , in depth column, 4.394 feet, the given depth; opposite which, in area column, is found 46.606 square feet, and in hydraulic mean depth column, 2.5.

Turning to Table 27, find in hydraulic mean depth column 2.5, opposite which, in velocity column for

the given fall, $F=7.92$ feet, is found the velocity sought, viz:

$v=6.26$ feet.

Then $q=46.606 \times 6.26=291.75$ cubic feet.—Ans.
Ex. 107.—In a trapezoidal canal, in which the bottom is equal a side, and the ratio of the depth to the base of bank is as 2:1, the depth of water is 2.591 feet, the fall per mile $F=10.56$ feet ($n=.002$) and the coefficient for roughness of bed, $n=.025$ (see Table 26). What, per second, is the velocity and what the discharge?

velocity column for the given fall $F=10.56$ is found the velocity sought, viz:

$v=2.943$ feet.

Then $q=10.86 \times 2.943=31.96$ cubic feet.—Ans.

Ex. 108.—In a trapezoidal canal, in which the bottom is equal to a side, and the ratio of depth to the base of the bank is as 1:2, the depth of water is 5.543 feet, the fall per mile 1.056 feet, and the coefficient for the roughness of the bed, $n=.035$. (See Table 26). What is the velocity, and what the discharge per second?

Cal.—Find in Table 28, under trapezoid 1 on 2, in depth column the given depth 5.543 feet; opposite which in area column is found 130.04 square feet, and hydraulic mean depth column 3.5. Turning now to Table 27, find in hydraulic mean depth column 3.5; opposite which in velocity column for the given fall $F=1.056$, will be found the velocity sought, viz:

$v=1.392$ feet.

Then $q=130.04 \times 1.392=181.02$ cubic feet.—Ans.
Ex. 109.—The diameter of a semi-circular canal being 8 feet, the fall per mile 26.4 feet, and the coefficient for roughness of bed $n=.012$, (see Table 26). What is the velocity per second and what the discharge?

Cal.—Find in Table 28, under semi-circle, in diameter column 8 feet, the given diameter; opposite which in area column is found 25.133 square feet, and in hydraulic mean depth column, 2.

Turning now to Table 27, find in hydraulic mean depth column 2; opposite which in velocity column for the given fall, $F=26.4$ feet, is found the velocity sought, viz:

$v=14.22$ feet.

Then $q=25.133 \times 14.22=357.39$ cubic feet.—Ans.
Remark.—It will be observed that Table 27, is equally well adapted to finding the flow of water in circular pipes as in semi-circular canals. For the hydraulic mean depth is the same in each. Thus in Example 108, were it required to determine the velocity of water in a circular pipe running full, the only change required in the calculation would be to double the area, whence would occur a corresponding change in the result, as follows:

$357.39 \times 2=714.78$ cubic feet.

In case of foul pipes it will be better to employ Table 27, rather than Table 17, computed for clean iron pipes, the coefficient of roughness for whose walls as shown is $n=.011$.

Ex. 110.—The observed data of a canal are as follows:

Width of bottom, 15 feet.

Depth of water, 4.5 feet.

Ratio of depth to base, 2:5.

Fall per mile, 3.168 feet.

Coefficient of roughness of bed .017.

What is the velocity of flow per second, and what the discharge?

</

ENGINEERING NOTES.

Electric Locomotion.

Electric locomotion is evidently regarded abroad with much more interest and attention than has ever been given to it in this country, and promises alone, with a conspicuous lack of practical development, seem there to be the exception rather than the rule. English and German engineers have furnished unmistakable proof of the capabilities of electric systems of propulsion. In view of the progress there effected, the lack of spirit, and perhaps also of merit, in connection with such electric enterprises here appears somewhat remarkable. Evidently there is a serious hitch in electric locomotive engineering in this country, and a successful remedy, which does not seem to be very difficult to find, must be applied to re-awaken public confidence.

We condense the above from an American contemporary, and while admitting the general truthfulness of the comment upon American enterprise in this direction we take pleasure in publishing the following paragraph from the *Electrical Review* in regard to what appears to be a successful inauguration of

An Electric Cable Railroad in Denver.

The first successful attempt at trial trips of the new cable car was made this week in Denver, Colorado, over a portion of the track of the Denver Electric and Cable Railroad Company, on Fifteenth street. The car ran a considerable distance, and at the satisfactory rate of eight miles an hour. A dynamo 20 horse-power furnishes the motive power for the car. Quite a large number of prominent citizens took rides on the car. Prof. S. H. Short, of the Denver University, has worked very hard to make his invention a success, and his efforts seem to be already reaping their reward. The company have hoped to get their cars running in six weeks or a month. The car which is now being used in making trial trips is shaped (and fitted up very much like an ordinary street car, and is fully as handsome in its style and appointments as any street car in Denver. It was made by Woehler Brothers, of Denver. The dynamo and other machinery, which is located in a building near the corner of fifteenth and Tremont streets, and which is used to propel the car, was made by F. M. Davis, of Denver, and all the plant and material used by the company will be of Denver manufacture. Ex-Governor John Evans, W. N. Byers, Rodney Curtis, and other well-known Denver gentlemen, are among the officers and directors of the new company. Some further trips will be made by the car, and large numbers of people will undoubtedly visit Fifteenth street, just below the court-house and between Tremont and Glenarm streets, and inspect the invention and its workings for themselves.

A MAGNIFICENT SEWAGE PROJECT.—An enormous scheme for the disposal of the sewage of London has been projected by Colonel Jones and Mr. Bailey Denton. Canvey Island, in the Thames, not far from its mouth, is a low, flat island of 4500 acres area, which, although containing a few dwellings and a church, lies below the level of high tides, and the water is kept from overflowing it by embankments 10 to 12 feet high. To this island the proposition is to convey the sewage of the metropolis, and after purifying it by lime, which can be procured at small expense from the chalk which crops out on both sides of the river near by, discharge the effluent in the river on the falling tide, the low-water level being 10 to 12 feet below the surface of the island. The solid portion of the sewage will be deposited on the surface and render the soil fertile and productive. If found profitable to do so, the liquid portion of the sewage might be pumped on to the main land over a ridge 200 feet high and 5 miles off, and thence flow by gravity over a territory of 60,000 to 80,000 acres of arable land.—*San. Eng.*

GREAT ENGINEERING IMPROVEMENTS are being effected in Venezuela. The work of building a breakwater at Laguyra on the coast, a few miles from Caracas, is to be commenced at once. The entire breakwater will cost \$40,000,000. Blocks of concrete, weighing 500 tons each, will be laid in the sea. No money will be taken from the public treasury. The London company agrees to accept a certain sum per package for all merchandise going over the breakwater for 99 years.

A VERY skillful piece of engineering in a water tunnel at Riverside, San Bernardino county, came to a finish last week, when the two forces of hands working in from each end of the tunnel met. The tunnel is over 3,000 feet in length, and part of it is a curve, yet so true were the calculations made, that when they met in the center there was not one-fourth of an inch difference in the two divisions.

A CAR SEAT recorder has been invented by Mr. Bywaters, of Paris, Texas, which, located in the middle of the car seat, is so connected by gearing with the car axle that when depressed by the weight of a passenger it will record the number of miles traveled by the vehicle while the seat is so occupied.

LIQUID FUEL is attracting much attention in Europe. The Russian Black Sea Navigation Company is building a large fleet of tank steamers to import petroleum in bulk.

USEFUL INFORMATION.

Use of Sandpaper.

In handling this subject, we expect to tread on the toes of both bosses and workmen. Still, we think a few suggestions will not be amiss. Sandpaper occupies a very important position; and, as it is more frequently used, and in greater quantities, than almost any other single article, it becomes a serious question as to cost. The workmen, if so disposed, can materially reduce or increase the cost by using the paper up thoroughly or only using it half. We have seen some throw the piece away if only the edge was off the paper; others would use the edges and corners and the center is good; and others, again, the center, and leave the corners good. That is a waste. As the paper is given to use, it is immaterial what shape you use it in, so that it has answered its purpose. It does no good to pile it up, or stow it away in a box to be used again; except in a very few cases, it never gets used again, and only accumulates for nothing. We generally use ours up until there is no virtue left in it, and then throw it away, either into the fire or into the waste box.

Now, we know there are some bosses, who never seem satisfied unless they see a box or refuse paper around, and insist that we must use it, because it is to them like getting double service out of it. So they do, but at what a cost? Sandpaper, as bought by them, stands in the neighborhood of about one-half cent per sheet. Divide that into, say eight parts, which makes the cost about one-sixteenth of a cent per part. It is used until the cutting edge is off, and then thrown to one side. It has done all that can be expected from one-sixteenth of a cent. Now, to use it again will require at least two-thirds more time than at first. Say a man is getting 20 cents an hour; he can use the eighth part of a sheet up in about from 5 to 10 minutes, according to the condition of the job he is doing. Give him 10 minutes, and he has done, say one-half of a large panel. Now make him do the other half with the same piece of paper, and I think I would not be far wrong when I place the time at half an hour, even if he could do it at all, which I doubt. The question is, which is the more valuable—the paper or the man's time? In the first instance, the man occupies one-third of the half hour at a cost of 3½ cents in time, and one-sixteenth cent in paper. To cover the same amount of surface with the same piece of paper again would bring the cost of the time occupied on the second half to 10 cents, from which might be deducted one thirty-second of a cent for the use of the old paper. In other words, trying to save one-sixteenth of a cent, we have actually lost 20 minutes in time, and 6½ cents in money—enough to buy over 13 sheets of new paper. As I said before, we use our paper as long as there is any virtue in it, and no longer. We turn and cut it up so as to get all there is of service in it, and then cast it away.—*Carriage Monthly.*

WHAT CAN BE DONE ON A BICYCLE.—A Hartford (Conn.) paper gives the following report of the performances of an expert on the bicycle: He showed some wonderful things that may be done with a bicycle. Before he got through with his exhibition no one would have been surprised if he had thrown aside the wheel and ridden around on the air where it had been. His best feats were: Riding with small wheel off the ground; hacking with small wheel off ground; swinging in small circle on the big wheel only; facing backward and riding forward; standing up on saddle; sitting on saddle, the machine being still and balanced; machine upside down, mount the big wheel, turn the small one over into place, and start off; removing the small wheel, ride the large one backward or forward; lay handle bars on the ground, mount big wheel, reach over and get the handle, and start off. He succeeded on the third trial and was cheered. Then he removed the handle bar, leaving only the big wheel, which he rode. Next he removed the treadle from the big wheel, and, mounting, propelled it with his hands. Next he stood upright, hands in air, and rode the wheel. Then he brought out a common wagon wheel, placed his feet on the hub on either side and propelled it with his hands. He closed by laying the wheel flat on the ground, suddenly pulling it upright, springing on and riding away. This was loudly applauded.

A PRAIRIE FIRE EXTINGUISHER, which might also be advantageously used in cases of fires in California wheat fields, has recently been patented by A. W. Ramsey, of New Kiowa, Kansas. It has a water tank and heaters, so arranged that when propelled over the lines of a fire it will heat out and extinguish the flames at each side, and ram a swath or belt around haystacks, buildings or fields for protection against approaching fires.

ZINC PAINT.—In the preparation of paint with oxide of zinc instead of white lead, the practice in Germany is to replace the ordinary boiled linseed oil in the mixing operation with one made by gently boiling 200 pounds of raw oil for five or six hours, then adding about 24 pounds of coarsely broken lumps of binoxide of manganese, and continuing the boiling operation for about 10 hours longer. In this manner a very quickly drying linseed oil is obtained,

which is specially adapted for this purpose of being used with zinc white and other zinc colors. Much depends upon the use of old linseed oil, and also upon the pains taken with the boiled oil, which, unless carefully kept from contact with the air, becomes thick in a very short time. The boiled oil so prepared is not to be used in painting with zinc white, but is mixed with from three to five of raw linseed oil of the best quality, while the paint is being mixed together or compounded.

In December last the *Atlas* mentioned a proposition of redwood manufacturers to make extensive shipments of lumber to Eastern cities, if suitable rates could be obtained from the railroads. The parties interested presented the matter to the Transcontinental Association at their meeting in this city, but no conclusion was reached during the session. The disruption of the association and the subsequent war which has sent rates rattling down grades presented excellent opportunities for the large manufacturers to introduce redwood into Chicago and other Eastern markets. They were not slow in taking advantage of low freight, and an immediate movement of considerable lumber has taken place. Messrs. Moore and Smith shipped forty carloads from Stockton to Eastern cities at one time. Mr. Smith has gone East to make arrangements for further consignments, and the indications for a heavy movement are exceedingly favorable, providing reasonably low rates continue. An association of heavy manufacturers has been formed here for the purpose of making large exports of this valuable class of lumber.

WELDING WITH BAD COAL.—The best welding when bad coal must be used, says the *Scientific American*, may be made by pulverizing 10 parts horax and 1 part sal-ammoniac together; then heat the mixture until the water boils off and the mass is dry, and pulverize and use for welding in the same way as with horax powder. A better way (if you cannot get coke) is to make your own coke, for welding use only, by taking from the forge fire, a little at a time, the coked or half burnt coal and quenching it by sprinkling with a little water; lay this aside for special use.

A PLASTIC COMPOUND to be used in the manufacture of burial caskets, furniture, etc., has been patented by Mr. Thomas Law, of Moulton, Iowa. It consists of resin, black lead, sulphur, and rubber, melted and mixed together in stated proportions, that will readily mold and harden to make a waterproof and imperishable compound, and will also form an excellent cement.

GOOD HEALTH.

Killed by Swallowing Silk.

Mrs. John T. Green, residing at No. 479 Ninth street, died Friday of last week, and it was thought her death was caused by a tumor in the stomach. She had complained of excruciating pain in the side and there was considerable swelling. A post-mortem examination conducted by several physicians revealed one of the most singular cases known to medical science. What was thought to be a tumor proved to be a large roll of silk and mohair fibers which had gathered in the stomach in such a way that the passage to the intestines was obstructed. Several years ago Mrs. Green—then Miss Mary Kinney—was employed in a silk factory in New Jersey. It is said that she had a habit of biting off the ends of silk thread and chewing them. In this way it is thought she swallowed small pieces of the thread, which gradually settled at the outlet of the stomach and with mohair which she swallowed—Mrs. Green being apparently a monomaniac on the subject of eating threads, etc.—formed the ball found by the physicians. "It is a most wonderful case," said a physician this morning. "I never heard of anything like it before."—*Troy, N. Y., Times.*

[Balls of hair are frequently found in the stomach of cattle, formed there by the collecting together into a mass of the hair derived from the animal licking itself. Hair will not digest in either the human stomach or in that of dumb animals, and it would appear from the above that silk is also indigestible.]—*EDS. PRESS.*

EXTRACTING TEETH WITH THE PISTOL.—Old Dr. Monsey extracted teeth by fastening a strong piece of catgut securely to the tooth, to the opposite end of which he affixed a bullet. With this bullet and a full measure of powder, a pistol was charged, and when the trigger was pulled, the operation was performed effectually and speedily. Once a gentleman who had agreed to try the novelty, and had even allowed the apparatus to be adjusted, at the last moment exclaimed, "Stop, stop, I've changed my mind!" "But I haven't, and you're a fool and a coward for your pains," answered the doctor, pulling the trigger. In another instant the tooth was extracted, much to the timid patient's delight and astonishment.

OYSTER POISONING.—Complaints in regard to poisoning from eating oysters are not of infrequent occurrence. Quite a little sensation has recently been created in Bombay from this cause. There have recently occurred in that city several cases of death from oyster poison-

ing, death in some instances occurring on the morning following the fatal repast. Until the last few years, it is stated, the Bombay oyster was as harmless as the oyster of Kurrachee is now, and it certainly ought to be possible to explain the reason for the extraordinary change.

Influence of Hot Drinks on Digestion.

Various opinions are held by the public, and we believe by medical men also, on the effect of hot drinks on the digestion of food. This matter has lately been investigated by Dr. V. E. Nyesel, of St. Petersburg. The plan he adopted was to make use of 20 patients in the surgical wards of the Ohukhoff hospital, suffering from fracture of the fibula, contusion of the foot, and such like affections, and dividing them into two sets of ten each, to find out first, by a three days' experiment, the length of time an ordinary meal of soup, meat, potatoes and black bread required for digestion. For this purpose the stomach tube was employed at periods varying from five to seven hours and a half after the meal, and the condition of the contents of the stomach examined. In all the cases complete breaking down appeared to have taken place in about six hours and a half. The exact time required by each individual for the digestion of the specified meal being noted, further observations were made on a subsequent day, the patients in the first group being given after the meal hot tea, at a temperature of from 40 to 60 degs. C., the quantity taken varying from two to eight tumblerfuls. The contents of the stomach were drawn off at the time when, as former experiments had shown, digestion would, under ordinary conditions, have been complete. The result was that, when not more than three tumblerfuls of hot tea had been swallowed, it was found that digestion had progressed just as well as without it, but a larger quantity of hot tea appeared distinctly to retard the digestive process. The second group of patients were given a meal similar to what they had had before, but hot. On examining the contents of their stomachs, no difference could be detected between the rate of digestion of hot and cold food. The author found that by painting the pharynx with a five-per-cent solution of hydrochlorate of cocaine the tube passed easily and quickly.—*Lancet.*

DAMP BEDS.—The *Lancet*, referring to the death of Mr. Maas, the well-known tenor, calls attention to the peril of sleeping in a damp bed. As a matter of fact, this peril is of the greatest, and it is almost ever-present. The experienced traveler rarely hazards the risk of sleeping between sheets, which are nearly sure to be damp, until they have been aired under his personal supervision at a fire in his bed-room. If this be impracticable he wraps his rug around him, or pulls out the sheets and sleeps between the blankets—a disagreeable but often prudent expedient. The direct mischief may result from the contact of an imperfectly heated body with sheets which retain moisture. The body heat is not sufficient to raise the temperatures of the sheets to a safe point, and the result must be disastrous in the extreme if, as is sure to happen, the skin be cooled by contact with a surface colder than itself and steadily abstracting heat all this night through.

There is no excuse for this neglect of proper precaution to insure dry beds. Servants are never to be trusted in this matter, and the managers of hotels, even of the best description, are singularly careless in respect to it.

CATS AS BEDFELLOWS.—Cats are never good bedfellows for children, and especially not for infants. It is a common belief that they will suck the breath of a sleeping infant. Dr. Tomlinson disposes of this question as follows: "What good do you suppose it would do to a cat to draw into its lungs breath which a human being has just exhaled?" Nevertheless, it may be said, with all respect for Dr. Tomlinson and no respect at all for superstition, that the warmth-loving cat has a way of preferring baby's crib as a sleeping place to any other bed or corner. If driven away she will return stealthily again and again to the snug covert. She loves, furthermore, to nestle close to baby's body, as often as not thrusting her whiskered nose against the velvet cheek, pink and warm with sleep. Thus far, she may do no harm, but when she occasionally curls her bulk of five, six or eight pounds' weight upon the sleeper's heaving chest mischief may come of it. To escape the risk of this mischance, if for no other reason, keep pussy away from your snoring baby. Indeed, he is best off without any bedfellow.

POISONED BY COCAINE.—A case of poisoning from the application of cocaine was recently reported to a medical society in New York. The question was fully discussed, Dr. Holcomb saying he had heard that a fatal case of cocaine poisoning had occurred in one of the city hospitals within two or three days. It would be of value to hear from Dr. Douglas the result of his experience in applying, nearly every day for several months a spray of cocaine to General Grant's throat. He was convinced that this drug was one that required great care in handling, and that druggists should label it "poison." Other physicians corroborated these views.

IRON IN MEDICINE.—Tinctures of iron so largely used in medicine, consists of a solution of chloride of iron 35 parts, with 65 parts of alcohol.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Alameda.

PROSPECTING.—Never before has there been so much activity in the mining industry in this valley, as at present. One company is boring for oil, another is reopening our coal mines, a solid firm is stimulating our new chrome mines, and private capitalists have purchased a manganese deposit. Best of all, each of these operations is backed by capital, and is being pushed ahead without delay. Our mountains are being prospected, too, as they never were before, and we are confident that other valuable mines will be discovered during the coming summer. Gold has been found from time to time in various localities, in small quantities for twenty years, and specimens of both gold and silver ore have been brought in during the past week. What would be of most value now, would be a rich chrome or manganese mine convenient to our town.

HAVE STRUCK OIL.—The workmen of the Livermore oil company struck the first oil rock several weeks ago, and have since been boring through the several strata, with the view of tapping the main stream, or deposit, from which the oil which oozes to the surface is supposed to come. There was first some gas, and then a little oil, and this week quite a stream of oil was encountered. It does not flow but is pumped to the surface. The company will keep on drilling, and Mr. Gutman states that the oil already struck will be used to run the engine instead of wood. It is expected that in or below the lower layers of this oil rock a large stream will be found, with a pressure sufficient to give a flowing well.

Amador.

MISCELLANEOUS.—The big tunnel at Middle Bar has reached underneath the Mammoth works with no developments of importance. A few small stringers of quartz have been met with, and it is probable that by following these rich deposits, gold-bearing metal will be met with as in the upper works. The cannon ball quartz mill at Murphy's Ridge has been moved to the Wetzlar mine, a short distance south of the ridge. The Zeile hoisting works are in good working order again and the shaft is being fixed as rapidly as possible. The mill is not running to its full capacity and not likely to until the shaft is repaired. It is reported to-day that a number of men have been laid off at the Zeile. The job of fixing the shaft will take some time to complete—how long it is still impossible to say. W. F. Detert, the superintendent, started for San Francisco this morning.

LAI D OFF.—Amador *Dispatch*, April 3: Quite a number of miners at the Zeile mine have been laid off for a while on account of a bad cave in the mine, which has interfered with the work of getting out rock enough to keep the mill running for a while. It will probably be several weeks before the mine will be in good working shape again.

THE KENNEDY.—Several heavy castings for the new hoisting works at the Kennedy mine, including a new "skip" weighing 1,000 pounds, were brought up last Wednesday.

Calaveras.

CLEANUP.—*Mt. Echo*, March 31: A cleanup was made at the Stickle mine in this place during the week, the result of which was about \$8000. James Tullac & Son are building an arastra on their mine on the grade between Altaville and Murphys. Mr. David Hunt of this town, has taken charge of the Collier mine situated about six miles southeast of Murphys. A small force of men have already been set at work. A big cleanup was made at the Lane mine in this place last Monday. Twenty-one pounds of pure gold being the net yield of a two week's run. Immensely rich rock has just been struck, and an unprecedented yield is looked for at the next cleanup. A cleanup of the arastra at the Maltman mine in this place, yielded between 25 and 30 ounces of amalgam, which, when retorted will amount to about \$7 per ounce. This yield is the result of a 14 days run. We are informed that the celebrated Gold Cliff mine in this place will start up during the coming month. The Gold Cliff is a valuable mining property, and as soon as it starts, it will be the means of giving employment to a large number of men.

WEST POINT.—*Cor. Calaveras Chronicle*, April 3: Mining is being quite extensively prosecuted in this vicinity, and with some very favorable results. The mine owned by Mr. Keltz is paying a good dividend and it is thought it will be a permanent mine. Messrs. Roe & Jenkins have struck a real bonanza. The Water Lily has suspended operations for the present. The Scorpion mine is still being worked under the management of Mr. Quinn.

Fresno.

ACTIVE.—*Fresno Exporter*, March 30: The mines present an active appearance at present. The season has become settled and work has commenced in earnest. From thirty to fifty and sixty men find employment at present. The Quartz Mountain mine started up again Saturday working forty-five men. These mines have had to contend with the scarcity of water heretofore, but they will fear no scarcity this year. The unusually rainy weather has given them a plentiful supply. Their unfinished and costly canal will not be needed. The mill crushing the quartz is in constant operation at present and the noise made by the stamps can be heard rumbling down the mountain sides miles below. The beautiful house built for the president of the company is unoccupied at present, the president being in France. One of the grandest views in the mountains is obtained from this house. This palatial residence, built at the cost of \$40,000, stands on the top of the mountain, and below on all sides is one of the grandest views in these grand mountains. From the back is seen the lively mining camp and beyond the noisy mill, stretching beyond are vast valleys, beautiful with their spring carpet of grass and flowers.

Inyo.

YGNACIO MINE.—*Inyo Independent*, April 3: For months past Mr. George T. Hawley has had, and still has, a force of men at work prospecting the Ygnacio mine, at Cerro Gordo. The mine is now

so far developed as to put beyond question the fact that it is a valuable property. The Ygnacio will soon be making a valuable addition to the bullion output of Inyo county. About fourteen men are now employed at the mine.

FROM LEAD TO GOLD.—For some time past two miners, Reynolds and Treglow, have been working a lead and silver bearing claim just south of the Eclipse. A few days ago the lead vein pinched out, but just under it the men struck a gold vein that is quite rich. An incline has been put down over twenty feet on the new find and it holds of the same character as far as yet seen. Stopping has been begun and a lot of the ore will be taken out for milling.

HOPE MINE.—The Hope might now with safety be called the Certainty. During the past week the mine has shown up a ledge that is a big thing. Mr. Harris was up at the mine last Wednesday; he says there is seventy feet of backs in the finest looking body of ore he has ever seen in the county. The vein is about four feet wide, and from twelve to thirteen inches of this runs away up in gold. The strike is setting others to work at Chrysopolis. It is reported that a branch railroad will be built from Hawthorne to the Lapanta mine. The length of the branch will be about twelve miles. The building of this piece of road would do much to promote the development of the country in the neighborhood of the Lapanta mine; it is already proven that there is a very promising field there for mining.

MINES BONDED.—*Inyo Reporter*, April 3: A Mr. Radovich, of San Francisco, the reputed purchaser of the Silver Peak property, a short time since, has recently bonded a number of mines out at Lida Valley, and the prospects are that a sale will be consummated.

Mariposa.

RED CLOUD MINE.—*Mariposa Gazette*, April 3: The Red Cloud quartz mine and the ten-stamp, steam power quartz crushing mill, belonging to an incorporated company of that name in San Jose, is situated on Beans creek, ten miles north-easterly from Coulterville. The mill for some time past has been running upon good ore averaging \$30 per ton. The lower level, which is 360 feet below the surface, shows two distinct chimneys near 100 feet apart. The last chimney, which was struck a short time back, was exceedingly rich, and if there had ever been any lack of confidence in the mine, or had about petered out, it was then fully restored, and with a four foot vein in the slope of considerable distance, probably to the surface, evidently gave rise to the value of the mine. The management is under Mr. J. S. Carter, the president of the company, who employs 16 men. About ten tons of ore is crushed every twenty-four hours, which, if the rock pays \$30 a ton (\$720 a day), it must be considered a financial success to its owners. Mr. Daniel Knight the mill-wright, has been engaged in building and repairing at the mill for the last two or three months. He speaks very highly of the mine and thinks it one of the best he has ever come in contact with in the county. The prospect of the Red Cloud mine is very flattering at present, and judging from the great body of ore in sight, it will be a source of profit to its stockholders for a long time to come.

Nevada.

THE YUBA MINE.—*Nevada Transcript*, March 30: George E. Webber, principal owner of the Yuba quartz mine of Washington township, was in town last night on his way back to San Francisco. Mr. Webber has discontinued the mine in this State and is re-incorporating in New York State where he recently disposed of a portion of the stock. The New York parties who invested with him express a desire to purchase the balance of the stock held by him, but the bargain has not yet been closed. Mr. Webber owns another valuable quartz property in the same locality, and should he sell out his entire interest in the Yuba he will at once take steps to open the new claim on an extensive scale.

WILL SOON START UP.—*Foothill Tidings*, April 3: The old Kentucky mine will soon begin work. This mine is situated northeast of the Idaho, and joins the Alpha ground. Being in such a good location, it is a wonder that the mine has lain idle so many years. It has been about 12 years since the works closed down, and at that time it cost so much to keep the mine dry, and to hoist the ore, that it would not pay. Now that water power can easily be obtained and the mine worked at a comparatively small expense, the owners have determined to resume operations, feeling confident that they can make a paying mine of the Kentucky.

RICH ORE STRIKE.—Saturday afternoon the Phoenix mine ran into some exceedingly rich ore, in the slope above the bottom level. A blast was put in and the ledge opened up its treasure chamber bright with pure gold. From a very little place about three candle boxes full of specimens were taken, aggregating about \$600 or \$800. The ledge here is from ten inches to one foot in thickness.

QUARTZ.—*North San Juan Times*, Apr. 3: A very rich quartz vein or lode has been struck on Buckeye Hill, below Sweetland. It is over 40 feet in width, and bids fair to become one of the best quartz mines in the State. The vein runs under Mrs. Sneath's vineyard. It is owned by A. N. Crane and others of this place. The walls are slate.

Placer.

POCKET.—*Placer Republican*, March 31: Judson Wheeler came down from Bath yesterday. Mr. Wheeler says that the recent strike in the Breece & Wheeler proved to be only a pocket of pay gravel and did not last long. They are now opening up new ground and are working on what is supposed to be the same channel the Hazard mine is on.

Plumas.

THE VALENTINE.—*Plumas National*, March 29: This mine is situated at Mohawk. The owners have made a short run which paid about \$75 dollars per ton, and a large amount of the same kind of rock in sight. Messrs. Stephan and Sutton, two of the lucky owners, are in San Francisco negotiating a sale of the property. The ledge is about 20 feet wide and prospects regularly from wall to wall.

THE BUCKEYE.—J. G. Berg, of the La Porte stage, informs us that the Buckeye still looks well as ever, and that Sawpit will have a boom this summer equal to the Haley on days of 1863-4. Ed. Clifford says that in the leading mine of Bell district is the biggest ledge of base ore he ever saw.

San Benito.

GOLD.—*Hollister Advance*, Apr. 2: Gold has at

last been discovered in San Benito county. At least so some people say. L. Miller and H. B. Hinshaw have staked out a claim on the ranch of Henderson Brown, at Brown's Valley, and are actively engaged delving for the shining metal. Samples of ore have been shipped to San Francisco for assay.

San Bernardino.

CALICO DISTRICT.—*Calico Print*, April 4: That Calico is one of the best chloriding camps, if not the best, on the Pacific Coast, is an established fact. A large share of the mining done here is of that nature. It has often been styled the "poorman's camp," and the name is appropriate, because scores of men without means have realized handsome stakes from leases on various mines where the ore is easily extracted, and some have made independent fortunes. There are few who undertake chloriding that do not at least pay expenses, and the number who make more than ordinary wages is considerable. This mode of mining is becoming quite popular as it is a more independent way of making a living, while the prospect of striking rich pockets or deposits of ore makes operations exciting and interesting. The character of the rock in this region is such as to render mining comparatively easy, it not being necessary to timber, no water being found to cause trouble. The rates of milling are gradually becoming lower so that ore that had to be left on the dumps because it could not be milled at a profit to the chlorider can now be taken to the mill by him and realize a fair profit. Leaching works have recently been started in the suburbs of Calico and have proved a success on a small scale, the proprietors being able to make a handsome profit out of ore ranging from \$12 to \$20 per ton. There are millions of tons of low grade ore that can be reduced by the leaching process if carried on extensively. Here is a splendid opportunity for the profitable investment of capital. The camp now is on a permanent foundation, and the prospects of mining being successfully carried on for many years are evident on every hand. The mines are self-sustaining, while progress is constant, while business in every department, properly managed, yields profits ranging from good wages to independent fortunes. E. Elliott & Son have a lease on a portion of the Inevincible and are running a cut so as to get at the ore that is in sight easier. Paul Prisk also has a lease on a portion of the Inevincible and is running a cut. He has a little ore in sight. In addition to the above Eckles & Co. are stopping and drifting on the claim, and take out about two tons of rock per day, and ship about 20 tons per month to Barber's mill. The profits probably range from \$18 to \$30 a day. A rich strike was made in the Kearsage the other day at a depth of about 70 feet. An eight-inch vein was uncovered which has widened to 18 inches. The ore taken from this place is very rich. This mine has proved one of profit to the various companies of chloriders and the owners of the property. The Pinto, owned by Myers & Anderson is looking well. A tunnel has been driven in about 200, which will connect with the main tunnel of the Little V, now in progress. The chloriders on the Comet are taking out considerable ore, some of which gives a high per cent of copper. The work of drifting on the ledge is progressing. Two teams are daily employed hauling ore from the Sam Houston No. 3, leased by McBride and Miller, to the Barber mill.

San Diego.

THE PINACATE MINES.—*Los Angeles Express*, Apr. 3: A. A. Saunders is in from the Pinacate mines, and reports times lively in that district. He has been out there for nearly a year, and has a claim which yields rock that goes \$1248 per ton in gold. Other claims in that vicinity show as well. Mr. Saunders will return in a few days to continue the work of taking out ore.

Shasta.

QUARTZ.—*Shasta Democrat*, March 31: Wm. York, of Vallejo, has been up on Flat creek for several days past testing the Red Rock mine with a view of purchasing. Prospectors are finding some good gold and silver ore on the south fork of Dog creek, and several locations have been made during the past ten days. W. P. Miller, M. E., was up on Squaw creek a few days past looking at mining property in the interest of mining capitalists. He has a high opinion of the district. The Mammoth mine in Old Diggings district was sold last week to Messrs. Shattuck & Shearer for \$20,000. Part cash was paid down, the remainder to be paid in six and twelve months. Whit George last week struck a fine prospect on Clear creek adjoining Senator Jones' mine. The vein appears to be about ten feet wide, the surface ore of which prospects big in free gold. Hart & Day, who purchased the Fleming mine in Old Diggings district last fall, have incorporated under the name of the Georgia and Texas Milling Company, with Mr. Hart as superintendent. The company is preparing to add five more stamps to its mill. Last Monday our old friend and prospector, John Finley, showed us several fine specimens of free gold ore from a ledge he and Peter Cowan located a few days ago. The "find" is situated about a mile southwest of the Buckeye Ranch, Lower Springs district. They have sunk ten feet on the vein and already have taken out several tons of very rich rock. Our reporter visited Squaw creek last Saturday and Sunday and found the camp livelier than ever. The Croesus company is rushing its mill to completion with all possible haste, and expects to have it running inside of twenty days. Carson & Snyder have their tunnel completed a distance of 120 feet, which gives them over 100 feet of stopping. Their mine shows up well and is attracting much attention. Frank Davis, of the Clipper mine, is driving his tunnel ahead rapidly, which is now in a very rich body of ore. The boys are now figuring on putting up a mill, as they have sufficient high-grade ore in sight to warrant the investment. Fred Meyers last Monday delivered the last load of machinery for Reilly & Mathews. This company expects to have its mill running in 30 days.

Sierra.

ALASKA SHUT DOWN.—*North San Juan Times*, Apr. 3: The Alaska is again shut down and is rapidly filling with water. The large pump used in freeing the mine from water became disabled several days ago, and while working upon the pump the water was kept at a standstill by drawing it off in tanks. After some time the cable, to which the tanks were attached, broke, letting one of them into the sink. This put a stop to everything until a new pump can be put in. When it is remembered that this mine runs a stream of 90 inches of water con-

tinually, it will be seen what an immense amount of damage an accident like this implies.

GOOD HOPE.—*Mt. Messenger*, April 3: H. H. Purdy, manager of the Good Hope mine, has put in a water-blast to furnish the men in the tunnel with air. The rock is of such a character as to require blasting.

Trinity.

PLACERS.—*Shasta Co. Democrat*, March 31: The Trinity county placer miners are clearing up after having a good season's run, and Weaverville is lively in consequence.

WILL GO TO NEW RIVER.—*Humboldt Standard*, March 30: We find many citizens of Eureka who are still enthusiastic in the belief that fortunes await them as the result of well-applied and untiring labor in the New River section. There are a good many people in Eureka who will go there before the close of spring. Those here who have interests in New River are equally sanguine, and will commence work with renewed ardor this year. The cost of prospecting and opening of mines cannot be so great as they were when the first discoveries were made in Nevada, Bodie, or many other sections which could be instanced. There is no telling what this year's developments at New River will result in.

MORE STAMPS.—Mr. Henry Martin, Superintendent of the Brown Bear Mining Company's works at Deadwood in this county, was in town this week. He has just returned from a business trip to Marysville, where he went to order five additional stamps for the Brown Bear Mill. The new battery will arrive and be set to work as speedily as possible, making fifteen stamps in all at work on the rock from that mine and leased ground. The Brown Bear is proving a bonanza and no mistake.

RICH ROCK.—We learn that Van Matre & Ramm who have a portion of the Monte Cristo mine at Deadwood leased, have struck another bunch of very rich ore. A sample of two ounces was tried the other day and yielded \$1.37. Good enough.

WEAVERVILLE never was much duller than it is at present. Miners at work and all hands hoping for more lively times in the sweet bye-and-bye.

Tuolumne.

RICH ROCK.—*Tuolumne Independent*, April 3: A strike was made last week in the Simonich claim, at Brown's Flat. Some very rich rock was found, but how extensive the chute may be has not yet been determined.

NEVADA.

Washoe District.

HALE AND NONGROSS.—*Enterprise*, April 3: Since the connection has been completed with the 2900 level by the winze or upraise from the 3000 the air circulation thus established has been just what was desired, and as soon as the upraise can be properly finished up it is proposed to stoop from it into the merits of the good ore vein it has been passing through. Drifting north is resumed in the face of the main north lateral drift on the 2900 level toward the Savage line in low grade ore, to show up what exists in that direction in the shape of richer and better ore. The ore body being developed in the upraising above the 3100 level is showing up finely and improving. This ore runs high in gold as well as being heavily charged with black sulphates of silver. There is plenty of the ore, but the richest it lies in bunches and streaks amid quantities of low grade ore. It is, however, fully demonstrated that good-paying ore can and does exist at these great depths. And the richest ore being found in bunches is a very favorable indication of the possibility that a large bunch or concentration may be encountered at almost any time. The quality, also, of the ore at this lowest point—between the 3100 and 3000 levels—is better than found above, being of a purer, more kindly and fertile character.

CON. CALIFORNIA AND VIRGINIA.—The regular daily yield continues to be a little over 400 tons per day, two-thirds of which comes from the lower levels and the rest from the old upper workings, the general average of all the ore worked at the Morgan and Eureka mills being about \$17 per ton. On the 1650 level the new crosscut west, No. 1, is making good progress toward the old ore stoops.

GOULD AND CURRY.—The main southwest drift on the 600 level has been cleared out, retimbered and put in complete order throughout, and is now being advanced in new ground, the direction being turned to the east of south. The face is now about 160 feet from the Savage north line and in quartz and vein porphyry. The crosscut west recently started from the main southwest lateral drift about 220 feet north of the Savage line is in 52 feet, all the way in strongly mineralized quartz.

OPHIR.—The south lateral drift from the main west drift, from the old Mexican shaft, on the 300 level, is in 76 feet. Material in face, vein porphyry and low grade ore. On the 400 level the north lateral drift on the 360 feet. Material, same as above. The rock chute leading down to the 500 level has been repaired and put in complete order.

CHOLLAR.—Supt. Hamilton has returned from San Francisco, but it was deemed advisable by the directors of the company, as well as the superintendent, not to resume sinking the Combination shaft just yet, or until the south lateral drift, in Potosi ground on the 3100 level, has been run through to the Bullion mine. Crosscutting in Chollar is talked of, but will not be indulged in at present.

ALTA.—The main north lateral drift on the 700 level has about reached the Benton south line. The material encountered has been principally dry vein porphyry, with occasional bunches and streaks of low-grade ore. The main ore vein lies to the westward and will be made the subject of crosscutting explorations hereafter.

MEXICAN.—On the 500 level west crosscut No. 2, from the main north lateral drift, is in 125 feet. Face in vein porphyry. On the 700 level the Joint Union and Mexican drift, running northwest from the Ophir shaft, is in 583 feet; material, vein porphyry, with occasional streaks and bunches of quartz.

POTOSI.—Excellent progress continues to be made in advancing the main south lateral drift on the 3100 level, it being now 225 feet from the Chollar north line. The ground is dry and favorable, the drift following rather to the southeast along the west side or footwall of the ore vein.

BEST AND BELCHER.—Since the donkey pumps started up last Tuesday the water in the Osbliston

shaft has been lowered 24 feet, and it still continues to recede in a satisfactory manner, draining the ground as it goes.

CROWN POINT AND BELCHER.—The daily yield is increased to 400 tons, the Vivian mill now also running on ore from these mines. The lower levels, as well as the old slopes of the upper workings, are turning out finely.

SIERRA NEVADA.—The crosscut west on the 520 level is in 297 feet, 29 feet having been added during the week. The material is very hard, dry porphyry and quartzite, allowing of no rapid advancement.

YELLOW JACKET.—Daily yield 130 tons from the old workings above the 1300 level. A good force of men are kept at work exploring and opening up new ore resources on the various levels.

MONTE CRISTO.—Running the drifts west from the new shaft on the 50 and 150 levels in hard rock. No ore being extracted from the mine at present.

KENTUCKY.—About 45 tons per day continue to be the daily output of ore from the mine, which is reduced at the Rock Point mill.

UNION CONSOLIDATED.—North lateral drift No. 2 on the 500 level is in 336 feet. Advancing in vein porphyry.

Bradshaw District.

THE OUTLOOK PROMISING.—*Silver State*, Mar. 29: Charles Day and Robert Fugit, two experienced and enterprising miners, are quietly developing mining claims in Bradshaw district, which give promise of being valuable mines. The district is situated in the range west of Winnemucca mountain, about 22 miles north of west from Winnemucca, and embraces a part of what was formerly known as Silver State district. The formation is a soft variety of granite, capped with slate, though some of the principal veins have granite hanging and foot-walls. Two of the leads, owned by Messrs. Day & Fugit, are prospected to some extent. One, the Silver State, has an incline 135 feet deep on the lead. In seeking this incline, several hundred tons of ore, which is estimated to contain \$50 per ton besides a smaller quantity of richer ore, was extracted. Of the latter quality, 9000 pounds was brought here yesterday by Elias Jones' team, for shipment to Salt Lake. This ore averages about \$300 per ton, and resembles that produced by the Ohio company's mine at Rebel creek. The other lead, which is named Beck, in honor of the Kentucky senator who so ably advocated the cause of silver, is prospected by a shaft to a depth of 65 feet. The ledge is from five to six feet wide, and will average about \$40 per ton. The ore is of the sulphuret variety, and by the concentration process of reduction ten or twelve tons can be reduced to one worth from \$400 to \$500. There is an excellent opportunity for some person to build concentrating works in the district, with the assurance of having plenty of ore to keep them running steadily.

Bristol District.

DOING WELL.—*Pioche Record*, March 29: Chas. Roe writes in from Bristol that since the completion of the roaster at the mill he is doing well, having taken out sulphides worth \$10 a pound. Would it not be policy for the Bullionvillians to take a trip out to Bristol and try to pick up a point or two that might aid them.

Columbus District.

THE MILL.—*Cor. Inyo Register*, Apr. 1: Finishing touches at the mill comprise a retort house and assay office. A platform has been built from the ore receiving room to the bank in the rear of the mill. They are also building an ore chute 100 feet long, and are completing a water-tank with a capacity of 20,000 gallons. Col. Sunderland is now en route to London with the view of getting the English company to purchase some of our mines. It is the only way to utilize the mill; otherwise it is a dead letter.

Eureka District.

ORE.—The Dunderberg mine on Prospect mountain continues its shipments of ore in good shape. Thirty-four and a half tons were sent down to the Eureka Con. works during the past week. From the Enterprise mine, Prospect mountain, six tons of ore were shipped to the Eureka Con. works day before yesterday. Ten tons of ore were shipped from the Frazier and Molino mine on Adams Hill to the Richmond reduction works on Wednesday last. Some six or eight lots of ore are at the Richmond furnaces awaiting sampling, which work cannot be done for a day or two owing to repairs being made.

Globe District.

GOLD MINE.—*Belmont Courier*, March 29: Work is being pushed in the new gold mine in Globe district. It is confidently expected by those interested that the next mining excitement will be in this district.

Gold Mt. District.

SUSPENDED.—*Belmont Courier*, March 29: Work has been suspended in the mines and mill at Gold Mountain. The cost of working was greater than the value of gold produced—hence the result.

Hawthorn District.

A GOOD CLEANUP.—*Walker Lake Bulletin*, Mar. 31: The Cat creek mill made another cleanup on Saturday from a run on Pamlico ore. This lot of ore averaged \$100 and has put the Pamlico on a solid footing among the paying mines. It has now within six months of the date of location been put into working shape, and enough money has been taken out while developing was progressing to pay all expenses and leave a margin for dividend.

Jefferson District.

MILL.—*Belmont Courier*, March 29: The Harrison Brothers will soon start up their little mill at Jefferson.

Mineral Hill District.

QUIET.—*Cor. Eureka Sentinel*, Mar. 29: Mining matters with us may be said to be quiet. Just at present but little is being done in the way of prospecting. In fact, there is too much snow to admit of much surface work. A few men have been kept in the company's mines all winter, and are breaking some very good ore. The pans are running at the mill on slickens, but the battery may not be put to crushing for a month or more yet. The Lost mine, south of town, has been worked most of the winter, but just at present is lying idle for some unexplained reason. This property is owned principally in Eureka, and has produced considerable good ore. The Hecla mine, also the

Lucky have yielded some very rich rock this winter, although not in large quantities.

Park Canyon District.

TO BE RESUMED.—*Belmont Courier*, March 29: Operations will be resumed in the Giant mill, Park canyon, about the first of April. Everything being in tip-top running order, big shipments of sulphides to Salt Lake will be in order.

Pennsylvania District.

MILL RUNNING.—*Pioche Record*, March 29: The mill at Pennsylvania district is running first class. The retort is about completed. The men have been put to work extracting ore.

Pioche District.

CHLORIDERS.—*Pioche Record*, March 29: On Monday the chloriders at the Bullionville mine, to satisfy themselves as to the grade of ore they were extracting, shipped a small batch of ore into town, and it sampled 243 ounces silver per ton. This result satisfied the boys that they were extracting pay "filth."

Spanish Belt District.

ORE.—*Belmont Courier*, March 29: Some very fine ore is being extracted from the Barcelona mine at Spanish Belt. It will be shipped to Eureka for reduction.

Tuscarora District.

GRAND PRIZE.—*Times-Review*, April 3: North drift on the 200 extended 28 feet. The slopes above the 200 are producing some very good ore at present. Everything of value is being removed from the 400 level, as the water is now in the level.

Union District.

CHLORIDERS.—*Belmont Courier*, March 29: Some few chloriders are at work in Union mining district.

Washington District.

BASE ORE.—*Belmont Courier*, March 29: Capitalists will some day take hold of the mines of Washington district, which have lain idle so long. As soon as silver reaches anywhere near par these locations will be profitably worked. The deposits of base ore there are said to be immense.

ARIZONA.

ORE.—*Mohave Miner*, March 29: A carload of ore from the Golden Queen mine, Arrowhead district, San Bernardino county, was recently worked at the Kingman Sampling Works, which returned \$91 per ton in gold. It is currently reported that the Providence Mining Company and other mining capitalists will erect immense smelting works at the Needles in the near future. If this be so Mohave county will become the banner mining county of the west. The Kingman Sampling Works recently worked 10 tons of silver ore from the Jim Blaine mine in Five Points district, San Bernardino county, which realized \$240 in silver, \$18 in gold and 41 per cent lead. The net amount obtained from this shipment above all expenses was a little over \$2,500. Messrs. Wright and Layne made a shipment yesterday from the Prosperity mine, Todd Basin. Mr. Dana has five men at work on the Franklin mine at Stockton Hill, and has struck a fine body of very high-grade galena ore. Tom Burke made a shipment of five tons of rich ore from the I. X. L. mine last week. J. H. Johnson is making a good thing out of the C. O. D. mine. He sent another carload to Kingman last week. Two Duncan concentrators have been received at the Cerbat mill, and as soon as they can be placed in position the mill will start up, so Supt. Barry informs us. W. H. Sherman has just shipped a carload of lead ore from the Champion mine.

TOMBSTONE.—*Democrat*, March 30: Since our last report the work of the camp has been steadily but surely progressing. The number of chloriders at work at present has greatly increased, and the result of this labor is generally remunerative. Were charges lower a greater number of claims could be worked, but time will, no doubt, bring this about. The pumps on the hill are still quiescent, but, with the recommencement of raising the water, the spirits of all in camp and its returning prosperity are assured facts. No better proof than those best posted have faith in the permanence and durability of the camp can be found than the fact that the Randolph and Junetta mines have lately passed into the hands of one of the most largely interested mining men here. This points to their steady development and the consequence of more men.

BISBEE.—*Tombstone Democrat*, March 31: Any person visiting this camp to-day who has not been there the last four years would certainly be struck with the many changes that have taken place. The well-known quarry where ore was first struck has yielded over 60,000 tons, and since the consolidation of the Queen and Atlanta Companies the developments under ground have been carried on with great perseverance and success, many different ore bodies having been discovered, most of which are reserved for future use. At present about 100 tons of ore daily are run through the two smelters, the average grade of which is about 8 per cent copper. In places the copper is found with manganese; this smelts better than when the iron oxide predominates and produces a higher grade of copper bullion. Thirty-five men are daily employed breaking ore whilst around the smelter, and in other parts of the mine the total of men on the pay roll is about 80.

THE LOOKOUT.—This is one of the Neptune Company's properties leased to Mr. Cloud. The success he has met with has induced him to remove the smelter formerly at Hereford to this place and it is now being erected. It is calculated that there is enough ore in sight here to run this smelter for at least six months whilst the work of development is being daily carried forward. The abnormally low price of copper has induced economy in every branch. Miners' wages now stand at \$3 per day. Copper bullion is about 5 to 5½ cents per pound as near as can be ascertained.

LEASED.—*Prescott Courier*, April 2: The Parker mine, on Groom creek, which adjoins the King Kelly on the south, was on Saturday last leased to Mr. Fink. The drift in the Kelly mine after running its full length, 125 feet, on an unbroken body of high-grade ore, entered the Parker ground last week. It will be continued into the Parker and a shaft of 100 feet will be sunk to explore the ground in both Kelly and Parker mines below the level of the drift referred to. The ore is a gold bearing sulphuret easy of concentration and will be worked in a mill which it is intended to erect on the creek in the neighborhood of the mines, Wells H. Bates,

formerly connected with the Marcus mine, has organized a New York company to work 10,000 acres of placer ground below Walnut Grove. The work contemplates an immense reservoir for the storage of water, a pipe line of 14 miles in length and an expenditure of \$250,000 to put the enterprise in working order. Prof. Blake, the well-known mining engineer, has recently been over the ground in the interests of the company and it is confidently predicted that the work will be completed by next fall. Good news keeps coming from Mr. Gray's mill and the Compton mine, Turkey creek district. Capitalists want the Gray Eagle mine, Bradshaw district, which is one of the largest and richest gold properties in this or any other Territory. Mr. Flint is in town from the headwaters of Hassayampa creek. He says but little about mines of his district, but it is a well-known fact that many of them are pretty well developed and will bear inspection. Those who ought to know tell us that Humburg district, which lies on the southern slope of the Bradshaw mountains, will, ere long, have 600 or 700 miners. The St. Louis Yavapai Co., is doing a great deal for development of the district, which has no equal in Arizona as a producer of high grade gold and silver ores. A partial clean up at the Lynx creek hydraulic diggings was made last week, when gold to the value of \$1,200 was taken from the boxes. A pan of stuff from another set of boxes, yielded \$4, and it is thought that the heavy stuff in them would run up into the thousands.

COLORADO.

NEW DISCOVERIES IN LAKE.—*Tribune-Republican*, April 3: Prospecting is being carried on at Leadville, more vigorously and extensively than in any other mining section of the State. There are many illustrations of the activity now shown in searching for new mineral bodies in old properties and in virgin territory. Cecil C. Morgan is reported to be doing well with the Agassiz, and Billy Christian has opened a bonanza in the Cleveland, where he has persistently delved for several years. Bill Loveland has either struck or salted rich ore on the north side of Big Evans gulch, while the deep, wet shafts on East Fryer and Yankee Hills are gradually proving the presence of valuable mineral chutes over a very extensive area. Nowhere in the State is prospect work being done in so intelligent and thorough a manner as at Leadville, and the result will undoubtedly be to make the Carbonate camp more famous as a producer in future years than in the past.

AS USUAL.—*Idaho Springs Gazette*, March 30: A large strike of rich ore has been made in the Argo mine, Ute creek, by the lessee. This property has remained idle a long, long time, after being purchased by a company, who elected a whim, shaft nouse and a boarding house, and then agreed to disagree. After a few years of idleness, along comes a tenderfoot from Denver who takes a lease and bond on the property, and if he don't take the purchase money out of the mine he will come very near it. Then a dozen old-time miners, who always know it all, will stop cutting the grocery counter and in one breath say they knew it was that.

IDAHO.

NOTES.—*Ketchum Keystone*, March 29: The Minnie Moore, Idahoan and North Star will be the heaviest producers in the county this year. Since January first, 1886, the Idahoan mine has yielded 26 car-loads of first-class ore, averaging 13 tons per car, and paid out about \$7,000 for machinery, besides 30,000 in dividends. A new mining district, to be known as Arco Mining district, has just been organized, with Arthur Judges Recorder. This new district is bounded on the north by a line dividing Custer and Alturas counties, on the east by Houston mining district, on the south by Snake River lava beds, and on the west by the Lava Creek and Antelope mining districts. The Florence claim, located just below the Baltimore mine in 1883 by S. R. Millon and Joe Nibbler, is just coming to the front and promises to be an ore producing property. Mr. Millon and his partner took in a third party, Dr. A. C. Lewis, and commenced work on the claim in February, running a short cross-cut and then sinking, and have gone down thirty feet on the ledge and found eighteen inches of quartz, carrying iron pyrites and black sulphurets. The vein is uniform and will probably assay over 100 ounces per ton. The surface rock was honey-comb iron oxide.

STRIKE IN THE QUAKER CITY.—Just as we go to press news comes to town that six inches of that rich ore peculiar to the Quaker city has been struck in that mine. Prof. Jenney is quite jubilant over the strike.

MONTANA.

LA PLATA.—*Miner*, Mar. 27: The Silver Bell shipped twenty-nine tons of ore yesterday. About 400 tons of ore is piled up at Sheridan Junction awaiting transportation. Eight thousand dollars' worth of ore is piled up on the dump of the Gray Eagle. The Genesee ships 125 tons per month, but has temporarily suspended shipments for repairs on the mine. Duggan & Co., who have the lease on the old workings of the National Belle, have struck a good sized pocket of \$60 ore. Manager Harvey of the Silver Bell has contracted with Fraser & Chalmers of Chicago, for a \$12,000 Cornish pump. It will be a daisy. Two shifts are working on the tunnel to cut the Treasure Trove. Two hundred feet remain to be run, and on its completion will prove up one of the biggest ore bodies in that section. The tunnel now being run to cut the Lone Star is in 160 feet with fifteen feet to go. As the rock is very hard it will take about two weeks to reach the ore body. The Copper King is outputting four tons per day. The mine is in excellent condition. Twelve men are working the Black Lightning, one of the best properties in Pongheepsie gulch. The crosscut has reached the vein, and a large body of high grade ore was cut. There are about fifty tons of ore on the dump. Messrs. Woods, Hovey & Robbins will begin work on the Last Chance, a newly located Red Mountain property in the vicinity of the Charter Oak. A shaft of twenty feet is on the claim and a four inch streak of iron and galena is showing. The shipments of ore for the past week were forty-four carloads, making 351 cars or about 3,500 tons to date. As the cars in some instances fall short of ten tons

each, it is impossible to give the same statement in tons; and as some cars have a capacity of twenty tons, ten tons per car is not below the average.

THE OLD PENOBSCOT.—*Helena Independent*: The once celebrated Penobscot mine is indissolubly connected with the history of Helena and might be said to be the mine which first drew attention to Montana as a mineral territory of fabulous possibilities. It was located about ten years ago by three miners who sunk two shafts on it, and who sold their prospect to Nate Vestal in '76. After realizing a fortune Vestal sold the mine to Eastern capitalists for \$400,000 cash. After working it profitably for several years the rich ore gave out, and the company slunk down for good. Last summer John Longmaid bought the property for \$4000, and has since been working on Penobscot ore which the former owners considered worthless. Last week Mr. Longmaid made a rich strike by sinking a shaft in a part of the Penobscot that had not been touched before. A depth of twenty feet developed a vein of a foot to two feet wide of free gold quartz of wonderful richness, stated to be exactly similar to the old Penobscot. Specimens brought in will assay way up in the thousands.

NEW MEXICO.

SHIPMENTS.—*Silver City Enterprise*, March 30: Caples and Sweetland, who have a lease on the Willis and Martin mine, in Hanover gulch, are now making regular shipments from their mine to Socorro. Their ore averages from 30 to 40 per cent lead, and from 6 to 10 ounces in silver, and some of their ore has assayed as high as \$1700 in gold. The ore has attracted the attention of the Billing people at Socorro, who sent a man out last week to take a look at the property. More prospecting and developing is now being done at Hanover than for years past. Old-time Pinos Altos is fast forging to the front as a producer.

SILVER.—*Silver City Enterprise*, April 2: The silver bricks were shipped from Georgetown this week. The Mimbre mill at Georgetown is running on regular time. An extension has been given to the bond on the Alaska mine, in Cow Springs district, until the sixth day of this month, at which time parties who were represented by Mr. Degnan will be on with the money to take the property.

OREGON.

PLACER AND QUARTZ.—*Jacksonville Times*, Apr. 2: Quartz is being hauled steadily to the mill here, which is kept busily at work. The showers of the past week have a tendency to keep up the water supply somewhat. Prospecting continues everywhere and excellent prospects are reported in many places. Wm. Wade, who is mining near Grant's Pass, picked up a nugget worth \$50 in his claim not long since. Messrs. Craft and Witt are prospecting some placer mines in the Blackwell district, with excellent results. The placer miners have well nigh given up all hopes of a spring run, and most of them are cleaning up. Prospecting continues unabated in the Blackwell and Gold Hill districts, where some fine quartz ledges exist. A quartz nugget, containing about \$20 in gold, was picked up in Dean & Co.'s diggings in the Willow Springs district recently. R. J. Orme informs us that considerable prospecting is being done in the Foothills Creek district and that some good ore has been struck. B. A. Knott, of Blackwell district, has discovered a promising quartz ledge, and is building an arastra with which to work the ore. A rich strike has been made in Granville, Sears & Co.'s quartz ledge about four miles from Jacksonville, and considerable excitement has been raised in consequence of it. Brown & Co. intend adding more improved machinery to their quartz mill in this place, and a machinist from Portland is here seeing what is wanted. There is no better mill in the State than this one. Placer miners in Josephine county are also complaining that the water supply is getting light, and many of them are preparing to wind up the season's work. A better run than for several years past has been had and good results may be expected. C. H. Burton, of Grave creek, writes us that the miners are busy cleaning up, and that water holds out well. He says there will be more gold taken out there this spring than for four or five years past. They never had a better run of water. A correspondent of the *Times* writes from Evans creek: Boyd & Johnson are again making Woodville headquarters. They are interested in four ledges that run \$10 and over. Some of the best ore runs \$400. Mr. Wilcox has struck an extensive gravel deposit one mile back from Evans creek that prospects well. The Carter Bros. were in on Saturday and disposed of \$125 worth of dust from their claim on Saxe's creek. Hannum & Co. on upper Grave creek are still pipping. There are several other good paying claims in that locality.

UTAH.

THE CHRISTY CO.—*Southern Utah Times*, March 29: The crosscut, run from the bottom of the winze below the 250-foot level in the Stormy King, tapped the upper vein this week so that stoping can now be operated on both veins.

THE STORMONT CO.—An average of 37 tons of ore was shipped from the mines to the mill last week. The slopes in the Thompson are looking favorable, and at present are furnishing considerable good ore. A crosscut was started this week on the fifth level south in the Buckeye and Savage towards the hanging after reaching which winze No. 30 will be sunk to the 600-foot level. The ledge, at this point, is 30 feet in width, and as the country above it has produced a large quantity of ore, some good stoping ground will probably be opened up.

THAT NEW STRIKE.—The Virgin City strike was a humbug, conceived by an impecunious chlorider who realized a sack of flour and a slab of sowbely out of the excitement. Most of the rock failed to show a trace of silver.

OTHER NOTES.—Indications are that the lessees of the Honest Miner, on the White Reef, will develop a paying mine. The boys are working in five feet of fair grade ore in the incline. Bob Lund returned from El Dorado, with favorable reports of the Canyon mines. The Lucky Jim, owned by Reefers and operated by Jim Cronin, is showing up well. Two shafts 100 feet each, show the ore body from top to bottom. The rock runs from 400 to 700 ounces silver, and \$30 gold.

Gardner Spring Governor.

GARDNER GOVERNOR COMPANY,

J. S. Mundy's Patent Friction Hoisting Engines.

The Mundy Patent has been sustained in the United States District Court of New York against the Ledgerwood Manufacturing Company, and also in the District Court in the State of New Jersey against Kendall & Roberts for infringement. Therefore all parties are cautioned against making, using, or selling Friction Drums that infringe this patent.

Gardner Governor.

GORDON & MAXWELL COMP'Y MINING PUMPS.

THE MOST EXTENSIVE PUMPING MACHINE WORKS IN THE UNITED STATES.

MORRIS COUNTY MACHINE and IRON CO. New High-Speed AIR COMPRESSOR.

We have recently furnished the contractors the machinery for La Trinidad (300 tons per day) and Silver Queen (100 tons per day). These mines are located in Mexico and belong to La Trinidad Company, of London. The Process is the Wet Concentration, and the Plants are, without doubt, the most substantial and complete of the kind ever built.

WE MANUFACTURE ENGINES, BOILERS, AND SAW-MILL MACHINERY, and Carry in Stock :

Wood and Iron Working Machinery, Best Belting, Lubricants for Cylinders and General Machinery, Including the Celebrated ALBANY LUBRICATING COMPOUND.

SEND FOR CIRCULAR.

IMPORTANT TO GOLD MINERS! SILVER-PLATED AMALGAMATING PLATES FOR SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.

Warranted the Best Made, Durable and Satisfactory. Full weight of silver and best quality of plating guaranteed.

BEST SOFT LAKE SUPERIOR COPPER USED.

3000 Orders filled. References first class. Prices the very lowest. Have received every Medal awarded on the Pacific Coast for Mining Plates. Old Mining Plates Bought, Replated, or Gold Separated.

SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS, 653 & 655 Mission St., San Francisco.

E. G. DENNISTON, Proprietor.

These Plates can also be procured of JOHN TAYLOR & CO., Dealers in Assayers' and Mining Material, 112 to 118 Pine St.

NOTICE.—Mining men are cautioned against purchasing inferior quality of Silver-Plated Mining Plates now being manufactured in this city. There has been a general complaint by purchasers that these plates proved defective in plating and short in weight of silver, assays showing great deficiency in silver guaranteed. Thin, light plating looks the same as heavy, but has no durability. Good plates can be furnished at same price these poor plates cost.

Centrifugal Roller Quartz Mill.

ORE CRUSHER.

PATENT

LIFE-SAVING RESPIRATOR

Entirely Prevents Lead Poisoning
and Salivation

The most perfect appliance for people engaged in Smelting, Dry Crushing, Guano Works, Quicksilver Mines, Lead Corroding, and all other occupations where there is dust, poisonous vapor, or bad odor.

In Feeding Threshing Machines, and similar work, they are indispensable, as no foreign substances can be inhaled when they are worn.

The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, \$3.00 each or \$30.00 per dozen. Sent post-paid to any address on receipt of price.

Address communications and orders to

T. E. JEWELL, Sole Agent,
330 Pine St. (Room 4) San Francisco.

Send for Descriptive Circulars containing Testimonials of well-known parties who are at present using them.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF HYDRAULIC GIANTS, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et al.

Prices furnished upon application to

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont St., San Francisco, Cal.

HOSKINS' Patent Blow-Pipe & ASSAY FURNACES

FOR CHEMISTS, ASSAYERS, METALLURGISTS, ENGINEERS,
JEWELERS, DENTISTS, Etc.

NO DUST,
NO ASHES.
Portable,
Practical.
Automatic,
Economical.

Will do for
every thing
that a
Coal Furnace
—or—
Gas Furnace
will, and
WITHOUT A
BLOWER.

Send for price list and Descriptive Catalogue. JUSTINIAN CAIRE, 521 Market St., S. F.

This cut represents our

IMPROVED
HYDRAULIC
MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Send for Circulars and Price List. HOSKIN & CO., Marysville, Cal.

List of U. S. Patents for Pacific Coast Inventors.

From the official report of U. S. Patents in DEWEY & Co.'s Patent Office Library, 252 Market St., S. F.

- FOR WEEK ENDING MARCH 30, 1886.
- 338,699.—HARVESTER—H. A. Benton, Farmington, Cal.
- 338,821.—CAR COUPLING—I. H. Bradshaw, S. F.
- 338,823.—CABLE RAILROAD SWITCH—Brown & Stratton, S. F.
- 339,043.—HORSE UNHITCHER—A. J. Coffee, Portland, Oregon.
- 338,832.—OIL CAN—W. G. Dinsmore, Oakland, Cal.
- 338,833.—DASH-BOARD ATTACHMENT—M. Fahy, Oakland, Cal.
- 339,091.—COTTON GIN—S. D. Freeman, Fort Thomas, A. T.
- 338,842.—OIL STOVE—H. L. Howse, S. F.
- 338,755.—BRIDGE—H. Krusi, S. F.
- 339,005.—WASHING MACHINE—W. V. Lawlor, S. F.
- 338,858.—FLOUR BOLTING REEL—W. C. Meyer, Vallejo, Cal.
- 338,859.—BUOY ATTACHMENT FOR VESSELS—P. Micheletti, S. F.
- 338,868.—MIXED PAINT—Pearce & Beardsley, Oakland, Cal.
- 338,869.—GATE—E. H. Penfield, Santa Barbara, Cal.
- 338,794.—EFFLUVIA EJECTOR FOR WATER CLOSETS—Wm. Smith, S. F.
- 338,799.—WINDMILL—S. Standish, Pacheco, Cal.
- 338,885.—BALE AND BOX HOOK—P. J. Stockinger, San Jose, Cal.
- 338,887.—FIN CAN SEAMER AND JOINTER—C. M. Symonds, S. F.
- 338,905.—VEHICLE SPRING—Jas. R. Wright, Portland, Oregon.
- 16,589.—SCARE PIN DESIGN—J. A. Bidwell, Ivanpah, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Mining Share Market.

The mining share market is pretty well demoralized, sales being few and prices low. In their sworn financial statements the following mining companies report a balance on hand, April 1, 1886: Consolidated California & Virginia, \$33,814.60 in cash and \$77,312.86 the face value of market bullion. Another shipment will be received to complete March account. The indebtedness of the company embraces the expenses for the month of March, the total of which is not yet known. The expenses during the month of February were \$121,000. No dividends need be expected this month. Holmes reports a balance of \$2,092.02 in cash and \$55,373.98, face value of unsold bullion. The monthly dividend will be declared as usual. Bodie Consolidated has \$9,918.16 cash on hand and liabilities of \$1,230.48, with last month's expenses which are not yet advised. Mono has \$22,400 in cash and \$10,564.31, the assay value of bullion in transit; liabilities \$602, and the last month's expenses which are not yet advised. Alpha Consolidated reports on hand \$2,203.97, and is collecting a fifty cent assessment. Best & Belcher has \$36,588.08, or enough to run the mine several months without another assessment. Bulwer reports \$14,264.69 on hand. Utah has \$6,402.34 on hand, Ophir \$21,309.71, Hale & Norcross \$30,387.08, with \$2,908.50 additional to be received on the pending assessment. Occidental had a balance of \$1,801.27, Sierra Nevada \$14,153.86 and Gould & Curry \$3,078.54, with an assessment of 40 cents per share now being collected. Potosi has \$9,272.73 on hand, Chollar \$22,426.49 and Mexican \$15,436.25.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Barber's Mill, April 4, \$5,500; Odessa Mill, 4, \$14,500; Oro Grande Mill, 4, \$4,107; Calico Co., 4, \$11,020; Ibez, 4, \$8,500; Alice, 1, \$13,046; Hanauer, 1, \$3,780; Silver Reef District (for March), \$23,103; Hanauer, 2, \$3,210; Park City, 3, \$1,500; Hanauer, 3, \$2,743; Lead ore, 4, \$14,750; Alice, 4, \$13,262; Stormont, 4, \$3,200; Queen of the Hills, 4, \$2,900; Hanauer, 4, \$2,620. During the week ending April 3d there was shipped from Salt Lake fifteen cars bullion, 429,317 pounds; five cars copper ore, 148,850 pounds; two cars refined sulphur, 48,000 pounds.

Send for Circular.

TO PHYSICIANS.

A good Physician and Surgeon can learn of a location promising well for the future in Southern California by addressing this office.

ASSESSMENT NOTICE.

Santa Anita Mill and Mining Company.
Location of principal place of business, San Francisco, California. Location of works, Nevada county, Cal.
NOTICE is hereby given, that at a meeting of the Directors held on the 31st day of March, 1886, an assessment (No. 9) of two cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the company, room 4, 309 California Street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 27th day of April, 1886, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 17th day of May, 1886 to pay delinquent assessment, together with costs of advertising and expenses of sale.
J. M. BURNETT, Secretary.
OFFICE—Room 4, No. 309 California Street, San Francisco, California.

ASSESSMENT NOTICE.

Gould & Curry Silver Mining Co.
ASSESSMENT No. 52.
Levied.....March 27, 1886
Amount.....Forty Cents per Share
Due in office.....April 30, 1886
Sale Day.....Tuesday, May 26, 1886

ALFRED K. DURBROW, Secretary.

OFFICE—Room 69, Nevada Block, No. 309 Montgomery Street, San Francisco, Cal.

THE ROLLER ORE FEEDER

(Patented May 23, 1882.)

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar or repairs.

Golden State and Miners' Iron Works.

Sole Manufacturers,
237 First Street, San Francisco, Cal.

UNCLE Sam has found it at last! A sure remedy for Torpid Liver, Sick Headache, Habitual Constipation, Chills and Fever, and all affections of the Kidneys and Liver. This is a New Compound, and one trial will convince you that it is the Cheapest and Best Remedy in the Market for Diseases of Kidneys, Liver and Stomach. If you want a pure vegetable compound, that is positively guaranteed to contain no mercury, go to your Druggist, and get a Bottle of the 'Arkansaw' Liver and Kidney Remedy. Price, \$1.00 per Bottle.

MECHANICAL EXPERT

J. F. DALY,

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.**

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS.
(\$575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrators are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco. As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warns the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1860, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Room 7—No. 109 California Street,

SAN FRANCISCO, CAL.

\$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

**THE
"TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE, placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

THE JENKINS STANDARD PACKING

IS ACKNOWLEDGED BY USERS AS THE BEST in the world. Unlike all other Packings, the Jenkins Standard Packing can be made any thickness desired in a joint by placing two or as many thicknesses together as desired, and following up joint, it vulcanizes in place and becomes a metal of itself (it is frequently called Jenkins Metal), and will last for years, as it does not rot or burn out. Avoid all imitations, as a good article is always subject to cheap imitations. The genuine has stamped on every sheet "Jenkins Standard Packing," and is for sale by the Trade generally.

MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS,
embracing machinery of LATEST DESIGN and
MOST IMPROVED construction. We offer our cus-
tomers the BEST RESULTS OF 35 YEARS' EX-
PERIENCE in this SPECIAL LINE of work, and
are PREPARED to furnish from SAN FRAN-
CISCO or CHICAGO, the MOST APPROVED
character of MINING AND REDUCTION MA-
CHINERY, adapted to all grades of ores and su-
PERIOR to that of any other make, at the LOWEST
POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DE-
LIVER in COMPLETE RUNNING ORDER, in
any locality, MILLS, CONCENTRATION
WORKS, WATER JACKET SMELTING
FURNACES, HOISTING WORKS, PUM-
PING MACHINERY, ETC., ETC., of any DE-
SIRE CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD
ores of NEW and ORIGINAL DESIGNS, covered
by LETTERS PATENT. No other Furnace CAN
COMPARE with these for DURABILITY, and in
CAPACITY for uninterrupted work. MORE
THAN 150 of them are now RUNNING in various
parts of THIS COUNTRY, as well as many in
FOREIGN COUNTRIES, giving results NEVER
BEFORE ATTAINED as regards CONTINUOUS
running, ECONOMY of fuel, AMOUNT and QUAL-
ITY of BULLION produced. These CLAIMS have
been PROVEN BY RESULTS in ANY NUM-
BER of INSTANCES, and the GREAT SUPER-
IORITY of this SYSTEM of smelting ores DE-
MONSTRATED BEYOND QUESTION. COM-
PLETE PLANTS furnished to order of any CA-
PACITY, with ALL IMPROVEMENTS that ex-
perience has DEMONSTRATED as VALUABLE
in this class of work.

Beyond question the cheapest and
most effective machine of the kind
now in use adapted to all grades and
classes of ores.

This machine has been THOROUGHLY TESTED
for the past TWO YEARS, under a GREAT VA-
RIETY of CONDITIONS, giving most EXTRA-
ORDINARY results FAR IN ADVANCE of
anything EVER BEFORE REALIZED. A re-
cent COMPETITIVE TEST at the Carlisle Mine in
Mexico, showed an ADVANTAGE OF OVER 30
PER CENT in favor of THE DUNCAN. The
amount SAVED OVER THE TRUE being suffi-
cient to PAY THE ENTIRE COST of the ma-
chines EVERY MONTH OF THE YEAR. One
of its MOST VALUABLE features is as an AMAL-
GAMATOR. It saves all THE AMALGAM GOLD
and SILVER that ESCAPES the BATTERIES,
PANS or SETTLERS, making the machine worth
MORE than ITS COST for THIS PURPOSE
ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist-
and affording means for the continuous operation of a
Pump or Blower, without interfering with a hoisting ap-
paratus. It is made entirely of iron, no piece weighs
over 300 pounds. At the ordinary speed of a horse, a
1,000-pound bucket of ore may be raised 120 feet per
minute. The hoisting-drum is under the complete con-
trol of the man of the shaft, and is capable of carrying
500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

A New Circular Stamp Battery.

Some months ago we stated that a new stamp battery was being built in this city, and that in due time we would prepare an engraving of the new device. This we now do, and the engraving here presented is so correct an illustration of the battery that there is but little left for us to explain. The cut represents a 12-stamp battery—the medium size—they being made of three sizes, to wit: 8, 12 and 20 stamps. The points claimed for this battery are as follows:

1st. An iron battery, in every detail as to feed, tappets, stems, shoes, dies and boxes, the same as in the ordinary battery. It is simply a straight battery thrown into a circle and so constructed that the iron work is self-supporting, hence doing away with all wood-work; thus the structure rests upon its foundation more firmly than a wooden battery possibly can.

2d. The application of power is nearer the base than in an ordinary battery, consequently there is less leverage and less vibration.

3d. The foundation will not cost ordinarily over \$75.

4th. A 12-stamp mill will not require a larger building than an ordinary 5-stamp straight battery.

5th. More quartz can be crushed for power expended than by a straight battery, as there are no "end stamps" to impede work, and the discharge surface is greater.

6th. It is a good amalgamator on account of the circular motion given to the ore during reduction, as 85 to 90 per cent of the metal is retained inside of the battery.

7th. Foundation and power being ready, the mill can be erected and running in three days after it is delivered on the ground, thus saving in working time enough to pay the cost of a mill.

The total weight of a 12-stamp battery is 10 tons. The two largest pieces are the mortar, six inches thick, weighing three tons, and the box-plate with its cam step. These, when fastened together with six two-inch bolts passed through the six perpendicular columns, weigh four and a half tons, and form the base of the whole structure of six feet diameter. The cam is shod with steel and readily renewed.

The stamps weigh 550 pounds each, drop from five to nine inches, and 90 to 100 times a minute, as desired. The screens and trough encircle the whole battery. The power required is 10-horse. Daily capacity, from 20 to 30 tons (according to ore). Other size batteries have proportionate capacity, strength, power and price.

This battery is claimed by its experienced designer to be one of the most simple, efficient, economical and durable pieces of mining machinery in the market.

Two mills have been constructed (an 8 and a 12-stamp) upon this plan, and we are informed that they have proved themselves to be in every particular that which has been claimed for them.

The patent belongs to the California Quartz Milling Company, having its office at room 20, Safe Deposit building. The patentee is Almarin B. Paul, who has had many years' experience with quartz mills.

The batteries are being made by the Judson Manufacturing Company and can be seen at their works across the bay, in practical working order.

Work at the Lick Observatory.

The Lick Observatory on Mount Hamilton will serve some practical purposes beneficial to every day life, as well as to aid in scientific observations of the heavens. Professor Edward S. Holden, the director, realizes that the observatory was established by Mr. Lick for the people of California, and he is arranging matters so that it will be of immediate benefit to them. In a few weeks arrangements will be perfected whereby the Mount Hamilton observatory clock will furnish the correct standard time for every railroad office throughout the State, and as far east on the Central route as

instruments. As the Mount Hamilton clock is to be connected by wire with the Central Telephone office in San Francisco the ticks from this office can be carried to every house in the city which possesses a telephone. The time can be obtained in this way: At the end of every minute, a gap of four seconds will occur. If the watch or clock of the person at the telephone does not show the correct time within five minutes, let him wait until the clock reaches one of the five-minute divisions. Then the first tick after passing the five-minute division will be followed by a gap of ten seconds. Signals will also be given for the hours. In this way the

THE NEW CIRCULAR STAMP BATTERY.

Ogden, and upon the Southern route as far as El Paso. A project is also on foot by which the ticking of the Mount Hamilton observatory clock may be heard at every telephone having connection with the telephone companies of this city. By means of a system of signals the correct hour may be obtained at any time of the day. This system Professor Holden inaugurated in Madison, and a similar system is now successfully carried on in Cincinnati. Arrangements have been made with Manager Towne by which the railroad offices will adopt the standard time as kept by the clock at Mount Hamilton. The clock at the observatory will keep absolutely the correct standard time. It is a fine piece of mechanism, and by the elaborate system of weights maintains the exact standard. Electric connection is made with the clock to San Jose, and thence to the railroad office at Fourth and Townsend, from which, as a center, the time is given every railroad office west of Ogden and El Paso. At noon and for two minutes thereafter each day the clock at Mount Hamilton will send out its signal. Dr. J. E. Keeler, for a number of years an assistant to Prof. Langley in the observations in the Pittsburg University, will take charge of the

correct standard time may be furnished to almost every house.

The ticking of the clock will not interfere with talking through the telephone. The establishment of this system of furnishing the correct time will prove of immense advantage to the community; as is well known there is frequently a variance of five or six minutes between the alleged standard clocks of this city, and a correct and universal exactness will prove of incalculable benefit to the community, especially to the business element.

In addition to this feature of the observatory, instruments have been ordered for automatically registering earthquake shocks. These instruments are from the design of Professor Ewing, who was formerly at the University of Tokio, in Japan, and had a very fine opportunity for testing them on the elevated plain of Japan, where earthquake shocks are so frequently felt. Prof. Ewing has perfected his system in a high degree and has lately made arrangements with the Cambridge Manufacturing Company of Cambridge, England, for putting such instruments on the market. A complete outfit for registering all small shocks, both in duration and amount, costs some \$330; and it is such an out-

fit that has been ordered for the Lick observatory. These instruments will be placed at the top of Mount Hamilton and thoroughly tried in that situation. If it should prove that earthquake shocks are not as frequent at the top of the mountain as in the valley below, the outfit may be moved to San Jose.

Mining Accidents.

A mining accident occurred at the Whitto mine on Kanaka creek between Jacksonville and Steven's Bar last week by which Stephen Vivian was badly injured. It seems that on the previous Friday while he was blasting with giant powder the fuse of a charge went out, failing to explode. Friday and Saturday he put in other blasts in the same ground which exploded, breaking the rock thoroughly. It was thought the first charge had also gone off with some of the subsequent ones. While working on the following Monday with a pick among the shattered rock he must have struck the unexploded powder as an explosion took place that tore a piece of flesh from his side, but without breaking any ribs, and bruising him badly about the head and body.

A miner named Jas. Smallfield had his shoulder hurt at the Zeile mine, Amador county, Wednesday of last week by the falling of a rock from the skip. The injury, however, was not very serious.

On the 13 inst., William Caddy, a miner working in the Idaho mine, Grass Valley was instantly killed by a large rock falling on him while he was standing asking a fellow miner named Mercum what time it was. The rock was part of the ledge which they were taking down, but was separated from the main ledge by a crevice. Though the miners were not aware of it, the timbers underneath the ledge gave no support to the rock. It fell a distance of about seven feet and fractured Caddy's skull and broke his neck, besides crushing his body. The rock in its descent narrowly missed killing Mercum, bruising his hand slightly as it fell.

Last week a cave occurred in the Hardscrabble mine on McAdams creek, says the Scott Valley News, completely burying Mr. Harry Mathewson, one Chinaman and partially so another Celestial. Mr. Mathewson's son, who was tending the derrick at the time, quickly gave the alarm, and in a short time a number of miners were at the scene of the mishap shoveling the dirt from off the entombed men. One of the Chinamen, who had only been caught in the cave by the foot, was quickly extricated. Mr. Mathewson, whose voice could be distinctly heard from under the heavy pile of earth, assured those that had come to his rescue that he was not badly hurt, but said the pressure was gradually becoming greater. Not a sound came from the Chinaman and it was thought that he must be dead or badly injured. After three hours of steady work, Mr. Mathewson was extricated from his perilous and uncomfortable position, but slightly injured. Work was continued, and in about three hours more the Chinaman was found, badly scared but slightly hurt. The cave was caused by the undermining of a set of timbers, which fortunately fell in such a way as to protect the men from the heavy bed of gravel above them.

FRANK YOUNG and partners sold a mining claim in Old Diggings district, Shasta county, for \$20,000 recently.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EBS.

Montana Mines.

[By Our Special Correspondent, R. G. HUSTON.]

Deer Lodge.

Deer Lodge is the county seat of Deer Lodge county, Montana, and is situated on the north side of the river of the same name, which, by the way, might well be called the river of many names; the headwaters being called Silver Bow creek. It runs under this name westward to the junction with German gulch; from there it is called Deer Lodge river to the junction with Little Blackfoot; from there it bears the euphonious cognomen of Hell Gate, probably given to it for the reason that it runs most of the way through a narrow, rocky canyon. After its junction with the Bitter Root river it is called the Missoula, and from its junction with the Jocko it is then called Clark's Fork of the Columbia. This is quite a string of names for one small river to bear in a distance of 250 miles. To a stranger to the geography of the country it would seem singular whence they all emanated, but they are all one and the same river, only called by different names.

Deer Lodge is evidently destined to become the educational center of the Territory, it being the seat of Montana College. This college is, according to the best information I can get, the best and ablest in the mountains, and is ably conducted by D. A. McMillan, who has devoted many years to that special line and being an enthusiast in his profession cannot fail in producing good results.

St. Mary's Academy is another of Deer Lodge's popular educational institutions, and is carried on by the Sisters in a very capable and thorough manner; this is, of course, only a general characteristic of all institutions under their management. These two institutions, in connection with a fine graded public school, should certainly be sufficient to provide the aspiring youth of this section with ample opportunity to improve their minds with useful knowledge.

The Territorial penitentiary is also located here, and at the time of my visit had about 100 transgressors of the law as inmates.

Eighteen miles further up the river, at the junction of Warm Springs creek, Doctors Mitchell and Mussighoff have charge of the Territorial insane. There are here now, exclusive of private patients, 130 inmates. The doctors own the Warm Springs, and take charge of the insane of the Territory on contract. They are careful, painstaking contractors, looking after the personal comfort of their patients in a very satisfactory manner.

At nearly every point of the compass in years gone by were good placer mines within 20 or 30 miles of Deer Lodge, and before the railroad was finished it was a general distributing point for those mines, and the volume of business transacted by her merchants then was simply immense. Much of this has now fallen off, partly on account of the placers being worked out and partly because all the smaller outside merchants have become direct shippers; yet the town is in a moderately prosperous condition. The increasing population in the different small valleys tributary to the Deer Lodge river and the main valley, in connection with the building of a town of 4000 inhabitants at the Anaconda smelters, makes a large increase in the population of the county, and consequently an increase in county seat business. There is also a fair showing for some quartz mines that are now being developed some 15 miles from town, in what is called the Oro Fino district. There are a number of persevering, energetic old-timers in here, and from what I can learn, there are some good properties. Should this district prove itself up by spring, it will add largely to Deer Lodge's future prosperity, as the main portion of these properties are held by Deer Lodge residents, and they have enough local pride in the welfare of their town to work to her interest to the fullest extent.

Nearly all of the secret societies have an organization here and have a good membership. The different religious sects are also well represented, so that the spiritual welfare of the town is surely not neglected. It is 45 miles south of west from Butte on the branch of the Utah Northern that was built to connect with the Northern Pacific; thus they have communication with the east and west coast by two lines, giving them ample accommodations for travel.

One property that I know of that changed hands a short time since, has been worked for years by a small, five-stamp, gold process mill and saving from \$9 to \$20 per ton, the assays running from \$25 to \$65. This looks to me like the "penny wise and pound foolish" manner of working a claim, but some men will not give in that there is any other way of doing things except their own, thus virtually robbing themselves. Why old experienced miners will be so pig-headed is a problem that I give up.

The company that bought this property are pushing, thorough-going modern miners, and are now going to work to make this property pay dividends, something it never has done, yet they have worked for years and have taken out over \$100,000. This property is in Deer Lodge county, and will be heard from as sure as twice two is four.

Since I visited Phillipsburg there has been a

company organized and incorporated to operate and develop some

Mines on Granite Mountain

Near the celebrated Granits Mountain mine of which I have spoken heretofore. I have not been able to learn whether they are operating on an extension of that or a parallel vein. They have telegraphed to Helena a strike of 2½ feet of ore similar to the old mine. The capital stock is \$5,000,000 and is officered as follows: A. M. Holter, president; Thos. Couse (of Drum Lummon fame), vice-president; H. M. Parchen, treasurer; Geo. H. Hill, secretary; J. K. Pardee, general manager. Another good producer of hulsion in this camp like the original Granite Mountain and with the same amount of ore developed as that mine has, would make the mining stock operators commence thinking that there was something in legitimate mining.

Glendale

Is located some 45 miles south of Butte on Trapper creek, and some six miles from Melrose station on the Utah Northern Railroad. This section was first heard of through the discovery of the Trapper lode in 1873; this mine is on the headwaters of the creek and lies close up to a very high spur of the main range of the Rocky mountains and between the Big Hole and Beaverhead rivers. It was a very rich deposit and still is worked quite extensively in the summer season, having a good concentrating ore; it is owned by the Hecla Consolidated Company. They have other mines that are operated in the winter time and do not or cannot run their concentrator in that season, it being a water-power. The Trapper is shut down at this season.

The smelters of this company are the mainstay of the town of Glendale. They are under the safe and economical management of Henry Kiuppenberg and give employment directly and indirectly to 250 men. Their output of bullion per day runs from eight to ten tons; this will approximate 3,000 ozs. silver, from 7 to 10 ozs. gold, and the remainder lead. The fact that this company have not failed to pay a dividend for a long term of years is proof positive that they have good mines as well as a close, economical manager. The smelter fumes make Glendale a rather unhealthy place to live in, as many people are afflicted with lead poisoning, yet they do not seem to care much for it, as they go off and stop in the valley a few days and patch up and come back and go to work again. The mine that supplies the major portion of ore is the Cleopatra. It was the buying of this mine for the consideration of \$100,000 that brought about a disagreement with Mr. N. Armstrong, who was virtually the originator and builder of the Hecla Consolidated Company, and at the time this mine was purchased the superintendent of the company. The company, most of whom live in Indianapolis, was dissatisfied with the price, and this tilt led to Mr. Armstrong's severing his connection with the company. Developments, however, have proven that his purchase was a wise one, and were it not for this mine the Hecla Consolidated's dividends would probably be few and far between. The mine is under the management of Mr. James Prout, an experienced miner, and is now running about 125 men. The old workings of this mine are a perfect labyrinth. They are now working through an incline, run on 30 degree grade down some 1800 feet, and are in the largest body of ore that they have ever worked in the mine. Tunnels and crosscuts are being run in different directions, and from developments thus far made they have ore enough in sight to run them for a long time, although it is my impression that if they do not commence timbering their mine in a workman-like manner somebody will lose their life. It is in a lime formation and ordinarily safe, but when too large a body is extracted without proper support there will sooner or later be a cave. By running a tunnel in from the foot of the mountain they could mine their ore much cheaper than they are now doing, as they now have a steam hoist to raise it from the bottom of the incline, and then run it down the mountain side to the ore-house by a cable tramway. This mine is at the highest altitude of any mine in Montana, being nearly 10,000 feet above sea level. They are now taking out 60 tons per day, which just equals the smelting capacity. The ore is sacked and transported by teams to the smelter. At the time I visited this place, they were running bob-sleds for five miles and the other five miles on wagons. They have other

Mines in the Same Vicinity.

One called the Ariadne has a fine body of concentrating ore, but, like the Old Trapper mine, is only operated in the summer season.

The Atlantis is pretty well worked out and the Sheep mine is well worked; a small quantity of low-grade ore being all that is left of this. The town at the mine is called Lion City and contains one general store run by H. Kappee, a hotel and saloon. George E. Tarhell has a fine billiard room and holds the office of justice of the peace to the general satisfaction of denizens of Lion City.

The Vipond District.

A few miles north of Lion City, has a number of promising prospects. Some ore is shipped from this district and good returns obtained; it is all taken out via Big Hole river and shipped at Divide. Dewey's Flat is another little town of large expectations, to which the Vipond district will be tributary. There are now two mills located at Dewey's Flat, but only one is running. The large one is owned

by the Monros Company, of New York, and has not been operated for a number of years.

There has been quite an excitement in the mining community in Montana about

Some Placer Mines

Discovered last fall some 50 miles further up the Big Hole river, near the old Gibbons hattle ground. To give these placers a better send-off than usual, Barney Hughes, one of the original discoverers of Alder Gulch, was among this party, and with the average placer miner stampeder, that would carry lots of weight. There is a strong probability of a large influx of people here in the spring as soon as the snow goes off, so that stock can live in that part of the country. It is at a very high altitude, up close to the main Rocky mountain range. I shall most likely take in this camp on my way over into Idaho next month, and will then be able to give a more lucid opinion concerning its merits or demerits, as the case may be.

The Pipestone District

Is just now looking up, a mine being sold there a short time ago for some \$30,000 and is now being incorporated. Developments have gone to show that a fine property is to be shown up here; gold predominates; the ore is not of very high grade but is in large quantities, so that it will, undoubtedly, be a good letter of introduction for the Pipestone district, which is about 25 miles southeast of Butte on the east side of main range.

A. W. Paul, of Three Forks, Gallatin county, has some very fine ore in a mine he has near that place. It is called the Bridgeville lode and he has just struck a small body of very high-grade ore, having from 6 to 10 inches of ore assaying from 200 to 500 ozs. silver and a large per cent lead. He says he has two feet of a second grade of ore ranging from 40 to 90 ozs. silver and the same per cent lead. This is certainly a good prospect, being a contact vein lying between lime and granite walls well defined. This is in Jefferson county within six miles of the town of Three Forks. This town was the base of operations of an English company who invested quite a sum of money in real estate there and built a number of modern houses which give the town quite a portentous appearance; but without Mr. Paul's mine turns out a veritable bonanza I am afraid the future of the town is not assured. It is within some five miles of the line of the Northern Pacific Railroad and without some side issue to bring it into prominence, the business will center on the railroad town. From this place over to Boulder is 25 miles of very poor country, fit for nothing but grazing purposes and so bleak and cold in the winter that stock would have a poor chance to make a living on it.

A San Francisco Mechanic on His Travels.

Pumping Machinery and Propellers.

EDITORS PRESS:—Since writing you last I have crossed the Atlantic, making my twentieth journey on the North Atlantic and am again in this wide and at present distracted country—distracted I say, because the present unfortunate war between labor and capital seems hourly to be widening and the end is not yet.

Since arriving in Cleveland, Ohio, in February, I have visited a large number of works of various kinds and find on nearly all hands indication of a more extended business than last year. Among other things, iron ship-building at Cleveland, Ohio, a thing which astonished me. There are now a half-dozen or more iron and steel "propellers" on the lakes, and I must maintain, so far as some acquaintance with the matter admits, that the practice there, both as to good work and processes, far exceeds the common standard. These propellers are huge vessels, flat-bottomed, with double skin arranged for water ballast, "engined" with all modern appliances, and carry from 2000 to 3000 tons. The cranks of the high and low pressure cylinders are not set at a right angle, but opposite. This is done to avoid vibration, and has been fully proved as a desirable arrangement.

I have recently returned from a trip to the Louisiana coast to examine the draining and reclamation machinery in use there. It will be impossible without drawings to convey any idea of the peculiar features of the pumps and other appliances. One thing, however, can be made plain, and that is the cost of the plants is very low, in proportion to capacity. The lifts are low and the amount of water to be handled is enormous.

The particular application is to rice plantations, the water being pumped both "out and in" at certain seasons as may be required.

The same system is applied to some extent to cranberry culture, the water being flowed over the fields when there is danger of frost and then pumped out again when the danger has passed.

The elevation of water, or water lifting it may be called, is no doubt in future to take its place in various agricultural pursuits in all parts of the country as well as in California.

The phenomenon of this city—the great "fact" so to speak, is natural gas. One is at a loss to know how to describe it or what to say about it. It is a miracle or seems so, and the sensess refuse to take it in as a commercial factor in the city's affairs. Near where I am stay-

ing a pipe 6 to 8 inches diameter extends up in this air 50 feet or more, and from the top issues a sheet of flame swaying in the wind and reaching 50 to 60 feet. The city is lighted up with a wild glare giving one the impression of a conflagration all the time. This and another on the other side of the river answer as escape pipes for surplus gas—running to waste. When one reflects that heat is power, and power is money, this waste seems a great loss, but I am informed the initial pressure is too great to permit "throttling" and these vents are necessary. A great share of smoke and "grime" of Pittsburgh has disappeared, the gas gives off no smoke. It is employed for every purpose where fuel is used, and for lighting besides. One gas company or a combination here have a capital of \$10,000,000, a fact which shows the enormous extent of this new and wonderful resource of this iron section.

J. RICHARDS.
Pittsburg, March 28th.

Winifred Mining District, Arizona.

EDITORS PRESS:—Winifred mining district is situated about 17 miles north of the town of Phoenix, Maricopa county, Arizona. There is a good level wagon road from Phoenix to the camp, with plenty of wood, and water for camp use here in the district and water for milling within 12 miles distant. The mines are of gold and silver bearing quartz, with granite and slate walls. The following is a brief description of some of the mines here, and I will describe others from time to time, as development progresses.

The Union Mine.

Is owned by Messrs. Shaw & Smith, of Phoenix. It has two distinct ledges. Shaft No. 1 is down 60 feet on a ledge of gold bearing quartz one and one-half feet wide at the surface and four and one-half feet wide at the bottom. The ore averages \$32 per ton as it is taken from the mine. Shaft No. 2 is down 20 feet on a ledge two and one-half feet wide of high-grade gold ore.

Raven Mine.

Belonging to J. M. Cotton, of Phoenix, is about one mile west from the Union. It has a shaft down 65 feet on a ledge 8 inches wide, and drifts run both ways along the ledge with ore that pays \$35 per ton free gold.

The Contentment Mine.

Owned by Messrs. Hamlin & Thomas, has a shaft down 65 feet on a ledge averaging from one inch at the surface to two feet at the bottom. The ore averages \$150 per ton and the granite on the hanging wall carries pay for about three feet in width. The granite will pay about \$20 per ton. This is a very promising mine and the owners know it, for they have four men working steadily.

The Lawrence

Is owned by W. L. Hastings. It has a shaft down 12 feet on a ledge 18 inches wide, the ore averaging \$118 per ton to \$75 per ton.

The Carbonate Hill mine is owned by Mr. Taplin, and has a shaft down 50 feet on a ledge 10 feet wide, paying \$10 per ton.

The Red Dog mine, owned by Messrs. Williams and Linville, of Phoenix, has a shaft down 40 feet on a ledge 12 inches wide, paying \$40 per ton.

The owners of most of these claims are poor men, but with capital this would be one of the best hulsion producing camps on the coast. As it is, however, there is not much going on, but if some enterprising man would put up a good custom mill with concentrators at Phoenix or Cave Creek, he would not only be considered a public benefactor, but would make money by the investment. What we want now is a mill to crush our ore—one that will mill our rock at reasonable prices.

W. L. HASTINGS.
Winifred, Arizona.

Colusa County Mines.

EDITORS PRESS:—Mining in this camp is booming. The Clyde mine, operated by Messrs. Snow, Smith, Shepard, Haskins, and McGrew, has one of Huntington's centrifugal roller mills in operation, which works like a charm. They are taking out \$1500 per month and only working eight men. This mine promises well. There is ore enough in sight to run two mills for two years. They intend to add two Frue concentrators in a short time as this mine is very rich in sulphurets, assaying as high as \$1200.

The Manzanita mine, owned by J. W. Burling of San Francisco, is looking well. This mine has a ten-stamp mill and one Wiswell mill in operation. They are working 15 men and are taking out from \$1500 to \$2000 per month. They have plenty of ore in sight.

The Empire Mill and Mining Company is a New York company who has bought the Empire mine formerly owned by Win. Cherry of this place who sold it lately for \$10,000. They have a large mill of New York pattern.

MINER.

Sulphur Creek, Colusa county, Cal.

THE Idaho mine, Nevada county, has just declared its 19th dividend. The mine is looking very well, much better than it looked last year. The shaft is now going down for the 1700 level.

MECHANICAL PROGRESS.

The Growth in Machinery Design.

Speaking of the growth of machinery design, the *American Engineer* of recent date very appropriately remarks:

In examining the multitude of illustrations and descriptions of the various machines offered through the medium of circulars and mechanical newspapers, one is continually impressed with the fact of how old ideas are revamped and worked over to present to the buying public something new and fresh. Each company is all the while rebuilding the particular line of tool or machine of which it is a specialty. The design is remodeled, the proportions changed, and all the various points of improvement enlarged upon and commented. Tools that 10 years ago were looked upon as heavy and massive are now set on one side because the demand has become positive for an increased product, and competition claims and will have a quantity of work per hour that those old proportions were not capable of performing. Manual labor has to be economized. It is done by increasing the efficiency of the tool; the depth of cut is doubled. Mechanism has provided that two cuts can be taken at the same moment; also, in addition, for certain classes of work boring is performed at the same time, so that the product of one man's labor is increased three and four fold. Then we see a change in the appearance; the old style of designing which utilized ribs, flanges with moldings, has given place to a plain, smooth surface. A simple box form, free from architectural ornaments, with corners rounded and composed of flat, broad surfaces, is now the fashion, and certainly is a great improvement to the eye, as well as in accordance with correct proportions. House architecture is one thing, but machinery should have an architecture of its own. Our readers have only to recall the gothic arch frames and entablatures of the slow-revolving engines of 25 years ago, with their curved ribs and twisted moldings, and compare them with the plain, simple, massive engines of to-day, with every pound of metal in its proper place for duty, and none wasted on external appearances. Then we find a continual growth of new machinery designed and adapted to perform operations and labor that before were done by hand, and in many cases, while executing such work very much faster, do it at the same time much more perfectly. There is also a large class of machinery offered that is brought forward, not because of being new in principle or design, but that its merits are based on superior workmanship, more perfect fitting of the details, improvement in the quality and kind of material used in its construction, and such simplicity in the working parts that a much lower grade of attendance can be used, thereby insuring a saving in the cost of the article manufactured. And last, but not least, the ever changing kaleidoscope of machines—engines, boilers, tools and apparatus—which have only the non-essentials changed, so that they can be offered to catch the inexperienced by claiming advantages that in reality do not exist. Engines, because of some wonderful proportion of a simple piston-valve, or the location of the same relative to the piston, or the peculiar advantage of a particular shifting eccentric, are the most economical and perfect engines ever offered, or ever will be; boilers, that on account of the peculiar manner in which the sheets are arranged in the shell, or a few tubes are placed, or a sheet-iron jacket is provided instead of a brick setting; great economy is insured in the amount of fuel required to evaporate water; grates for furnaces guaranteed to effect a saving of anywhere from 15 to 50 per cent in the pounds of coal required to perform the same duty—and so on through the whole list.

Mild Steel Plates for Steam Boilers.

The annual report of the Chief of the Bureau of Steam Engineering in the navy for 1883, contains the following remarks which cannot fail to be of much interest to all persons using steam boilers as well as to all engaged in the iron and steel trade. An especial interest attaches to the manifestly good results realized from the use of mild steel in place of iron in boiler construction, in the way of immunity from the great cost for repairs in the use of the latter material. The report states that: Previous to 1879-'80, boilers constructed of iron for the navy by outside parties and in the navy yards cost from 27 to 40 cents per pound, including grate-bars and other cheap fittings, and although made from the best iron procurable, would ordinarily require extensive repairs after a full cruise of three years, and very extensive repairs, or entirely new boilers after two such cruises.

With the mild steel now used by the Bureau in the boilers constructed in our navy yards for naval vessels during the last four years, we are making such boilers at an average cost of 20.68 cents per pound, and it is expected that this cost will be further reduced by the use of the improved appliances for banding and working this material which have been put up in several of the navy yards.

Thus far the Bureau has not had to make repairs to any extent upon boilers made of this material, but sufficient time has not yet elapsed to give them full trial to develop what the ordinary lifetime of such boilers will be.

The Nipsie, however, was the first vessel fitted with these steel boilers, and after returning from a cruise of over three years, during which time she steamed some 40,000 knots, her boilers giving most perfect satisfaction in their working, with not one dollar of expense in repairs for the cruise, and after being cleaned and some slight repairs made, were ready and are now again in service, in first-class condition.

The Bureau considers that the stand which it took, insisting upon a tensile strength not to exceed 60,000 pounds to the square inch, with a ductility in eight inches of not less than 25 per centum, together with its efforts to reduce to a minimum the possible number of riveted joints, for leaks, corrosion, etc., by demanding and obtaining the largest sheets that could be manufactured, has tended largely to raise the standards of excellence of material and the size of plates as now made by the principal manufacturers of the country, and that the stimulus thus given, with the honorable rivalry and zeal of our principal manufacturers using the superior products of American mines, will yet produce a still better material in maximum sizes of plates and at minimum cost.

SMOOTHING AND FLUTING STONE BY MACHINERY.—A new process for smoothing, polishing and fluting stone by machine power without the use of edge tools is now being tried in England. This process consists essentially in causing a revolving or reciprocating surface of iron to alternately bear against the surface of the stone to be worked, and then parted from it sufficiently to receive a layer of fresh sand and water between the rubbing surface and the rubbed. The rubbing surface is held down by a spring, but at intervals is raised from this rubbed surface by an eccentric cam. For fluting and similar operations a series of round bars of wrought iron are mounted in bearings and made to revolve; at the same time they are given a reciprocating movement. The block of stone to be fluted is placed on a trolley and run under the bars. Sand is sprinkled automatically over the bars or rollers as they revolve. For recessing, edge molding and similar purposes rubbing disks are mounted on vertical spindles arranged to lift automatically for about half a revolution in every four. Several different types of machines are now in actual operation. An advantage claimed for this process of working over hand labor with hammer and chisel, or machine work where cutters are forced into the stone, is that the surface of the stone is left perfectly smooth and "unstunned," and better capable of withstanding atmospheric influences.

MACHINERY AND ITS POSSIBILITIES.—Those who entertain the opinion that the possibilities of labor saving machinery are nearly exhausted and that the whole field of art industry in which it may be advantageously employed has been already covered by inventive genius, are greatly mistaken. That the achievements of human ingenuity have been wonderful, goes for the saying, and there are reasons to believe that future triumphs in this direction will be even greater and more fruitful. We are forced to this conclusion by reason and analogy. Who would have believed only a very few years ago, that the difficult and complicated processes which are now every day being wrought out by machinery in various branches of manufacture would have been possible? Thus it is that the problems unsolved by one generation become accomplished facts by another. Who shall say that what now seems impossible and improbable may not be successfully attained by those who will come after us? In the hands of the modern scientific inventor matter becomes almost miraculously endowed with life and intelligence, and with great accuracy performs those functions which the most skilled manual labor executes but slowly and imperfectly. The educated mind which stands behind this matter and directs its movements is the Aladdin's lamp which conjures up the mighty genii and compels its slave to do its bidding, however extravagant the master's demands may be.—*Manufacturer's Gazette.*

AN ELECTRICAL HEATING STOVE.—Among recent French inventions is an electrical stove, a peculiar feature of construction of which is that the wires are led through apertures formed in plates of refractory clay and plumbago. These plates are not inclosed, but are left exposed, so that the air can circulate very freely through the apertures, where it comes in contact with the red-hot wires. Wire bobbins are inserted in the apertures, each bobbin forming part of the electric circuit and all being connected for quantity. These bobbins are heated by the passage of the current and serve to heat the air as it passes to and fro over them.

A SAFETY WHEEL for roller skates has been patented by Mr. Rossiter I. Towle, of Gunnison, Col. Prongs project downward from the rear end of the skate, with a series of apertures for receiving a pin, with a roller mounted between the prongs on the pin, and a series of apertures for receiving a locking pin for locking the roller in place, and enable the skater to easily maintain his equilibrium.

INCREASE OF STEAM POWER.—Sir Lyon Playfair in his recent address before the British Association, said the steam power of the world has risen during the past 20 years from 11,500,000 to 29,000,000 horse-power, or 152 per cent.

SCIENTIFIC PROGRESS.

Effects of Impurities on Metals.

Mr W. Chandler Roberts-Austen, F. R. S., chemist of the Mint, delivered lately at the Royal Institution, London, the first of four lectures upon "Metals as Affected by Small Quantities of Impurity." He said that metallurgy has to deal at once with large masses and with small particles, for the influences of the latter upon the former is out of all proportion to their relative quantities, and their action may be chemical, or physical, or both. Minute impurities in metallic copper would render ocean telegraphy impossible. Geber proved that the "cry" of tin, or the noise which it makes when bent, can be removed by purification. Arsenic in the most minute proportion will restore the cry of tin, and its action in this respect has been known at least since the third century of our era; arsenic makes tin as brittle as zinc. The fact that such small proportions of foreign matter so alter the character of metals tended more than anything else to confirm the alchemists in the doctrine of transmutation, and encouraged them in their attempts to make gold by artificial means. A little arsenic in melted lead will make it more fluid, so that when poured down an inclined plane, say, of white paper, the lead will roll itself into small shot; with the arsenic absent it will merely chill in a black streak upon the paper. The speaker proved this by experiment, and said that it required but twelve one-hundredths of one per cent of lead to produce the effect.

Zinc, said the lecturer, melts at 412° C., and standard gold at about 900° C., but if less than 0.2 per cent of silica be added to gold, it will soften in the flame of a candle. This was also demonstrated by experiment. He stated that it may not be generally known that copper can be gilt as well by the application of an alloy of lead and gold to its surface as it can by an amalgam of mercury and gold. On the application of heat the copper absorbs the lead, and the gold is left on the surface. The process is recorded in a papyrus of the third century, now preserved at London.

The alchemists, he said, through several successive generations down to the year 1746, authoritatively taught it to be a fact that all metals were composed of mercury and sulphur, combined in different ways; and those of them who claimed to have made gold almost invariably said that they had done so "by the aid of a powder received from a stranger." Dr. James Price, of Guildford, a Fellow of the Royal Society, was the last of the alchemists who believed in the transmutation of the baser metals into gold; he lived in the eighteenth century. Raymond Lully was confined in the Tower by one of the English kings, in order that he might make gold for the mint.

Even the illustrious Robert Boyle believed in the transmutation of metals, because in the usual orthodox way he had "received from a stranger" a powder which would change 1,000 times its weight of gold into a baser substance, and he did not see why the operation might not be reversed. He had probably made what is most dreaded at the mint, an alloy of gold and lead. The lecturer here melted down one hundred sovereigns, and cast a little of the molten metal into a small bar, to show that the metal was strong and malleable and tough. To the remaining greater bulk of the molten gold he, however, added a trace of lead, and cast the mixture into a large thick bar, which, when almost cold, and when held in the palm of the hand, broke into pieces upon being tapped with a hammer. A small trace of lead, he said, will reduce the breaking strain of gold from twenty tons to five, as indicated by a testing machine.

Palladium will absorb 900 times its volume of hydrogen gas, and give it out again when heated.

The remarkable discovery has recently been made that an alloy of rhodium and lead will absorb nitrogen and oxygen, and when heated give them off with explosive violence as gun cotton does. This was also shown by experiment.

Laws of Motion.

The following are the results given in *Nature* of a very elaborate mathematical inquiry, which Prof. N. Joukowski has recently made into the laws of motion of a solid body, having hollows filled up with a homogeneous liquid. Various shapes of hollows filled with liquid have been considered, as also the case of a vortex motion of the liquid having interior friction. Some phenomena of the interior motion of the liquid itself, in the case of the solid body when caused to rotate, were verified by experiments which proved conformable to the theory; they have shown that in a body whose rotation velocity is decreasing from its surface to the center (e. g., a glass sphere filled with water, and which is brought into motion) the molecules flow from the poles to the equator, and vice versa where the rotation being suddenly stopped, the speed of rotation is on the decrease from the center to the circumference. The general conclusion of the inquiry is that if we have a hollow body filled with a liquid, and this system be brought into motion, its motion will tend to reach a limit characterized by one of the chief axes of inertia of the body taking the direction of the chief momentum of the communicated motion, and the whole system will rotate around this axis as a single body, the speed of rotation being constant and equal to

the quotient obtained from the division of the force applied by the momentum of inertia of the system with regard to this axis. M. Joukowski asks, does it not explain the circumstances that our planets, notwithstanding the variety of their occasional primary velocities, all rotate around their axes of inertia?

TEMPERANCE IN SCIENCE.—A certain temperance in science is obligatory. As mere wealth of possessions cannot guarantee happiness, neither can a superfluity of learning insure wisdom. When this body from overfeeding grows plethoric, its vital energies subside and its life is endangered. The intellect may be mischievously crammed with science. How much we know is not the best question, but how we got what we know, and what we can do with it; and, above all, what it has made of us. The tendency of training now is to subordinate the soul to that which should be merely its endowment and adornment; to turn the thinker into a mere walking encyclopedia, text book, or circle of mechanic arts; not to produce the highest types of man. What ridiculous and pitiable creations are these—an authority in physics who cannot speak the truth? a leader in natural history who is given over to the torments of envy? a god in chemical research sick of some false quotation? a youthful prodigy of mathematical science tottering with unelastic steps and outstretched arms to grasp his future fame? Yet no one will deny that the temperate pursuit of any branch of science has a tendency to produce such characters, by elevating to undue importance the individual accumulation of scientific facts and scientific theories, to the neglect and depreciation of that spirit of truth which alone can inspire and justify an earnest study of the material universe. Reflect that it is as true of science as of religion, that the mere letter of its code threatens its devotee with intellectual death, and that only by breathing its purest spirit can the man of science keep his better character alive.

THE PITTSBURG OIL AND GAS YIELD TEMPORARY.—Professor Lesley has recently published an interesting paper on the "geology of the Pittsburgh coal region," in which he speaks of the yield of oil and gas as follows: "I take the opportunity to express my opinion in the strongest terms, that the amazing exhibition of oil and gas which has characterized the last 20 years, and will probably characterize the next 10 or 20 years, is nevertheless, not only geologically but historically, a temporary and vanishing phenomenon—one which young men will live to see come to its natural end. And this opinion I do not entertain in any loose or unreasonable form; it is the result of both an active and a thoughtful acquaintance with the subject." Concerning coal, however, the professor entertains quite different views. He says that the amount of coal in the Pittsburgh region is estimated at about 30,000,000,000 tons—an amount practically inexhaustible, at least for centuries. During 1884, 11,000,000 tons were taken from the Pittsburgh bed—an output of about 60 per cent of the whole bituminous coal production of the State, and about 33 per cent of the shipments of anthracite.

THE ORIGIN OF THE AMERICAN DOG.—Dr. A. S. Packard has contributed to the September number of the *American Naturalist*, a paper of universal interest on the origin of American dogs. He concludes that, though the impression that the domestic dog of the Old World has descended from the wild species distinct from the wolf, may be well founded in America, the evidence tends to prove that the Esquimo and other domestic varieties of dogs were domesticated by the aborigines and used by them, long anterior to the discovery of the continent by Europeans, the varieties in question originating from the gray wolf or the prairie wolf. The subject is fully illustrated by quotations from the accounts of the early explorers. This opinion is supported by the well established fact that the domestic dog, and gray as well as the prairie wolf will hybridize.

MASSSES OF SNOW MOVED BY WIND.—At a meeting of the Geographical Society of Paris, M. Schrader read a paper on the masses of snow moved about by wind among mountains. These masses are not moved about by chance—they obey very simple laws, which cause them to be deposited at spots where the wind is diminished in intensity, and give them forms which may be easily analyzed if the quality of the snow, the force and direction of the wind, and the contour of the mountain be taken into account.

MAGNETIC DISTURBANCES AND CYCLONE STORMS.—Balfour Stewart and William Lant Carpenter have made a preliminary comparison between the dates of cyclonic storms in Great Britain and those of magnetic disturbances at the Kew Observatory. Finding that in 30 cases compared, 23 presented a distinct magnetic disturbance preceding the storm, for the most part, by somewhat more than a day, the investigators consequently intend to pursue the subject exhaustively.

IS THERE A MAGNETIC SENSE?—A European observer, Dr. Ochrowski, believes that he has found evidence of the existence of a "magnetic sense." It is stated that by hanging a magnetic tube, called a hypnoscope, from the index finger he realizes peculiar sensations, somewhat resembling the effects produced by the action of the air in front of an electric machine.

Passing Events.

The unusual heavy rains of the past week or two have prevailed nearly all over the State. In some places this abundance of water has been a hindrance to mining operations; in others it has been of advantage. In former days all the rainfall was utilized in working surface deposits, but now the water is applied for power in working quartz machinery, though of course some is still used in sluicing, etc. Still, abundant water seasons are important to the mining interests, though not so much so as was the case years ago.

In printing a four-page supplement to the Press this week we devote considerable space to describing the largest custom metallurgical works on the coast. The article will be read with interest by miners who have ores to work or sell, or hollion to refine.

More interest is being taken just now in both manganese and chrome ores than for years past. Those owning manganese deposits will do well to see that they keep their records of title good, for if the low freights continue, a better demand will spring up. The same is the case in the matter of chrome ore.

Our California gold quartz mines are in demand just now and intending purchasers find difficulty in obtaining outfitted mines, properly developed, at what they call anything like a reasonable price. These people will have to take hold of prospects and develop them, the same as our own miners have to do.

The Lixiviation Process.

Its Success at Lake Valley.

Some time since, in our editorial columns, we called attention to the adoption of the lixiviation process at Lake Valley, New Mexico. The successful treatment of these ores has always constituted one of the most difficult metallurgical problems ever met. Smelting, raw milling and concentration, have each in turn failed to give satisfactory results, and it has remained for the leaching process alone to meet the requirements of economy and high percentage of extraction.

The process used is the Russell process, and both mine and mill are under the management of Dr. F. M. Endlish, whose name is most familiar as a chemist and mineralogist.

The unusual difficulties presented by the Lake Valley ores called for mechanical and chemical treatment of an almost extraordinary character, and the present mill extraction of 87 per cent has been reached only after numerous changes, and the treatment of over a thousand tons of ore. The rate of increase in the percentage extracted is now about one per cent for each 100 tons treated, and in the treatment of the next 500 tons will probably reach 92 per cent, although the ore is crushed through a 16 screen, and chloridized with only 7 per cent salt. The mill is probably the most automatically arranged of any so far constructed. With the exception of a small amount of flue dust there is no handling of the ore from the time it enters the Blake crusher until it appears on the cooling floor. By a contrivance of Dr. Endlish's, even the flue dust from the dust chambers of the chloriding furnaces is delivered at the lower end of the furnaces mixed with the coarse, hot ore. From the cooling floor, the chloridized ore is conveyed by three elevators starting from three different points, under the cooling floor to bins over the ore tuhs, each holding 20 tons.

The apparatus of the leaching department consists of six ore tuhs, each 12' diameter and 5' deep; five precipitating tanks, each 9' diameter and 9' deep, and three storage tanks of same size. Also, a Johnson 15-inch filter press, and a small Knowles pump for handling the solutions. Each ore tuh is also provided with an Allen lead-lined syphon pump. These are on the ejector principle, and seem to maintain a constant vacuum underneath the filters, and so increase the speed of leaching, and also deliver the solution at any desired point.

The ore tuhs are loaded to a depth of four and one-half feet deep, which is equal to 20 tons for each tuh, or 120 tons in all. By means of the huns the loading of 120 tons can be accomplished in three and one-half hours.

The total cost of treating the ore by the new leaching process, after it leaves the cooling floor, is 74 cents per ton for chemicals, and from 25 to 40 cents per ton for labor, the last item varying universally as the number of tons treated per day.

The mill has a leaching capacity of 120 tons per day, and a chloridizing capacity of 80 to 90 tons. The crushing capacity, owing to the poor quality of the rolls, and the hard character of the ore has so far been only 60 tons.

The grade of the ore treated is 14 to 20 ounces, and the total expense of treatment about \$5 per ton. The mining and hauling are extremely low, being about \$3.75 per ton.

The company will therefore be able to make a fair profit on their 14-ounce ore, of which there are immense quantities.

In short, as far as economical management and the successful treatment of low grade and unusually refractory ore is concerned, the example of the Sierra Grande Co. is worthy of imitation.

PRACTICAL HYDRAULICS.—Mr. Randall's book on Practical Hydraulics will very shortly be ready for delivery. There is still one more number of the series of articles to appear in the Press, when the subject will be concluded. As a work of reference on this subject, and one which will save much labor in calculations, Mr. Randall's book will be invaluable. Copies of the work can shortly be furnished to those ordering them.

ABOUT 400 tons of chrome ore have been shipped East from Livermore, Alameda county, this season, by rail, and shipments will continue as long as low freight rates warrant.

Cost of Mine Supplies.

There is one great advantage the miners of the State of California have in pursuing their work, and that is the comparative cheapness of ordinary mine supplies. In the other States and Territories on the coast they are generally higher, owing to the cost of transportation. This State is now so well settled up and has such railroad facilities with distributing centers that our miners can get their supplies readily, quickly and cheaply.

The price of supplies has an important influence on the mining industries, more so than most people imagine. Processes which yield a fair profit in localities where labor and supplies are to be had at low rates, would result in a loss in a great portion of the mining districts in what is known as the Far West, and processes and methods developed in other regions must be modified to suit the local economical conditions or be abandoned. The higher cost of mining supplies in many camps as compared with the prices asked at centers like San Francisco, St. Louis, or Chicago is almost entirely due to expense of transportation. This often exceeds the original cost of the article transported, and sometimes the relative values of materials in their technical applications.

Steel may be worth four times as much as iron at commercial centers, but as the freight on each metal is the same, steel at a mining camp may be worth but twice as much as iron. If, for a given purpose, steel will do three times as much service as iron, the latter will be employed at centers of commerce, while the former will be more economical in the mining regions.

The price of articles of uniform quality, such as candles and quicksilver, is a gauge of the rates of transportation and an index of the cost of supplies excepting such as the locality itself may supply. Salt is naturally cheap in this State and at Salt Lake, while at long distances from the deposits or manufacturing, it is extremely expensive. Last summer some of the Butte, Montana, mines came near closing down because the freight rates were so high on the salt they were compelled to use in beneficiating the ores. In some places in Utah salt has been sold for \$8 per ton when it was selling for \$100 per ton in Arizona. It might be clearly more economical to amalgamate raw ore in Arizona containing a considerable amount of rebellious silver minerals, which it would be folly not to roast if found near the salt deposits of Utah. Similarly it will make a great difference in the system of timbering a mine whether timber is worth \$6 or \$100 per thousand feet.

In what are called supplies are included coal, charcoal, wood, timber, iron, steel, candles, explosives and sundries; among sundries are lubricating oil, hardware, ice, water, etc. The Census Bureau obtained statistics of the cost of these articles all over the United States and have tabulated statements on the report. With 589 deep mines reported in the different States and Territories, the total cost for coal for a year amounted to \$17,397; charcoal \$13,400; wood, \$1,752,203; timber, \$859,172; iron, \$118,376; steel, \$71,718; candles, \$248,485; explosives, \$502,792; sundries, \$1,097,719. The total cost of supplies for the 589 mines was \$4,681,267. The number of mines reported includes only a fraction of the deep precious-metal mines of the country, but also includes most of the great consumers. A single one of the larger Comstock mines spends more for supplies than scores of small mines do elsewhere.

It is probable that nearly one-half of the total is included in the above statement, and the whole amount expended in this way is between nine and ten millions annually. There is no relation between consumption of supplies and production. The cost of mine and mill supplies on the Comstock in the census year amounted to \$3,018,839; of this \$2,205,832 was for mine use, and \$813,026 for mill use. The greatest expense was for wood—\$1,500,000; timber cost \$500,000, and explosives \$208,000.

THE Consolidated Virginia and California Mining Company has to pay the Suro Tunnel Company a royalty of \$10,000 for the mouth of March. The hollion product for March was \$141,000, subject to the discount on silver. The net earnings for the month, above expenses, were \$7000. The company has \$30,000 in the treasury. The grade of the ore being worked is low at present.

Foundry Notes.

Fulton Iron Works.

The Fulton Iron Works are engaged at present on considerable marine work, something of which they seem to make a successful specialty, for they have much more of it to do than other establishments. They have now on hand a contract for the new ferry boat for the San Diego Ferry Company, which is to ply between the city and the peninsula on the opposite shore of the bay. The new boat is 100 feet long and 26 feet beam. She is being built here and will steam down. The engine has a 16-inch diameter cylinder, with five-foot stroke; boiler 59 inches in diameter, with fire box 68 inches long and 54 inches wide.

They have just shipped this week a small engine for a fishing steamer to be used at Astoria. She is a high-pressure boat.

A compound engine is also being built for a launch which is to go to Mexico. The cylinders are 7½ and 14½ inches.

They have completed and ready for delivery two compound engines for two lumber schooners for the coast trade. These are 11 and 12 by 18-inch stroke; the boilers are of steel, 8 feet in diameter.

A set of compound engines is being built for a new steamer to take the place of the lost Planter, owned by the Inter-Island Steam Navigation Company, of Honolulu. The cylinders are 12 and 22 by 18 inches, and the boiler is 8 feet 6 inches in diameter. This is the fourth set of engines built by the Fulton Works for this company.

A short time since they fitted out the steamer Falcon, for the Wilmington Transportation Company, the second job of the same kind for this company. They had a contract for the boat, engines, boilers, etc. She was guaranteed a speed of 7½ knots, but made 9 knots on her trial trips and is capable of 10 knots. The engines are compound 12 and 22 by 18 inches.

They are building a dredging machine for the Government to be used in the improvement of rivers emptying into Suisun and San Pablo bays. The hull is 71 feet long on deck and 65 feet on the bottom; beams, 36 feet; depth, 8 feet. There are 26 heavy floor timbers 8x12; and 9 keelsons 12x12. The frame for supporting the crane for the bucket-ladder is to be built of steel and iron in the form of an arch springing from one side of the hull to the other, and on the extreme forward end. The main driving engines are fitted with reversing link motion and have cylinders 12 inches in diameter and 18 inch stroke. This dredger will have 31 buckets, each with a capacity of four cubic feet. Auxiliary engines are provided for raising and lowering the bucket-ladder, etc. There are two locomotive boilers 22 feet long and 60 inch diameter of shell. There are the usual steam pumps, etc.

Among the miscellaneous work in the shops are four large sized Huntington mills, to go to quartz mines. They are building a Tustin pulverizer which is going to St. Petersburg, Russia, for a gold mining property. They have also, ready for shipment, a complete 20-stamp mill for the Argo mine, New Mexico. They are also just finishing the ice machinery for Merry, Faull & Co.'s packing establishment, and have more or less small work on hand.

THE BIG BEND TUNNEL, of which we gave a brief account last week, was cut through on Monday. The river is still high, and they will have to wait for lower water to complete the entrance of the tunnel and make connection with the river bed. In next week's Press we shall give a full description of this great work, with suitable engravings.

THE PACIFIC GALENA SMELTING furnace, made by the Pacific Iron Works, of this city, is in use on lead ores all over this coast, and has been very successful. This form of water-jacket furnace seems to be preferred at the principal smelting works, including that of the Selby Smelting and Lead Company, at Vallejo Junction, in this State.

HARTSFELD FURNACE.—A 20-ton Hartsfeld portable furnace has been shipped by the Hartsfeld Furnace Co. of Newport, Ky., to W. T. Garratt & Co. of this city, agents and licensed manufacturers for the Pacific Coast. We gave a detailed description and illustration of the furnace in the Press of October 24, 1885.

Working Gold and Silver Ores—No. 2.

The Chilian Mill.

In continuing his description of the arrastre and Chilian mill, and the methods of working ore with these appliances in Mexico, Mr. E. C. Van Blarcom says:

The Chilian mill is to all intents and purposes a mill-stone set on edge and arranged so it will revolve in a circular track; the axis upon which it revolves is pivoted at one end and the horses or mules are attached to the other. A circular excavation is first made in the ground some eighteen feet in diameter and about one foot deep. Directly in the center of this excavation a hole is dug at least four feet deep. In this hole a piece of timber ten inches square (b', Fig. 3) is set, plumbed and made secure with masonry.

Before setting the stick a hole should be bored in one end and a piece of two-inch round iron (c', Fig. 3) is let in. An iron collar is placed around the end of the timber to keep it from splitting.

Around the periphery of the circular excavation a fence or wall of flat stones or plank (d', Fig. 3) is erected. The enclosure is paved with the flattest stones procurable, care being taken to make it as nearly level as the roughness of the stones will permit. Directly in the track of this grinding wheel large stones, at least eighteen inches thick, should be laid. If small stones were laid here, the weight of the grinding wheel would crush them.

The crushing wheel (x, Fig. 3) may be of any size; for a small hacienda one five feet in diameter and 14 inches wide on the face would be appropriate.

Through the center of the wheel a hole is cut for the axle; this hole may be cut round when the axle is intended to work directly on the stone, or it may be cut square and a wooden hushing to reduce the wear on the axle put in. Where it can be had, the axle (a', Fig. 3) should be made of hard wood, but a piece of eight inch-square and even lighter timber will serve the purpose; it should be made round where it bears on the grinding wheel. The wheel is kept in place, on the axle, by washers made of two-inch plank (y, Fig. 3), and two one and one-half inch round iron linch pins (z, Fig. 3). The pin, c, in the upright post in the center of the mill, works in a two-inch hole in the axle; grease may be used on this pin, but none should be used on the wheel, as it would be continually dropping into the ore—this would affect the quicksilver during amalgamation.

The Settler.

The settler is shown in Figs. 4, 5 and 6. It has a tank j (Figs. 4, 5 and 6), 6 feet long by 18 inches wide in the clear. Three sides of the tank are built up of masonry and the fourth is closed by a two-inch plank, p (Fig. 5), in which holes are bored for discharging the contents. These holes are fitted with wooden plugs, l (Figs. 4 and 5). Water is introduced into the tank through the pipe k (Figs. 4 and 5). If preferred, the pipe may be on one side.

The slimes to be washed are dumped on the platform at one side of the tank. Stairs lead up to the platform, as shown by the drawings.

In Figs. 4 and 5, m, are planks built into the side walls to hold the end plank, p; n, vertical box to receive tailings; o, sluice for running off tailings; q, amalgam traps in discharge sluice.

The inside of the tank must be made smooth to facilitate collecting the amalgam when the charge has been washed. This can be effected by polishing the lining with a smooth stone as it is drying.

The Retorting Furnace.

A quicksilver flask cut off square at both ends, v (Fig. 8), is built into a masonry support. The upper end is flared and is fitted with a circular iron plate t, through which a number of holes about one-quarter of an inch in diameter have been bored. The lower end of the pipe drops into a chamber 17 inches square and 11 inches high. The pipe dips into water which is let into the chamber through the pipe, r, and overflows through the opening s. Another tank, having the neck cut off, is used as the retort proper, w (Fig. 8). It is placed open end down, on the plate t. An opening, u (Fig. 7), shown by the dotted lines, is left in the side of the furnace. This opening extends to the floor of the chamber and is used for handling the vessel put under the mouth of the tube to catch the condensed quicksilver.

While restoring is in progress it should be dammed up above the water level.

Figs. 9 and 10 show a convenient strap to be used when any of the timbers used are built, i. e., made of more than one piece.

A piece of half inch by one and one-half inch iron is cut into suitable lengths; one end is dumped and a suitable thread cut on it; through the other end a hole is bored sufficiently large to take a bolt the same size as that made on the other end.

These straps are placed around the timber—the bolt end of one going through the hole in

The process given here is not to be considered a perfect one, although in theory it is. As the mechanical losses are large it is not to be recommended for the reduction of fine gold ores on a large scale; but, for this prospector, man of small capital or as an expedient in out-of-the-way places it can be recommended.

The ore should be spalled to about egg size, and carefully sorted. The assorted ore is crushed to a size which will pass through a sieve of nine meshes to the square inch—pea size. This crushing is effected either by hand or a Chilian mill (a sec-

silver is added by straining it through two thicknesses of coarse cotton cloth, the shower of quicksilver being evenly spread over the charge. As the grinding progresses the remainder of the charge is added, and the balance of the quicksilver. The total amount of quicksilver added should be in excess of the amount calculated to be necessary to take up the gold; it is desirable to keep the amalgam soft and well disintegrated while the grinding continues. Water is added from time to time as the charge thickens.

When the charge is thoroughly ground it should be in the state of medium thick mud, but not plastic; there should be enough buoyancy in the mass to keep the mercury suspended. Care must be taken not to add too much water, as it will materially impede the grinding.

Small portions of the charge are taken out from time to time and washed down in a horn spoon. These "assays" will show how the grinding and amalgamation is progressing, and also show if it is necessary to add more quicksilver. If the amalgam in the spoon is at all hard more quicksilver must be added immediately.

The time necessary to complete the amalgamation depends entirely upon the ore treated. If the gold is coarse the amalgamation may be completed in 12 hours; whereas, if the gold be very fine it may be necessary to continue the grinding for 72 hours. From 12 to 72 hours may be given as the limits for the time of grinding. The safe way will be to grind to absolute slimes but ordinarily a point will be found beyond which grinding will be unprofitable—this is a matter for experiment on the part of the amalgamator.

When the amalgamation is completed the slimes are removed in tubs or barrels to the settler. (Figs. 4, 5, and 6.)

After each grinding the arrastre is scraped clean with a horn spoon; but, as a certain amount of amalgam will find its way into the tamping between the stones in the pavement of the arrastre it will be found profitable to occasionally dig out the clay tamping and pan it down. When an arrastre is to be abandoned the whole bottom should be taken up and panned down. Unless the mules are in very good condition they should not be run for longer shifts than six hours. When working on the arrastre the mules should be blindfolded. The slimes from the arrastre are dumped on the platform of the settler.

Before commencing the operation the settler is partially filled with water; slimes and water are added from time to time until the tank is full. A constant agitation must be kept up. This is best effected by two men, stripped to a breech-clout getting in the tank; by a constant motion of the feet and legs the quicksilver is separated and settles to the bottom. From time to time the plugs are removed and the tailings drawn off. The sluice through which the tailings are drawn off is provided with riffles or catch basins for catching any amalgam that may be mechanically carried over.

After the entire charge has been settled the amalgam and sulphurets, which have collected in the bottom of the settler, are pounded down by hand in a pan or batea to separate them. When the amalgam has been thoroughly washed it is strained through a canvas bag to remove the superfluous quicksilver. This quicksilver will always be found to contain a certain percentage of gold; it is very desirable, as it takes up gold much more readily than pure quicksilver.

The Furnace for Retorting

Is shown by Figs. 7 and 8. If there be enough amalgam to fill the retort, it, the retort, is lined with coarse straw paper and then the amalgam is packed in tight and rammed down with a block of wood and a hammer. The retort is now placed, mouth downward, on the perforated plate which covers the tube leading down into the water. The joint is carefully luted with a mixture of clay and wood ashes, and then a coating of this mixture about one inch thick is applied to the entire retort. The retort is gradually heated up with a charcoal fire. Great care must be taken with the fire, for if the retort is heated too rapidly an explosion is liable to occur.

When the clay luting is thoroughly dried and shows no cracks, the fire is increased until the entire retort is covered with live coals. Care must be taken not to fire so hard as to melt the gold. When the amalgam to be retorted is not sufficient in quantity to fill the retort, it is rolled up in a piece of coarse cotton cloth, placed inside the retort and retorted as above.

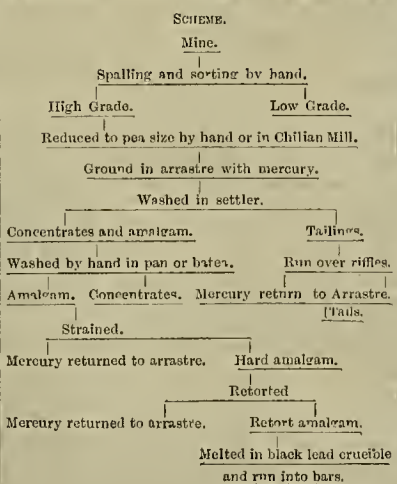

To keep the fire from falling off the furnaces a wall of small stones or bricks is built up around the outer edge of the furnace. The volatilized quicksilver passes down and is condensed by the water in the bottom of the furnace. A pan or other vessel should be placed in the water directly below the tube leading to the retort to catch the quicksilver as it condenses. A stream should be kept running while the retorting is going on.

If more amalgam is made (regularly) than can be conveniently retorted in one retort, the size of the furnace may be increased and any number of retorts run at the same time. The gold which comes from the retorts still contains a small percentage of quicksilver, which is removed by melting down in black-lead crucibles. The gold can now be run into bars.

the end of another, and by means of nuts they are set up tight.

Reduction of Gold Ores in the Arrastre.

tion of which is shown in the drawings Fig. 9). When the crushing is done in the Chilian mill the cobbed ore is distributed on the track of the crushing wheel in a layer about three inches thick; after the wheel has passed over the ore it is stirred up with a rude rake. The crushing and stirring is continued until the ore approximates the desired size, when it is drawn toward the center of the mill and a new charge is introduced. After crushing the ore is sifted, and any that is not fine enough is returned to the mill for further crushing.

The practice is to crush the ore as it is needed, but an amount might be crushed and kept in store. Two or three animals are used at a time on the mill. After being reduced to pea size the ore goes to the arrastre. For an eight foot arrastre (Figs. 1 and 3 given in last week's PRESS), to be run by one mule, the charge is 450 pounds.

About one-half of the charge is placed in the arrastre at the commencement of the operation, enough water being added to thoroughly moisten the ore. With the charge is added two or three ounces of quicksilver. The quick-

PRACTICAL HYDRAULICS.*

NUMBER 26. COPYRIGHTED.

PRINCIPLES OF HYDRAULICS.

[Written for MINING AND SCIENTIFIC PRESS by P. M. RANDALL.]

$$v=4.862 \text{ feet.}$$

Whence, $q=12,833.25 \times 4.862=62,395.26$ cubic feet.—Ans.

INTERPOLATION.

For the purposes of interpolation where the extremes are not far apart, in Table 27, the velocities, without any considerable error in practice may be assumed proportionate, either to the sines of slope on one hand, or to the hydraulic mean depths on the other.

Ex. 112.—The coefficient of roughness of bed being $n=.012$, the hydraulic mean depth .5, the extreme sines of slope $s=.0015$, and $s=.005$, what, in a regular arithmetical series will be the six interpolated velocities?

Cal.—By Table 27, for $n=.012$, and for the given hydraulic mean depths the velocities due the given slopes are 3.134 and 5.625 feet per second. Then $(5.625-3.134) \div 7=.356$ common difference.

Whence, the interpolated velocities will be 3.490, 3.846, 4.202, 4.558, 4.914 and 5.270 feet.—Ans.

Ex. 113.—The coefficient of roughness of bed being $n=.012$, the given sine of slope $s=.0007$, the extremes of hydraulic mean depths 1 and 2, what, in a regular arithmetical series, will be the three interpolated velocities?

Cal.—By Table 27, for $n=.012$, the velocities due the given hydraulic mean depths 1 and 2, are 3.360 and 5.302 feet. Then $(5.302-3.360) \div 4=.4855$ common difference; whence the interpolated velocities will be 3.845, 4.330, and 4.816 feet.—Ans.

MEAN VELOCITY.

To find the mean velocity of an open stream of water, various devices, as tight tin tubes, loaded each at one end, so as to float vertically in still water, and as nearly so in streams as the current will permit—the Pitot tube, patent logs, etc., are employed. Wooden floats, of nearly the specific gravity of water, are, however, mostly used in common practice. By these the surface velocity is taken; thence the mean velocity is determined by calculation based on experimental data.

Having chosen a straight section of a stream free as possible, to be found from eddies, roughness and foulness of bottom, and having divided the stream into sections parallel with its course, cast into it wooden floats, note the time taken by a float in each section to pass through a given distance, as 100 feet, and thence determine the surface sectional velocity per second. Divide the sum of the several velocities of the floats by their numbers; the result will be the mean surface velocity of the stream per second; whence, the mean velocity for the mean depth of the entire cross section can be calculated as above stated.

CENTRAL SURFACE AND CORRESPONDING MEAN VELOCITY.

Having made several trials with floats, as above described, let the greatest velocity, well established by any one of them, be taken as the central surface velocity. For the central surface velocities, from five-tenths (.5) of a foot to six (6) feet, the corresponding mean velocities have, by the aid of experimental data, and the following empirical formula of Prony, viz.:

$$v=V \left\{ \frac{V+7.782}{V+10.345} \right\}, \quad (286)$$

been computed, and the results arranged in Table 30.

In Eq. (286), v denotes the mean velocity, and V the central surface velocity of a stream of water.

TABLE 30.

Central Surface and Corresponding Mean Velocities of Streams.

Central Surface Velocity, Feet.	Mean Velocity, Feet.	Central Surface Velocity, Feet.	Mean Velocity, Feet.
.5	.382	3.5	2.852
1.0	.774	4.0	3.284
1.5	1.174	4.5	3.721
2.0	1.584	5.0	4.165
2.5	2.000	5.5	4.609
3.0	2.424	6.0	5.058

Ex. 114.—What is the quantity of flow in a stream in which the cross section is 50 square feet and the central surface velocity 3 feet per second?

Cal.—In Table 30, opposite the given central sur-

face velocity 3 feet, find in mean velocity column 2.424 feet. Then

$$2.424 \times 50 = 121.2 \text{ cubic feet per second.} \text{—Ans.}$$

Rough Approximate.—A rough approximate is readily found by taking one-half the product of the surface width, central depth, and central velocity of a stream.

This rough approximate rule is based on the assumption that the cross section of stream is parabolic, and the mean velocity equal to three-fourths (.75) of the central surface velocity.

Ex. 115.—The surface width of a stream is 25 feet, the central depth 4 feet, and the central surface velocity 1.5 feet, what is the flow per second?

$$\text{Cal.}—25 \times 4 \times 1.5 \div 2 = 75 \text{ cubic feet.} \text{—Ans.}$$

QUANTITY OF WATER REQUIRED FOR VARIOUS MINING PURPOSES.

Hydraulic Mining.—Hydraulic mining, properly, comprises all classes of mining in which the metallic substance sought is separated from its earthy mass or matrix by means of water. The term, however, as employed in California, is, for the most part, restricted to that class of mining in which a stream of water is projected under great pressure from a nozzle against a deep gravel deposit or earthy formation for the purposes of disintegrating the mass, thence freeing the gold and carrying off the debris. The relation of the quantity of water employed to that of material removed varies in different mines and in different parts of the same mine.

Duty of an Inch of Water.—This phrase involves in its meaning the work of disintegration; but as the projecting head is variable from 50 to 350 feet and upward, the phrase seems to refer chiefly to that portion of the work performed by the water in carrying off the debris in a sluice, the grade of which is usually 6 inches per 12 feet. Experience shows that the duty of a 24-hour miner's inch, under a 7-inch head, equivalent, as shown by Table 8, to 2.230 cubic feet flow in twenty-four hours, is in the lower portions of certain mines as follows:

	Cubic Yards.
North Bloomfield Mine.....	3.5
Milton Mine.....	2.4
Excelsior Mine.....	2.0
Gold Run Mine.....	3.5

In the upper portions of the same mines the duty of the miner's inch was much greater, say 5 to 10 cubic yards.

Thus, at the Gold Run mine, for six years to November 1, 1881, 4,389,791 cubic yards were worked with 1,124,367 miner's inches of water; whence the duty of per inch was 3.9 cubic yards.

In the State Engineer's report to the legislature of the State of California, 1880, the estimated inch duty is as follows, viz.:

	Cubic Yards.
Yuba River Mines.....	3.5
Bear River Mines.....	3.0
American River Mines.....	4.5

One instance is brought to the attention of the writer showing the inch duty to have been 19 cubic yards.

Drift Mining.—Drift mining consists in excavating the lower material of a gravel mine by hand, raising it through a shaft to the surface, or carrying it by wheelbarrows and cars through a tunnel to a dump, whence it is shoveled or piped into a sluice to be freed of its gold, and thereupon carried off as debris. As the larger cobble, bowlders and barren blocks of rock are usually left in a drift mine, and the material broken smaller than in hydraulic mining, a correspondingly less quantity of water is required for working an cubic yard.

The duty of a 24-hour inch (2.230 cubic feet) in this class of mining varies according to the character of the gravel, whether hard and cemented, clayey or sandy, from 3 to 20 cubic yards.

Quartz Mining.—The contents of one ton of quartz, in its normal condition in the lode, is estimated at 13 cubic feet, and at 20 cubic feet when the quartz is broken, as it usually comes from the mine. Adopting the lode measurement it is seen that a cubic yard of quartz is $27 \div 13 = 2.08$ tons nearly.

Experience shows that the duty of a miner's inch as follows:

Duty of a miner's inch (under 4-inch pressure) in the reduction and amalgamation of silver ores in a "stamp silver mill," Nevada, 3.25 cubic yards or 6.76 tons; in the reduction and amalgamation by riffles, or copper plate, in "stamp gold mill," California, 5.78 cubic yards or 12 tons.

Duty of miner's inch (under 7-inch pressure) in the former case (silver) 4.3 cubic yards, or 8.93 tons; in the latter case (gold) 6.65 cubic yards, or 15.88 tons.

The volume of water to that of ore is, in working

silver ores, Nevada, 19.5 to 1; in working gold ores, California, 11.1 to 1; in working copper ores, Lake Superior, 20 to 1.

QUANTITY OF WATER REQUIRED FOR PURPOSES OF IRRIGATION.

As the area of land is usually expressed in denomination of acres, a convenient unit of measure for irrigating purposes is that quantity of water which will cover one acre one inch deep. This quantity is 3,630 cubic feet.

The total depth of irrigation, as practiced in California, varies for different soils and products from two to five feet.

Ex. 116.—It is proposed to irrigate 1000 acres of land, 50 inches in depth, in 100 days, by means of a canal whose fall per mile is to be 1.056 feet ($s=.0002$), coefficient of roughness of bed $n=.017$, bottom width equal to slant width of side, and ratio of depth to base of bank as 1:2, what will be the dimensions of the canal?

$$\text{Cal.}—3630 \times 50 \div 100 = 1815 \text{ cubic feet; } 1815 \times 1000 = 1,815,000 \text{ cubic feet per day; } 1,815,000 \div 86400 = 21,007 \text{ cubic feet per second.}$$

Assume, by way of trial, the hydraulic mean depth to be 1.25. Then, in Table 27, for $n=.017$, the velocity for hydraulic mean depth 1.25 is 1.386 feet per second; whence, $21,007 \div 1.386 = 15,16$ square feet, area of cross section of canal.

By Table 28, for hydraulic mean depth 1.25, the sectional area is 16.59 square feet, under trapezoid 1:2. This approximate is sufficiently near to meet the requirements of practice. The dimensions of the canal then, as per Table 28, are: side=bottom=4.426 feet; depth=1.980 feet.—Ans.

If greater accuracy be required, proceed as in the solution of Ex. 99.

Ex. 117.—How many acres can be irrigated 40 inches in depth in 75 days, by means of a semi-hexagonal canal five feet deep, the fall per mile being 1.584 feet ($s=.0003$), and the coefficient for roughness of bed being $n=.025$?

Cal.—By Table 28, it is seen that the hydraulic mean depth and the area of a semi-hexagon five feet deep, are respectively: 2.5 feet and 43.301 square feet.

By Table 27, for $n=.025$, fall per mile 1.584 feet, the velocity corresponding to hydraulic mean depth 2.5 is 1.872 feet per second.

$$\text{Then } 43.301 \times 1.872 = 81,059.72 \text{ cubic feet per second; } 81,059.72 \times 86400 \times 75 = 525,265,378.5 \text{ cubic feet; } 3,630 \times 40 = 145,200 \text{ cubic feet per acre; } 525,265,378.5 \div 145,200 = 3617.5 \text{ acres.} \text{—Ans.}$$

MEASUREMENT OF THE POWER OF WATER AS A MOTOR.

The unit in the measurement of power is a foot-pound—that is, the amount of energy necessary to raise one pound weight vertically through a distance of one foot. On the other hand, one pound falling by the force of gravity through a distance of one foot, generates a foot-pound.

The amount of energy required to raise one pound vertically 550 feet, is equal to the amount of energy necessary to raise 550 pounds vertically one foot in height.

This amount of energy rendered in one second is termed a horse-power—that is, 550 foot-pounds rendered in one second, is the value of a horse power in mechanics.

The weight of a cubic foot of fresh water is estimated in practice at 62.5 pounds.

Ex. 118.—How many horse-power will 10 cubic feet of water, applied to an overshot water wheel, 40 feet diameter, render, the efficiency of the wheel being 75 per cent, and one foot being allowed for clearance?

$$\text{Cal.}—40-1=39 \text{ feet, effective head; } 62.5 \times 10 \times 39 \times .75 \div 550 = 33.24 \text{ horse-power.} \text{—Ans.}$$

TABLE 30.

Limiting Velocities in Open Streams.—Jackson's Hydraulic Manual.

	Feet per Second.
For the worst or most sandy soil.....	2.5
For sandy soil generally.....	2.75
For ordinary loam.....	3.
For firm gravel and hard soil.....	4.
For brick work, ashlar, or rubble in cement.....	5.5 to 7.5
For hard, sound, stratified rock.....	10.
For very hard homogeneous rock.....	14. or 15.
Limits usual for canals.....	1. to 4.
Limits for irrigating channels.....	1. to 3.
Limits for sewers and brick conduits.....	1. to 4.5
Limits for self-cleansing sewers and drainage pipes.....	2.5 to 4.5

Remark.—The importance of the data, given in Table 30, will be seen at a glance.

Thus, if a velocity exceeding 2.5 feet per second be given a stream in very sandy soil, destruction by erosion of the bed of the canal will ensue; while on the other hand, if the velocity shall not exceed one foot per second at first, the canal will be liable to become choked up by the growth of vegetation.

* This series of articles will shortly be published in book form by Dwyer & Co., Publishers of the MINING AND SCIENTIFIC PRESS, 252 Market St., S. F. Subscribers for the book will be filled in the order in which they are received.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

OIL STOVE.—Hedry L. Howse, assignor of one-half to Wm. H. Wiestler, S. F. No. 338,842. Dated March 30, 1886. This invention relates to certain improvements in oil stoves, with the object of making them more effective in operation and more convenient in use. The patent covers several improvements on a former device by the same inventor.

GATE.—M. B. Gordon and Wm. Y. Gordon, Davisville, Yolo county. No. 338,401. Dated March 23, 1886. This is one of that class of gates which are adapted to be operated by the passing traveler without putting him to the necessity of alighting from his vehicle. It consists of a combination of devices so as to provide a gate which is adapted to be readily opened and closed, and when closed to be securely fastened.

AUTOMATIC CABLE ROAD SWITCH.—Arthur F. Brown and Francis E. Stratton, S. F. No. 338,823. Dated March 30, 1886. This consists of a throw or switch-rail for the main and branch tracks, a movable throw-plate for the slots of said tracks, and mechanism operated by the approaching grip-car for operating the throw-rail and slot-plates. The object of this invention is to provide a means for switching the car automatically, thereby dispensing with the services of a man at the switch-point.

FAUCET.—David and Theodore Morris, S. F., assignors to Morris' Manufacturing Co. No. 338,353. Dated March 23, 1886. In the ordinary construction of faucets they are either made so that the valve must be opened and closed by hand, with the danger of flooding in case the valve is left open, or, if made self-closing, they are operated by a spring which is apt to get out of order. In this invention they use a balance valve so arranged that it shall have sufficient pressure to close itself when the operating lever is released, and is at the same time so nearly balanced that the valve may be easily opened under a heavy pressure.

BOAT ATTACHMENTS FOR VESSELS.—Pietro Micheletti, S. F. No. 338,859. Dated March 30, 1886. This invention consists of a buoy, or float, connected by a loosely paying line of suitable length with the ship or vessel, and seated loosely in a chamber or pocket, from which it can be floated by the action of the waters; and it further consists in details of construction relating to the construction of and attachments to the buoy, or float, and its connection with the vessel. The invention has various objects. The principal one is to indicate the fact that a vessel has sunk, and its location; another is to provide for the saving of life; and still another is to provide easy access to the sunken vessel and a means for getting ready appliances for raising her.

RECEPTACLE ATTACHMENT FOR DASH BOARDS.—Michael Fahey, Oakland. No. 338,833. Dated March 30, 1886. This is a bag or receptacle adapted to be readily attached to and detached from the dash-boards of vehicles. The bag is made of any suitable material and provided with a spring clamp flap on its back, adapted to fit over the top of the dash-board. The bag is stiffened by means of spring hars let into the material, and passing under the bottom, up the back, and into the clamp flap, where they unite with a crossbar, forming a spring frame for the clamp flap, flexible or pliable enough to allow it to fit over the dash-board and still to keep it sufficiently stiff for a good appearance. The interior of the bag may be divided into suitable compartments, and the partition walls are made of some elastic substance, as are the ends of the bag. The object of the invention is to provide a bag or receptacle for conveniently containing and carrying parcels, letters, etc., and which, by reason of its construction, is entirely out of the way, and yet perfectly secure in its position.

WINDMILL.—Syranus Standish, Pacheco, Contra Costa county. No. 338,799. Dated March 30, 1886. This invention relates to that class of windmills in which two vanes are employed to affect the necessary regulating of the wheel, one of said vanes being arranged in a vertical position, parallel with the wheel, and the other vane being mounted on a horizontal shaft and adapted to be oscillated by power transmitted from the vertical vane from a horizontal plane on which it lies inactive, to a vertical plane in which it receives the force of the wind and throws the wheel out of action. This invention consists in a novel arrangement of these two vanes and the power-transmitting devices between them. It consists, further, in a novel turn-table on which the wheel and vanes are arranged; in a novel and peculiarly-located bracket in which the turn-table is mounted and which is adapted to permit the most convenient arrangement of the pitman with respect to the tower employed, and on a novel hollow slotted stem, forming part of the reciprocating mechanism; said stem being the seat for the wire or cord which throws the mill out of action, and forming, also a novel connection with the pitman of the pump.

USEFUL INFORMATION.

Painting Tin Roofs.

A correspondent of the American Artisan writes: "I see in one of the recently published books on building, the direction not to paint a tin roof until it has been on at least thirty days. This delay was supposed to be necessary in order to have the tin washed clean, and so get rid of the grease, resin, etc. In the eastern part of the country any such delay results in giving the tin a slight coat of red rust. This, of course, makes the paint flow beautifully. Everybody likes it. But when the tin once gets started there seems to be no end to its rusting. It goes on all the same whether covered with paint or not. It is all very well for the tinman, but how is it for the man who pays the bills? What we want to do is to make the roofs last as long as possible with the least amount of repairs. Paper, tar, asphalt, iron and other kinds of roofing are coming into use largely because of poor tin roofs. It is for the interest of every tin man to put on as good a roof as possible and make it last. Now, to do this, rust must not be allowed to start. The roof ought to be painted before the plates begin to show red. Then the roof is safe, and if properly cared for there is no danger that it will give out before its time. I hold that such a roof, painted at proper intervals, will last forever."

Some persons seem to forget that there are two surfaces to a sheet of tin, says a correspondent of the *Tinner and House Furnisher*. They see the upper surface and take care of that, but forget that the under surface equally needs to be kept free from moisture. Water on the under side of a tin roof will produce rust about as quickly as water on the top surface. To prevent sweating and condensation of moisture on the under side of a tin roof is a point which must be guarded against by thorough ventilation, if we would make the roof last.

AN ELECTRICAL LETTER CARRIER.—An Eastern inventor is at work upon a plan for the transmission of letters and small parcels by electric tubes controlled and governed by electrical appliances. The tubes are to be made of brass and laid underground; through these the metallic carriers for letters or other business documents will be transmitted at convenient points. Compressed air will be admitted to move the carriers, and also the electric current, which is an essential adjunct to this system. The general plan of operation will be known as the consecutive, special and exchange systems, which will be adapted for transmission of mail between the postoffice and street letter boxes; packages of money, etc., between banks; papers, etc., from court rooms to lawyers' offices; packages from shops to customers' houses, and communications between police stations, etc. This plan differs materially from the mere pneumatic tube system. In the new arrangement of electrical devices and switches the carriers are sent from the main tube leading from the central point to the various branches with a great saving of expense in tubing. One line of tube will suffice for all stations, just as do the water mains.

LEAD PIPES IMBEDDED IN CEMENT.—Some of the peculiarities acquired by leaden pipes after having been imbedded for a period of five years in a layer of Portland cement, are described in the *Mettalarbeiter*. It appears that a red coating was noticed from one-twenty-fourth to one-eighth of an inch in thickness, the appearance of which corresponded with that of oxide of lead, as it is usually delivered in commerce. This coating was carefully removed, and the particles of lead removed with it were separated by means of a magnifying glass, and the specific gravity of this powder, carefully defined at 59 degrees F., and reduced for a vacuum, varied between 8.002 and 9.670. This variation is explained by the presence of the metallic lead, mixed in the oxide of lead, and carbonate of lead. Qualitative analysis demonstrated that this powder contained oxide of lead, lead, carbonic acid, water and traces of calcium. The formation of this peculiar coating on the lead pipe is believed to be owing to the action of the oxygen in the air, in union with that of the lime contained in the mortar.

WAX SPOTS ON CARPETS.—Wax can be taken out of carpets by several very simple methods. Lay a thick piece of blotting paper over the wax and apply a hot iron to it; the paper will absorb the wax that is melted by the heat. If, in doing this, any dark traces should remain on the carpet, rub a little benzoline carefully on, drying the same with a cloth; Another method is to drop a few drops of boiling water immediately on the spots and dry after with a cloth; care must be taken that the colors in the carpet will stand hot water. Green is the most dangerous color to fear.

ANCIENT LOCKS.—The general principles of a lock found among the ruins of the great temple of Karnak, and which was in use more than 40 centuries ago, have served as the foundation for most of the inventions of recent times. The locksmiths of China, we are told, had, centuries before the birth of Christ, perfected a lock out of which a sharp bamboo thorn would cut and

strike the hand of any one wrongfully tampering with it. The end of this bamboo thorn was steeped in a poisonous decoction, and, should the luckless thief escape death, he would be maimed for life. But this story is hardly entitled to full belief, for the reason, as the Chinese themselves claim, that as gunpowder was manufactured by them at the time, a Celestial safe holder could easily render the thorn lock harmless by the aid of a few grains of powder.

A VALUABLE DISCOVERY has been made, whereby the faded ink on old parchments may be so restored as to render the writing perfectly legible. The process consists in moistening the paper with water and passing over the lines in writing, a brush, which has been wet in a solution of sulphide of ammonia. The writing will immediately appear quite dark in color and this color, in the case of parchment, it will preserve. Records which were treated in this way in the German museum in Nuremberg 10 years ago are still in the same condition as immediately after the application of the process. On paper, however, the color gradually fades again; but it may be restored at pleasure by the application of the sulphide. The explanation of the action of this substance is very simple; the iron which enters into the composition of the ink is transformed by reaction into the black sulphide.—*Paper World*.

ART OF KNITTING STOCKINGS, ETC.—A new method has been devised for knitting and completing a stocking which is described as follows: Knit a toe and foot-heel to the line where the heel is to be joined to the main web, then take a previously knit heel-piece and running or picking a course of stitches thereof, taking one or more courses from the upper edge of the said heel-piece, upon a sufficient number of the needles of the knitting machine, still holding the stitches of the main web, then knitting the leg-heel, then cutting across the foot-heel just below the line where the heel-piece is joined to the main web, then joining by any suitable means the side edges of the heel-piece to the edge of the foot-heel cut from the main web and entirely closing the heel.

TO FIND THE SPEED OF A PISTON in feet per minute, when the length of stroke and the number of revolutions per minute are known: Multiply twice the length of stroke, in inches, by the number of revolutions per minute, and divide by 12. Example: An engine has a stroke of three inches, and makes 300 revolutions per minute. What is the piston speed? Twice the length of stroke is six inches. Multiplying by 300, and dividing by 12, we obtain 150 as the piston speed in feet per minute.

GOOD HEALTH.

Salicylic Lemonade.

As a "hospital beverage," says the *British and Colonial Druggist*, which has lately been found of great value in typhoid and other fevers, scurvy and gout, the following cannot be too widely known, it having been, we understand, first devised by a late medical officer attached to the Soudan expedition: Take 10 lemons; ½ ounce citric acid; 200 grains salicylic acid (salicylate of soda is undoubtedly meant), with white sugar and water to the taste. Squeeze the lemons, and put the juice aside; boil the fruit in half or three-quarters of a gallon of water for fifteen or twenty minutes; after standing for six hours take out the lemons, and again press them before throwing the exhausted pieces away. Add the juice and citric acid to the liquid, boil five minutes and strain. While hot add the salicylic acid, and stir until dissolved. Sweeten to taste with white sugar, and make up the bulk to one gallon with water.

Salicylic lemonade may be taken freely, either of the strength here given, or diluted with half its bulk of water. It should be freshly made every two or three days, unless it be permissible to "qualify" it by the addition of a little pure French brandy. If required to be in a "bright" condition, add, when cold, a little beaten up with white of egg. Boil for three minutes, and filter. If found too harsh for some tastes, dissolve in the boiling liquid, before straining, half an ounce of Nelson's patent opaque gelatine, previously swelled for five hours in cold water.

CAUSE OF STAMMERING.—Referring to stammering and its treatment, Mr. Edgar S. Werner, editor of the *Voice*, writes: A person may stammer with a full lung as well as with an empty one, and for the former to increase the quantity of air already inhaled would augment the difficulty. After many years of personal experience and the observation of scores of stammerers, I confidently assert that the quantity of air, be it large or small, in the lungs has little or nothing to do primarily with this affection. Using familiar terms, my theory is that stammering is an abnormal action of the laryngeal valves. The latest physiological authority shows that the larynx—the voice box—has two valves, namely, the one formed by the true vocal chords and the one formed by the false vocal chords, the closure of the former preventing the ingress of air, and the closure of the latter preventing the egress of air. Now, stammering is a conflict between or an antagonism of these two valves—all of the contortions, shortness of breath and various

other manifestations resulting therefrom. The only rational and effectual treatment of this speech defect, therefore, is to establish a harmonious action between these two valvular processes, together with correct diaphragmatic activity, whereby the proper tension of air takes place in the lungs, and the column of air reaching to and playing upon the vocal chords is rightly supported, and the supralaryngeal parts left free to mold, modulate, and articulate the voice which has been produced at the vocal chords.

Electrical Surgery.

A young man, 22 years of age, living at Burlington, Vermont, recently fell and injured his thigh. He suffered excruciating pain and soon lost the use of his leg. He went to New York for treatment by Dr. A. M. Roberts, who performed a remarkable operation which is described as follows:

The young man was put under the influence of ether, and Dr. Roberts, with a scalpel, laid bare a portion of the hip bone about three inches wide. Then he called into play a bone cutting machine, invented by himself and called the electro-osteotome. It is worked by an electric battery and can revolve surgical instruments 12,000 revolutions, if necessary, in a minute.

The doctor attached a small drill to the instrument and cut out portions of the hip bone up to its head, a distance of four inches. These pieces of bone under the microscope showed disease. The doctor then used still larger drills until there was a space large enough to admit the entrance of a man's finger. He now wanted to see the exact condition of affairs inside of the bone. To do so he used a novelty for this class of work—a tiny incandescent electric light, about as big as a pea. This Dr. Roberts introduced inside of the passage in the bone, and the several flashes of light enabled him to see just where the diseased bone was. Then he took up his drill again, and cut out the diseased bone wherever it was necessary as easily as if the bone were open before him on an operating table. Dr. Roberts put in a drainage tube to take off the diseased matter that might form, sewed up the wound, and applied antiseptic bandages. A hypodermic injection of morphine was given to the patient, and when he recovered from the effect of the ether he was in a satisfactory condition, and it is conjectured that he will in a comparatively short time be able to use his disabled limb.

Something to Live For.

It has been asserted by scientific surgeons that the will-power of a sick man has a great deal to do with his dying, and the case of Charles O'Connor is cited as evidence. A still stronger case occurred in Michigan the past summer. An old man living in the northern part of the State, got out a lot of timber many years ago for a toll-road company, but the company failed and left him in the lurch. For years and years he tried to sell the timber to this one or that, but no one wanted it, and at last time and decay rendered the heame almost worthless. Last summer the supervisors of that county advertised for proposals to build a bridge, and the old man put in a bid. While waiting to see what would be done he was taken very sick, and he grew worse so rapidly that a council of doctors was called. After due deliberation he was informed that he was approaching his end.

"When will I know about that bridge?" he coolly asked.

"The bids will be opened to-day."

"Well, I'll send John over to see who gets the job, and my living or dying will depend on his news."

At 5 o'clock in the afternoon the son and the family physician arrived in company. The old man was neither better nor worse.

"Well?" he asked, as John approached.

"Our bid was accepted, father."

"And we've got the job?"

"Yes; but the doctor says you can't live."

"I can't, eh? I'm not only going to live to build that bridge, but I'm going to work that square timber into it up to the last foot, or my name isn't John Rodgers!"

It is a fact, vouched for by a dozen good men that he was off that dying bed in a week, and in less than a fortnight was at work on the bridge.—*Devoit Free Press*.

COCOAINE AS A LOCAL ANÆSTHETIC IN FRACTURE.—Dr. J. R. Conway, Jr., reports in the *Medical Record* a case of fracture of the lower end of the radius reduced without pain after injection of cocaine. He says: "All attempts at examination of the fracture caused great agony, and I resolved to try if deep injections of cocaine at the point of fracture would sufficiently anesthetize the parts to allow of thorough examination and reduction of the deformity without causing pain. I proceeded to inject five minims of the four-per-cent solution into the inner, outer and posterior surfaces of the forearm, directly over the seat of fracture and as deep as the bone. In five minutes the fracture could be thoroughly examined and even roughly handled without the patient experiencing the slightest pain. After the examination I reduced the deformity by extreme extension of the wrist joint, together with traction, using considerable force, but without causing the patient any uncomfortable sensations."

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Butte.

LOVELOCK ITEMS.—Oroville Register, Apr. 7: The Black Channel filled with water and this necessitated putting in heavier machinery to pump it dry. The company have put in the needed machinery and they are now driving ahead at a good rate and working three shifts of men. The Pershaker mine is filling up as there has been an accident to one of the steam pumps. The Aurora is taking out fine pay dirt; the new hoisting machinery at this mine works splendidly and I consider it one of the best mines in the county. Prospecting is brisk about Magalia and everybody is looking for a mine, and new locations are being made daily. Some good strikes are being reported. A man named Brown who has been at work some time made a strike the other day, and it is thought that he has found an old channel. Wiley Bros., Collins and Dean are running a new bed-rock tunnel. So is the Golden Drift Co. and they will soon reach pay. Detroit Nooner & Co. are busy prospecting their ground, and you will soon hear of a big strike from them.

DEEP CHANNEL MINING.—Oroville Register, Apr. 10: There can be little doubt on the part of those who are most familiar with the subject that deep channel mining is destined to become of great importance in Butte, and the mines will exceed in richness any that were discovered along the Feather and its various tributaries in the pioneer days of the State. Along the Magalia ridge the deep channel mining is fast attracting attention and in a short time these mines will be found in other parts of the county. The vast flow of lava from Lassen, Butte and other volcanic peaks in Plumas county covered the old river channels in this county and turned the rivers aside from where they had been flowing for years. These old channels were far higher in gold than the newer ones and where a channel is struck beneath the lava it is almost certain to contain more or less gold. On the Mooretown ridge and on the Mountain House ridge these mines are bound to be found in a few years and then the mountains of this county will be more prosperous than in the days of '49 and '50.

Calaveras.

A PROMISING MINE.—Calaveras Chronicle, Apr. 10: The Riverside mine, in Hundred Ounce Gulch on the Amador side of the Mokelumne river, just north of this place, will make a big paying mine if it holds out as it promises. Messrs. Nuner and Lowry, the owners are confident of having struck upon the source of the rich placer ground in the gulch below, which was famous for its richness and the coarseness of the gold found in it, one nugget which was found weighing over one hundred ounces from which the gulch took the name of One Hundred Ounce Gulch. The character of the gold found in the ravine below led to the belief that a rich quartz lead must exist somewhere in the immediate neighborhood, but it was never found, there being no croppings to indicate its location. There is about two or three feet of soil to be removed before the lead is exposed, and in some places it is necessary to dig a foot or more below the surface of the ledge before any signs of quartz are found. Messrs. Nuner and Lowry have prospected the lead for a distance of four or five hundred feet finding rich quartz all along. Some of the specimens of rock are exceedingly rich, showing quite large pieces of gold clinging to the quartz. A piece of rock weighing about a pound was ascertained to contain in the neighborhood of \$20 of gold. Mr. Nuner states that he had been prospecting, off and on, for the past four years in that vicinity with the hope of finding a quartz lead there, but without success, until recently when Mr. Lowry, a prospector of long experience, joined Mr. Nuner in the search in which they were finally successful in discovering a hidden treasure.

Mariposa.

THE DILTZ MINE.—Gazette, April 10: The late rains have been exceedingly favorable for surface washing at this mine. The heavy embankments are fast yielding to the force of water, thereby exposing a vast amount of quartz, in layers from 3 to 20 inches in thickness. The late wash has exposed that part of the vein on the summit where Tom Early, a prior owner, took out 232 ounces of free gold, besides 250 tons of decomposed quartz which was ground at the Whitlock mill and paid \$32 a ton. The surface mining this winter has been subjected to two heavy land slides, which occasioned a great amount of dead work, but had necessarily to be worked off as it covered better ground. The best part of this mine is yet to be reached by means of a tunnel running from north to south on the line of the vein, on what is known as the spring level, and stopping up. This will have to be done with the building of a mill and other improvements, whenever the property falls into the hands of capitalists able to carry it on.

SAXON CREEK STRIKE.—Stanislaus News, Apr. 5: M. M. Rumley, of Mariposa county, for ten months past has been working a claim on Saxon creek, with but very little success, until last Saturday. Just six feet below the surface he struck it rich, and in a little time took out \$6,000. Later he took out \$3,000 more. Considerable excitement prevails in Mariposa over Mr. Rumley's lucky strike.

Nevada.

BAOGER MINE.—Grass Valley Union, April 8: The frame of the new hoisting works building for the Badger mine is up and nearly covered in. New sets of timbers have been put in the top of the shaft, and the work of setting up the pumping and hoisting gear will be commenced in a day or two more. The pipe for conveying water to the works is on the ground, and the ditch and tunnel through which the water is to be conveyed will be completed within ten days. Messrs. May & Walker, the contractors for putting up the works, think that in two weeks more they will about complete their job.

BOSTON MINE.—Grass Valley Union, April 13: The Boston mine, formerly known as the Granite Hill, on the east side of Wolf creek, and below Boston ravine, is showing up finely. The company now working it is composed of working miners, who took a bond upon the property last season, since which

time a substantial hoisting and pumping rig has been put up and the old shaft sunk down to a depth of 230 feet, where a level has been opened, which has been yielding excellent milling ore for some months. Recently the work of sinking for a new level was commenced, and it is now down 30 feet, and in six weeks more will reach the depth of 100 feet, when a new level will be opened. The ledge in the shaft shows a vein of solid quartz on the hanging wall, which averages eight inches in width, and between that and the foot wall are stringers, which promise to make into the main vein at a lower depth, and form a strong ledge. The ledge in the shaft and the stringers are rich in gold and fine sulphurets, and every carload of rock that is sent to the surface contains ore that is liberally sprinkled with gold, and the quartz itself is of that kindly character that miners regard as reliable in yielding good pay. As the ledge looks now in the shaft the new level is going to open up a splendid body of ore—better than that found in the 230 level, although all the rock now taken from that level is of high grade. The mine is worked by water power, having free water from Wolf creek, sufficient for any purpose, and the machinery used will work to the depth of 500 feet.

RICH.—North San Juan Times, April 10: The quartz vein struck at Buckeye Hill is something to boast of. Its owners are prospecting it thoroughly. Rock pounded in a mortar proves it to be rich. A. N. Crane, of this place, is one of the principal owners.

NORTH BLOOMFIELD.—There are no idle men in Bloomfield because of the running of the Derbec and the De Noon mine. The town looks neat and clean but is not growing very rapidly. The Derbec drift mine gives employment to about 100 men, 85 or 90 of whom work in the drift. We visited that mine Thursday last and witnessed a cleanup. We are forbidden to say anything of or concerning the same but a few bricks of the kind manufactured by Mr. Galovotti, the superintendent, would soon make a Croesus or a Vanderbilt of the owner. The Derbec mine is run very economically and is ably managed.

THE SUTRO TUNNEL.—Virginia Enterprise, Apr. 13: This famous concern is now in the hands of a receiver, the mortgage upon it, held by McCalmont Brothers & Co., London, amounting, together with interest, to \$1,500,000, having been foreclosed. The receipts of the tunnel from royalty on ore extracted from the Comstock amounts to over \$300,000 per year, which certainly is pretty good interest on the indebtedness. It is to be hoped that whoever may finally own and control the tunnel will have money, brains and ambitious judgment enough to push the tunnel further into the heart of old Mount Davidson and tap some of those numerous rich veins of gold and silver ore known to exist to the westward.

GOOD QUARTZ PROSPECT.—Transcript, April 7: There has of late been considerable excitement in the vicinity of Sweetland about a quartz ledge uncovered long ago by hydraulic mining operations at Buckeye Hill. A. N. Crane, the jeweler at North San Juan, and W. D. Campbell have made a location and are now sinking a shaft with most encouraging results. Charles Barton and many others have located extensions, the ledge being traceable for a distance of two or three miles, and new claims are being staked off daily. Deputy Assessor Brophy, who is our informant, is of the opinion that some good mines are likely to be found on the ledge.

MINING PROPERTY SOLD.—Transcript, April 3: The company known as the London and California Mines Limited, and of which Mr. Johns is the Pacific Coast agent, has sold the Erie quartz claim, near Graniteville, to George Mainhart, of Grass Valley, and the Pennsylvania claim, which is situated just at the northwestern edge of this city, to J. D. Thomas. The latter property contains about 96 acres.

Placer.

RELOCATION.—Placer Republican, April 7: The owners of the Big Oak Tree mine near Colfax, report that the mine continues to pay and is improving as it is developed. One day last week, however, they found on their hoisting works a notice of relocation posted by B. E. Valentine, the gentleman who owns, or represents the owners of the Rising Sun, the adjoining mine. It is claimed by Mr. Valentine that the ledge of the Big Oak Tree dips under the surface lines of the Rising Sun, and that therefore he is entitled to the gold. The Werry Bros. have retained counsel and will contest the claim.

MORNING STAR MINE.—Foothill Tidings, April 10: A lot of gravel specimens taken from the Morning Star mine, at Iowa Hill, Placer county. The gravel is a cement and is filled with coarse and heavy gold. The cement is what the miners call "lousy with gold." This gravel is 18 feet thick from the bed rock up, and the channel is about 100 feet wide. A tunnel, or breast has been run in on this gravel for 50 feet and it is all rich for this distance. The tunnel in to strike the gravel is 19,000 feet long, and it was too low and a raise of 60 feet had to be made. The gravel tunnelers generally get in too high. Getting in under the gravel is better than getting in above it.

Plumas.

QUINCY NOTES.—Greenville Bulletin, April 10: "Mrs. Grundy" informs us that the now celebrated Valentine ledge in Mohawk is likely to be sold to San Francisco capitalists. An expert has examined the property and on his return to the city telegraphed to two of the owners, who at once went down and have not yet returned. The Buckeye mine at Sawpit Flat is doing all that is claimed for it. It is reported to show from \$15 to \$25 a car right along.

San Luis Obispo.

CHROME MINING.—Tribune, April 9: William Albert and two other miners have for the past month been working in the Osos mine, seeking and taking out chrome ore. This mine is southwest of and in sight of this city, in the range of hills lying between Los Osos valley and the ocean. The mine is opened by a short tunnel, which started in on fair croppings, but these soon gave out and the miners continued into the hill. In about 100 feet they struck a ledge of very rich, black ore, about six feet in thickness and extending above and below the tunnel, containing an unknown quantity of ore. The miners work on a contract with R. E. Jack, agent of the Philadelphia Chemical Company, and receive \$2.50 for each ton they take out. Within the period they have been at work, about 30 days, they have taken out 100 tons, and are yet in bonanza. The

ore is hauled to Miles station, on the Pacific Coast railway, where it is worth \$8 per ton.

Shasta.

MACHINERY FOR THE MINES.—Anderson Enterprise, April 7: Last Wednesday two carloads of machinery for Sunny Hill and Bullychoop mining districts arrived in Anderson. The machinery destined for Sunny Hill is a complete five-stamp mill, for the Sharp Mining Company, owners of the Spencer mine. The machinery destined for Bullychoop mining district, is a ten ton Hill Triumph ore mill, with four Triumph concentrators. This mill is being taken up by H. B. Williamson, and the machinery for both mills is from San Francisco. The Hill mill will be constructed as a custom mill, to be erected on the Potts & Foster Eureka mill site, at the terminus of the Bullychoop toll road, and will be constructed and run for some time by Mr. Williamson.

SUNNY HILL.—A letter received from Sunny Hill informs us that times up there are quite lively. Mr. Loomis is crowding work ahead on the Spencer lead, and is taking out lots of rich rock. "Big Charley" has sold his mine to Enright for \$12,000. Tim Quinn is meeting with good success in his mine lately purchased of Davis & Smith. Considerable prospecting is being done, and the general affairs of the district are very encouraging. Next month C. K. Parson's stage line will be extended to Sunny Hill, and also to Bullychoop.

IRON MOUNTAIN.—Shasta Co. Democrat, April 8: About half the force at Iron Mountain has been discharged. All but five stamps of the mill shut down and Superintendent Ellsworth deposed. All this has come to pass because the company discovered, after working nearly 800 tons of ore, that the ore was not being treated right. It seems that the process adopted by Ellsworth is a failure, as many mining men predicted. The temporary failure is not the fault of the mine. The ore is there in quantities but the proper plant was not put up to save the mineral. The company are now experimenting to find out if possible what machinery is required and what process is best adapted for successfully handling the ore. There is too much money already invested, and too much good ore in sight in the Lost Confidence to let the enterprise go to the ground now. But the strangest thing of all is that the company did not know how to treat the ore in the first place. Tom Green's five-stamp mill arrived last week. Low-grade lead carbonate ores are found on Cow Creek. Several stockholders in the Iron Mountain mine came up on the train last evening. We are informed that a new superintendent is in charge of the Iron Mountain mine. The Croesus Mining Company blew their steam whistle for the first time last Monday. Ed. Burke, of the Portuguese Flat hydraulic mine, was in town Monday, but we didn't have a chance to interview him. The Brown Bear Mining Company of Deadwood have ordered five more stamps which the company will add to their mill, making 15 stamps in all. Mr. C. C. Jones, who superintended the Winthrop mine at Copper City last fall, wrote to L. E. Bainey a few days ago to the effect that he had bonded the Billy Hill, Popejoy and Jennie June mines in Copper City district, and will associate some Eastern capitalists who will try to work those mines by concentrating the ore, and from the concentration extract the metal. Mr. Jones has recently worked a ton of this ore in San Francisco in this way and feels confident the same process will be successful on a large scale. Mr. Jones' letter is very encouraging and predicts ultimate success for Copper City.

Sierra.

STRIKE IN THE SAN LUIS.—Tribune, April 9: The San Luis Consolidated Company has tapped the ledge in the tunnel at a depth of 200 feet from the surface and cut through it to the foot-wall. The ledge is between four and five feet wide, and prospects well—much better than the owners expected it would at this point. This mine is situated at the head of Avalanche ravine, about three miles southwest of Sierra city, and is considered a valuable property. There is every facility for working the mine. The ledge can be tapped nearly 700 feet from the surface by running a tunnel about 400 feet. The company will run east on the course of the vein and it is expected to open up a large body of good milling ore. The owners have still another ledge on their location which is supposed to be very rich, and which was worked some twenty years ago by Mexicans. A tunnel will at once be run to tap this ledge 200 feet below the old workings.

Siskiyou.

NOT WATER ENOUGH.—Yreka Union, Apr. 10: The big ditch is not well supplied with water as reported which is one of the causes of the suspension of work in several of the mines on Yreka flats. Louis Scheld, who has been using forty inches from the ditch is cleaning up in his mine, as he cannot work to advantage with a lesser quantity, and the lessees of the ditch were anxious to reduce the supply.

Tuolumne.

MINE SOLD.—Union Democrat, April 10: The Jumper mine, situated on the mother lode below Quartz Mountain, located and operated successfully for some time by the Fitzgerald brothers is about to be sold to Mr. Fisher, who bonded the mine some time ago. Mr. Fisher is satisfied with the mine and the price asked, \$9000, and the sale will be consummated upon the arrival of the money, which was looked for yesterday.

NUGGET.—Johnny Gaynor, nephew of Peter Kelley, was driving the cow Monday on Stockton street, when near the creek his sharp eyes saw something yellow. He picked it up and found it to be a pure gold nugget that weighed 32. It has a familiar look to those who saw what the miners took out in that locality in early days.

Trinity.

NEW MILL COMING.—Trinity Journal, April 10: From Mr. Gupta, of Indian creek, we learn that a contract has been let for the building of a wagon road from the end of the Cottonwood road to the Pound Cake mill-site on Bullychoop, to enable the latter company to get in a new mill. Much work will be done at Bullychoop this summer and we anticipate good reports from this district.

NEVADA.

Washoe District.

HALE AND NORCROSS.—Enterprise, April 10: On the 2900 the main north lateral drift has been con-

ducted with more directly from the station, and carried forward by a turn to the west in order to avoid the west seam previously encountered, and it is being run to intersect the good body of ore found in that direction some months ago. Explorations from the upraise winze between the 3000 and 2900 are discontinued at present, but stopping in the fine ore deposit found in upraising above the 3100 level are still going ahead, the ore from the explorations being carefully stored away in the drifts and crosscuts until hoisting can be done to advantage through the Combination shaft. Drifting laterally from the bottom station of the deep winze, at the 3200 level, will be commenced shortly. Superintendents Patton, Osbiston and Lyman, who have recently inspected this fine ore development above the 3100 level, speak very highly of it as the best prospect yet found at that depth.

GOULD AND CURRY.—On the 600 level the main south lateral drift gained 45 feet during the week, its face being turned east of south in new ground. The material is principally quartz of a low-grade ore character. The crosscut west on this level gained 32 feet, and is running in vein porphyry. Rule's anticipated bonanza is supposed to be not far away.

POTOSI.—The main lateral drift south, or rather east of south on the 3100 level has made over 11 feet per day during the past week, the ground being of a very favorable nature. It is dry but easy working, and the face of the drift has nearly reached the middle of the Potosi ground, which is 700 feet in lateral length.

CON. CALIFORNIA AND VIRGINIA.—During the week the daily yield has been a little less than 400 tons averaging about 516 per ton, from battery samples. The explorations southwest on the 1400 level and those to the west on the 1650 level are progressing energetically and well.

MEXICAN.—The west crosscut on the 500 level is in 123 feet, showing no features of interest to report. On the 700 level the joint Mexican and Union drift running northwest from the Ophir shaft is 609 feet in length, 33 feet having been added during the week.

CHOLLAR.—Nothing doing in this mine beyond the promoting of the transportation of waste through it from the main lateral drift south in Potosi ground. No order as yet received to crosscut the ore vein or to resume sinking the Combination shaft.

BEST AND BELCHER.—The water has been lowered in the shaft during the week 29 feet. The pumps are doing good effective work, but owing to the great extent of country to be drained, the receding of the water in the shaft is comparatively slow.

SIERRA NEVADA.—The crosscut west on the 520 level was advanced 29 feet during the week, making a total length of 326 feet. Material, dry porphyry and quartzite, exceedingly hard and working unfavorably.

OPHIR.—The explorations on the 300 and 400 levels show no improvement over last week. Good work is being done, but thus far streaks and bunches of low grade ore only have been met with.

YELLOW JACKET.—About 130 tons per day continues to be the average from the old workings above the 1300 level. The old ore stopes hold out well, but the ore generally is of rather low grade.

CROWN POINT AND BELCHER.—Daily yield about 375 tons. A considerable portion of this comes from the 1600 and 1700 levels, and is better grade than that from the old upper workings.

MONTE CRISTO.—No ore is being extracted from the old mine at present, work being confined to running the drifts west on the 50 and 150 levels from the new shaft.

UNION CONSOLIDATED.—On the 500 level north lateral drift No. 2 is in 355 feet, 36 feet having been added during the week. Material, vein porphyry, dry and hard.

ALTA.—On the 700 level the main lateral drift north has reached the Benton line, and next in order will be to crosscut west through the ore vein.

KENTUCK.—Daily yield about 50 tons from the old upper workings, keeping the Rock Point mill supplied.

Columbus District.

HOLMES.—Candelaria True Flissure, Apr. 10: In the 8th level we are stoping in the Morris ledge. This stop is still 170 feet long and is large and strong. This stop looks just the same as it has for a long time. The ore body that is parallel to the last mentioned ore body looks well. It runs in a northwest course from main 8th for a short distance and then turns west. It may possibly come into the main 8th stop when we get far enough west. In the western end of the main 8th we have connected with a winze that was sunk by the General Thomas Company when they were working this ground. The gypsum ore body is still producing and we are getting some good ore from here. A portion of the ore that comes from this point is sulphurets ore and high grade. In the drift from raise in eastern end of 9th level we now have a good body of ore. We have drifted 50 feet in this ore body. It started from raise in a northwest course. It has turned to a west course and now runs almost due west. We started the drift off on this ore body at a level with the old 8th level. The face of 8th level is 200 feet west of top of raise from 9th. We have started work in the east face of 8th, and will run it in and connect it with this ore body. We have started a raise in the 9th level about 100 feet west of 9th raise on a streak of high grade ore that we think will connect with the ore body in the drift at the top of 9th raise. The ore that comes from the drift is a good one. It is nice yellow chloride ore and will average \$100 per ton.

MOUNT DIABLO.—On the 6th level the east drift is in 421 feet and the north crosscut from the west drift 225 feet. The stop between the 5th and 6th levels is giving some \$60 ore. The intermediate drift between the 4th and 5th levels shows eight inches of \$70 ore. We are getting some ore of fair grade above the west drift on the 4th level. The stop above the east drift on the 3d level is giving a little ore of fair grade. The east drift on the 2d level is yielding some ore of good grade. We are taking high grade ore from small streaks above the west drift on this level.

Eureka District.

ORE SHIPMENTS.—Eureka Sentinel, April 10: The following shipments of ores have been made (Continued on page 265.)

The Selby Smelting and Lead Company.

Ore Buying, Ore Reducing and Bullion Refining.

A representative of the PRESS paid a visit a few days since to the new works of the Selby Smelting and Lead Company, near Vallejo Junction, on the line of the transcontinental railroads. The new plant of this company is very extensive and much more complete in its appointments than the old one which they have had for many years at North Beach in this city. The business of this company was first established as far back as 1865, for the working of base metal ores and bullion and the manufacture of their products.

The New Works.

The volume of business gradually increased so as to outgrow the facilities of the works at North Beach, and it was determined to seek a new location. A point on the bay shore was selected near Vallejo Junction, Contra Costa county, and the land and water frontage secured. Gangs of men were set at work filling in the water lots and leveling the ground for the establishment. There are 43 acres in the whole plot, and the three franchises give them 3450 feet of water frontage. The works themselves cover an area of about six acres, and there is abundance of dumping room for waste, so that the available area is constantly being extended. At the front of the works is deep water, and wharves have been built so that ships of any size can be docked, and their cargoes of coal, etc., deposited in the yards close to the smelters. At the rear of the works is the overland railroad track, and side tracks and switches have been put in, so that ores, etc., may be readily handled. The company owns its own steamer, which plies between the works and San Francisco, bringing up supplies and taking the products to market, when not to be shipped by rail.

When the plant was moved to its new location, the old engines, furnaces, etc., from the old works were brought up, but a great many new things have been added, making the plant the most extensive on the Pacific Coast.

The Different Departments.

In the engine room, which is quite commodious, and has a solid asphalt floor, is the main engine for running the machinery of the works; Burleigh air compressors for supplying air to run the various small engines throughout the works, including the Chamberlin cartridge machinery; the hydraulic accumulator by which the various elevators are operated; Baker blowers for the blast furnaces; the dynamo for furnishing electricity for the electric lights by which the works are lighted at night, etc. The hoiler capacity is 300 horse-power. There are six boilers, two of them being spare ones. A fine Llewellyn heater is also provided.

Back of the engine room is the ore sampling room, where there are rock breakers, crushers and pulverizing machinery necessary to carry on the work in this department.

The blast furnace division is at the extreme western end of the works; a long brick line connects the furnaces with the large stack, which is 100 feet high. Ample room is provided for the erection of additional furnaces as required.

In the next large division of the works are the numerous reverberatory furnaces for smelting ore or the by-products. Next to this is the roasting room, where the sulphurets ores are roasted and the ore freed from sulphur, arsenic, etc.

A large space in the works is devoted to the manufacture of blue-stone, which is one of the products they have been making for some 12 years past. They now make and sell from 800 to 1000 tons a year. With the exception of the Dayton works, this is the only place on the coast where blue-stone is made. Some cement copper is purchased for use in this department, though at present they have enough copper from their own products for all purposes, a copper matte being formed from the ores.

In the silver room are the appliances for refining gold and silver, including large and well-arranged vats for precipitating silver by means of copper. The sulphuric acid process is here used in the separation of gold and silver; the latter is precipitated with copper and the resulting copper is afterwards utilized in the manufacture of blue-stone. As hereafter stated, the company purchase gold and silver bars, and also receive Dore bars and refine them.

The lead bullion department is an interesting portion of the works. The bullion is received from the Eureka mines, Iroy, Benson and all other places where lead smelting is carried on. The Selby works receive this bullion and refine it. The cupel furnaces, retort furnaces, and all the usual appliances for refining base bullion are well and conveniently arranged. The refined bars with the stamp of the works, are piled up in the spacious yard, ready for shipment.

A Well Arranged Plant.

The arrangement of the whole works has been made in the light of extended experience, the various departments being placed in the relation to each other which provides for the greatest convenience, and causes the least handling of material. Steel railroad tracks extend in every direction throughout the works, and turn-tables are placed at all corners, so that the iron hand cars are readily moved to and from all points. In fact there are two stories of these tracks. The buildings are quite high and there is a double system of tracks, one above the other, the cars being raised to the upper system by hydraulic elevators placed at suitable points. By these means a great deal of labor and time is saved. There are about 170 men employed, the works running day and night (excepting Sundays), with two shifts of men.

On one of the hills back of the works is a large reservoir for supplying fresh water. Near by are several cottages—the beginning of a village—where the workmen live. The boarding houses for the men are across the track from the works and are neatly kept, commodious and clean.

One of the most attractive portions of these immense works is the assaying department, consisting of four well-lighted, large and airy rooms. There are the reducing and muffles furnaces, sand baths, etc., and all the usual appliances. One room is set aside for weighing where there are several of the finest assay balances. There is a great deal of work done in this department, several assayers being employed. The various lots of ore, bullion, etc., are here tested, and the facilities are very complete.

In all the main departments or rooms the floors are of solid asphalt so that they can be kept clean and dry. The buildings are high-shedded, so there is plenty of light and air, and arrangements are made for preventing the accumulation of dust or debris of any kind.

Throughout the works are many evidences of the practical knowledge and experience of the accomplished superintendent, Mr. Prentiss Selby, under whose personal supervision the new plant has been arranged. Many of the devices are of original design, especially in the assaying, refining and furnace departments. A noticeable improvement is the "water-jacket door" used in the reverberatory and roasting furnace. To the inner portion of the metal plate forming the door is secured a receptacle through which a stream of cold water is constantly flowing, so that no matter how great a heat there may be, the door can be readily handled. The pipes and hose connecting with this can be arranged as to take the weight of the door, so that it can easily be moved aside or replaced with no difficulty either from weight or heat.

An important adjunct to the new works is that of the manufacture of

Breech-Loading Shotgun Ammunition.

At the extreme north end of the plot of ground a fine two-story building has been erected especially devoted to the making of breech-loading shotgun ammunition. This is done by machinery, the Chamberlin automatic cartridge loader being used. There are seven of these machines, making the capacity about 100,000 cartridges per day. The machines are run by a compressed air engine. In the same building are the packing and storage departments. Shotgun shells of the same interior capacity, when loaded by hand, are found to vary in their finished lengths, which is, of course, evidence that the wads are not level, or that the quantity of powder or shot varies, so that constant pressure is not used in ramming the charges. Unequal results must necessarily follow, much to the annoyance of shooters. The measurement of powder and shot in the usual way varies more or less. Shaking by hand does not always level the charge to even the wads squarely on the surface. It is impossible to always put the wad down perfectly in

the shell by hand. Many trust to the rammer to level it as it goes down, which the rammer fails to do, and a weak-shooting cartridge is the result. Then, the degree of pressure upon the wads varies, it being found impossible to secure uniformity of hand pressure in this respect. Careful examination of a hand-loaded cartridge will reveal its defects.

The Chamberlin Cartridge Machine.

The Selby Company have purchased the right for this coast to use the Chamberlin machine, and since commencing the manufacture of these cartridges have built up an extended and growing trade. The defects of hand-loaded cartridges are all remedied by the Chamberlin machine, which insures the sportsman perfect accuracy in the load, and will also save him much time and trouble. The machine-made cartridges are placed on the market under the brand of "Standard Chamberlin." Of course, all sizes are made, and for any kind of shooting. Each cartridge is perfect, since the machine automatically assort and tests each shell.

This machine is one of the marvels pertaining to the development of the science of modern gunnery. It is so constructed as to perform all the operations of loading shells with absolute accuracy, giving uniform charges of powder and shot and uniform pressure upon the wads, and with any desired number of wads. Each wad is inserted in the shell separately, with such pressure upon it as may be wished, and forced home in an absolutely level position, an advantage that cannot be secured in the hand-loaded article. The rammers are graduated and adjustable to any desired pressure up to 100 pounds, so as to obtain the highest explosive force without crushing the powder.

The empty shells are placed in a guide, and as the machine is revolved, they drop one after another into a small receptacle formed to catch them, and each shell becomes part of the mechanism for the time being. As the shell drops into the little pocket, with the open end up, the powder from the glass receptacle, shown in front and on top of the machine, drops into the charge shown below it, and the fixed charger into the cartridge from said charger. This charge of powder is accurately measured and is subject to gradation. It goes into the shell, to which a jar or shock is imparted, so as to level the powder smooth on top.

As the machine revolves, the powder-loaded cartridge next comes under a plunger which forces down a pasteboard wad upon it. The wad is tapped or tamped by a slight blow. The next plunger forces down a pink-edge wad upon the pasteboard; which is followed in turn at the next plunger by another pasteboard wad. Then the cartridge comes under a spout from which the charge of shot comes, and, as it goes round, another pasteboard wad comes on top of that. All these wads are sent uniformly and evenly, and there is an even pressure on each, something that cannot be accomplished by hand. When the last wad is in, the cartridge is reamed smoothly, a stamp marks the number in the end, and the completed cartridge drops into the box ready for packing. Mr. Selby has materially improved the means for feeding the wads, and has also improved the reaming or crimping attachment, so that the edge is smooth and never broken or ragged. Standard varieties of these cartridges are made to be kept as stock, and special lots are loaded to suit individual requirements when ordered. The uniformity in loading is of the highest importance, and only the very best material is used. The desire of the company is to make their loaded shells that their standard character will be recognized by shooters, who will always be able to get the same quality at all times.

In addition to the works at Vallejo Junction, the company have a shot-tower in this city, where all sizes of shot are made for the Pacific Coast market. At the same place they also manufacture sheet lead, lead pipe, etc.

At the office in this city, 416 Montgomery street, there is a department for the purchase of gold and silver bullion.

Purchasing and Working Ores and Sulphurets.

From what we have said, it will be seen that at these works every facility has been provided for working gold, silver and lead ores. The company is prepared to purchase and pay the value of the gold, silver and lead in the ore, based on the New York prices for the silver and lead, and the actual value of the gold.

From these values is deducted the amount of ordinary losses in working and the regular charge for the beneficiation. These ores are paid for usually after they are sampled and assayed, and the check or money forwarded or paid to any individual or bank the owners may designate. In every case, after the sampling and assaying, the ore is kept until the parties who own it are heard from to know that the sampling and assaying are satisfactory. In this way all parties are protected, and if any one has overrated the value of the ore and is dissatisfied the sale need not be made.

With the increased facilities of the new plant, the company is now prepared to purchase ore in large or small lots. Miners will do well to bear this in mind, for these facilities have not always been available. The company is an old-established one of most excellent reputation, and prospectors and miners may feel sure of fair and honest treatment in every way.

There are many mines on this coast, the ore of which carries more or less sulphurets. In years past the sulphurets were allowed to run to waste, but where there is any considerable percentage, they are now concentrated and saved. Of course if mines have their own chlorination works the sulphurets may be worked at home; but chlorination works are not numerous. The Selby company have all the necessary appliances for working sulphurets, and are able to do it to a good, high percentage of assay value. Moreover they return the silver as well as the gold contents—something not done by the chlorination works. Miners need no longer pile up their sulphurets, but can ship them and have them worked at moderate charge by this company.

Gold and Silver Bullion Refining.

In 1879 this company extended its operations and purchased the refining and assaying business established by Kellogg, Heuston & Co., in 1851; continued by the San Francisco Assaying and Refining Works, and afterwards by the Pacific Refining and Bullion Exchange.

The gold and silver department of the works is a very important one. Gold and silver may be deposited for refining and the charges for this will be the same as in the Mint. The returns for gold bullion will be made within 24 hours; on the silver bullion in from 10 to 14 days. The payments of silver can be made in fine bars and in a shape to be sold in the open market.

This is the only private refinery on the Pacific Coast where miners and dealers in gold bullion throughout the country can make their shipments by Wells, Fargo & Co., and receive their returns within 24 hours after being received by the Selby Co. After being received the proceeds are payable in gold coin, or by check, as shippers may direct.

This being a private institution, they are enabled to afford every accommodation to depositors in the way of making returns. For the protection of the depositor assay samples of every deposit are kept for six months, so that at any time parties who are dissatisfied from any course may have re-assays made in order to satisfy themselves entirely.

The arrangements of the new works are such that the facilities can gradually be extended as demanded. Since the removal it has been found that the business has already materially enlarged. The company is desirous of increasing its ore-buying department, and to this end every facility will be given to miners owning lots of ore which they may want worked.

The main office of the company is at 416 Montgomery St., San Francisco, where all correspondence should be addressed. The officers of the company are: A. J. Ralston, president; H. B. Underhill, Jr., secretary; and Prentiss Selby, superintendent.

MANGANESE.—Consul Guerson at Coquimbo, Chili, sends to the State Department a remarkable report in regard to the mining and shipment of manganese from that country. He says the ore lies in ridges on the mountains near that port, and thus far has been mined simply with crowbars. There seems to be no end to the amount that can be obtained. The only expense attending it is hauling it to the port. The first cargo ever sent away from the country was in September last. Since then about 6,000 tons have been shipped.

THE Big Bend Tunnel is completed. The dams are not yet constructed and it will be sometime before the river is turned through.

Mineral and Metalliferous Veins.

The New Hypothesis Verue the Old.—No. 3.

EDITORS PRESS:—Presuming that our philosophizing on this subject may be of interest—to some of your readers—we venture a little farther on the new trail. Supposing our views to be correct or nearly so, it may be found that as “like attracts like” so quartz would attract quartz and ore attract ore. So also would silicon unite with some constituents of ore in equivalent proportions, providing it had not already united with other elements for which it had as great, or greater affinity. Hence we might

Divide Veins Into Three Classes.

First, true ore veins; second, true quartz veins, and third, mongrel ore veins. The first consisting chiefly of ores, the second purely of quartz, and the third being an intermediate class.

Supposing nature has formed a true quartz vein in the crust of the young and growing world, and subsequently a shower of chaotic matter containing metals is precipitated approximate to it; they may exist in such a chemical state or compound as to possess no affinity for the existing quartz vein, therefore their own innates forces draw them together to form veins of their own peculiar character, uniting only with as much silicon as they have an affinity for. Then at a still later period, other showers of matter continue to fall, and are washed to and fro across the veins, each vein would attract elements or compounds of its own character, until some metals fell which were free to unite with elements in the quartz vein, and found a resting place in what was formerly a true quartz vein; but now becomes a mongrel ore vein. The quantity of ore thus deposited, though small at first, might continue to increase, but could never surpass the richness of a true ore vein.

Decompositions of silicon compounds would also deposit

Silica in Ore Veins.

To illustrate such decompositions and recompositions, suppose a wave of fluid matter containing chloride of silicon (under heavy atmospheric pressure), flowing over a silver vein, would not the chlorine find a stronger affinity for the silver, and unite with it to form chloride of silver (horn silver), while the silicon set free would rapidly unite with the oxygen to form quartz? In this manner innumerable changes may have taken place, the result of which would be the deposition of silica or other gangue in a vein. But hasty nature ceases not here, and the ores eliminated from the gangue by such actions, moves steadily on towards the strongest centers which seem to have grown under this influence, until their increased dimensions sometimes burst the very rocks, as a growing plant does the soil.

Reasoning From This Standpoint.

The more quartz is found in a true ore vein, the richer and larger will be the pay streaks; but it must be borne in mind the elements of ores are vastly different and unite with silicon in a variety of quantities, so also are their powers variable to eliminate silicon from other compounds, that it might be free to form silica with oxygen and at once become a fixture in the vein. Hence, one character of ore would carry a large accompaniment of quartz, while a different kind carries very little. Thus, the character of ore may determine the proportional quantity of quartz in a vein and the quantity of quartz or gangue with ore of a certain character would also determine the quantity of ore.

Still Another Influence

Should be considered; if “like attracts like” it is more than likely that after changes had taken place, resulting in a deposit of barren quartz, it too would continue to build up with matter of its own class, its extent being determined by the character of the country rock in which it existed.

Why approximate veins do not dip at the same angle may be due to the tendency of some mineral compounds to become solidified more rapidly than others, and thus resist the force of waves of matter which would tend to wash the precipitating vein stuffs onward in their course.

My very superficial knowledge of chemistry does not justify me in asserting that chlorine has a greater affinity for silver than for silicon, nor have I access to any work that will enlighten me on the subject, but the illustration drawn above serves to convey the idea how silicon can be eliminated from certain compounds by certain elements existing in veins, hence a recomposition with oxygen, as stated.

Since writing the above article I have received the PRESS of March 6th, containing Mr. Blackburn's second letter on this subject, and must say his criticisms call to mind the words of the poet:

“The man is thought a knave or fool,
Or bigot plotting crime,
Who, for the advancement of his race,
Is wiser than his time.”

Mr. Blackburn evidently considers himself a progressive man, and yet those who view matters in a different light from his own, have not “an atom of reason in their composition.” Now if Mr. Blackburn is a scientific truth should remember that the most pro-

found topics that ever engaged the human mind have found “intellectual giants” on both sides. And though I do not consider myself a philosopher or intellectual giant, yet I would be sorry to admit that I do not possess “an atom of reason in my composition.”

While this gentleman holds our “little tints,” our “new discovery,” up, in derision, and makes the broad assertion, without proving it, that, “there is no analogy, and there is no use to discuss the subject as stated,” yet he finds analogy between the “formation of rock candy and that of crystallized quartz.” Yes, even more, he illustrates his theory by “a drop of ocean water in the field of a microscope” and “it is all under and according to the same law.”

What profound philosophy! that such should be the case, and that the same law that governs chemical action on a metal plate should have no effect on a large scale in nature.

Now Mr. Editor your readers are well aware that science has frequent recourse to

Artificial Means of Illustrating

Nature's works and though our “little tin type plate” was an accidental discovery, we consider it none the less a beautiful illustration of the formation of metalliferous veins.

Although Mr. Blackburn has found that the metals are deposited in a small quantity by hot water solutions, it does not necessarily follow that all our very large bodies of rich ores were thus formed. In our first letter on this subject we admitted a statement of Vonnegott's that “No one theory will apply to all mineral deposits” and though “hastard” veins may be formed by percolating waters, we still cling to the opinion that the richer deposits were formed in the manner we have described.

By examining our “little tintype plate” under a glass you will observe that the clear black portions which show no silver to the naked eye, are covered with minute particles of it; probably every atom of this would find its way to the veins unless counteracting forces prevent its doing so.

Thus in nature there must often exist atoms of the metals dispersed through the rocks; all of which are moving steadily on to the greatest centers of attraction. A St. Louis correspondent of the Chicago Mining Review, clothes this idea in the following beautiful language:

“Galvanic forces reached afar,
These threads they run from star to star,
This sympathy of Mother Earth,
Has been with her from time of birth.”

In the PRESS of January 9th, page 27, in the “Good Health” column, is a short article entitled “A New Method of Introducing Medicine into the System,” which is done by means of electricity, and which supports our theory very definitely, and transforms Mr. Blackburn's reference to the mines in Arizona into a very strong argument in our favor. Water being a powerful conductor of electricity, the atoms of metals were borne along on the constantly flowing magnetic currents in the direction of the heaviest deposits, but coming in contact with the timbers which were non-conductors of electricity their passage was impeded and they found a resting place in the surface of the wood and were not deposited by evaporation. We have heard old miners say the aniferous sands of the Ssacchawan can be worked over year after year with the same results. They believe the gold is being continually washed down from the sources of the stream and the tailings are thus replenished. We believe on the above principle that the atoms are being united into dust heavy enough to be saved in the sluicelox.

All Veins are not Faults

In the formation as we can prove to Mr. Blackburn by the Luella mine in Soap gulch, Silverbow county, M. T., as it not only shows no displacement of the rocks, but at a depth of about 65 feet the vein is definitely cut off by a strata of micaceous rock about two feet thick, which no theory can explain, but that which we have advanced. When the vein was being formed a shower of matter fell which contained no metals, consequently the vein was “capped” over, but when subsequent showers fell containing metals they were attracted by the force below and continued the building up of the vein. The Colonel Robert G. Ingersoll mine that we are prospecting at present shows a fault very definitely, the hanging wall being elevated two feet above its primitive position, but we do not consider it adverse to our theory as it is reasonable to suppose an earthquake would break the ground in the direction of the least resistance and a fault would only prove that a vein extended down to great depth.

Before closing this article it may be well to state that “the known compounds of silicon are not numerous,” those mentioned in Silman's Chemistry are with oxygen, chlorine, bromine, fluorine, and sulphur.

The first, silicic acid (silica) is a solid with which prospectors are acquainted in the form of “rock crystals, agate, common uncrystallized quartz, siliceous sand, etc.” The second and third, chloride of silicon, and bromide of silicon are liquids denser than water. The fourth, fluoride of silicon is a dense, colorless gas. The fifth, sulphuretted silicon is a white, earthy compound. It is decomposed by water into silica and sulphuretted hydrogen.

On these compounds we base our theory how silica becomes associated with the ores, as set forth in the first part of this article.

We close with the wish that whether we be right or wrong, “truth may prevail.”
Glendale, M. T. HENRY W. BROWN.

About Obtaining Patents.

Patents are Virtually Contracts

Between inventors and the public. The consideration flowing from both parties to the contract is expressly fixed by statute. The Government requires the following consideration in every case: First, that an applicant for a patent shall disclose a new and useful improvement, of which he is the first and original inventor. Second, that the invention has not been patented, or published in a printed publication prior to the date of his invention. Third, that the invention has not been in public use, or on sale, more than two years prior to his application for a patent. Fourth, that the invention shall be properly described and claimed in the specification forming a part of the patent. Provided an inventor complies strictly with these conditions, the Government guarantees that the inventor shall have the exclusive right to make, use and sell the thing invented for the term of seventeen years.

The Patent Law provides that in case a patent, which is the evidence of the contract, is not executed in compliance with the requirements of the law, it may be annulled and rendered void. Hence, it is of the greatest importance to every inventor that his patent or contract be skillfully and accurately drafted, that it may afford him complete protection for his invention during the life of his patent.

Secure a Good Patent.

An inventor should first ascertain whether or not his improvement has been patented to another. This requires an exhaustive search among all the patents in the class to which the invention relates. This question can often be answered gratuitously by us, immediately on receiving full information of the invention, by reason of our long and extensive practice as patent solicitors and editors and publishers of first-class, scientific and industrial journals, during the past 20 years and over. When the question of priority of invention is not so readily to be determined, it is generally best to make what is termed a “preliminary examination,” by searching through the patent office reports among the patents in the class to which the invention relates, and referring to our extensive patent library, containing compilations of special classes of American and foreign inventions, mechanical dictionaries, scientific encyclopedias, files of scientific and mechanical newspapers, and an immense number of patent applications by inventors of the Pacific coast, carefully filed by this office since 1860.

If, by this “preliminary examination,” the improvement is found to have been previously invented, our client will receive, for the small sum of \$5 for the examination, a verbal or written report showing definitely whereby his invention has been anticipated, thereby saving him further expense and perhaps much time, useless delay, anxiety, etc.

To avoid all unnecessary delay, however, in securing patents at the earliest moment practicable, inventors will do well to forward a model, drawing or sketch, with a plain, full and comprehensive description of their invention (stating distinctly what the particular points of improvement are), with \$15 as a first installment of fees. If the improvement appears to us to be novel and patentable, the necessary papers for an application for a patent will be prepared immediately, and forwarded to the inventor for his signature. When the inventor receives the application and finds it duly prepared, he will carefully sign and return the same plainly addressed to us, with postal money order or express receipt for our own fee. The case will then be promptly filed by us in the Patent Office, and vigorously prosecuted to secure the best patent possible. [This course is the most expeditious and satisfactory, as no time is lost in transmitting correspondence relative to the preliminary steps to be taken.] When the patent is allowed the inventor will be duly notified, and on sending the final Government fee of \$20 to us, we will order the issue of the patent, and forward the same as soon as it is secured from the Patent Office.

The payments are thus divided and made easy. We make no pretence of doing cheap work, in order to antiseptic custom, nor do we afterward make additional charges to bring the bill up to a fair compensation. We do our work honestly and thoroughly, and we never give case up as long as there is a chance to obtain a patent. The Agency charge is from \$25 to \$30, or sometimes more, if the invention is intricate or complicated, or requires much labor. Drawings cost from \$5 upward, according to their number and the time employed, and, if a model is sent, the express charges upon this and the papers must be added. The total cost, in addition to Government fees, rarely exceeds \$40, and for this we do all we can without appealing the case.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients sufficient to make the experiment, and also of the manufactured article itself, must be furnished.

Models and Drawings.

Models are now seldom required by the Commissioner of Patents, and generally only in intricate cases. Perfect drawings of practical working machines are considered more satisfactory to the Patent Office than the old and more cumbersome system of storing up an immense bulk of almost numberless models.

Drawings or sketches, sufficient to illustrate clearly the invention, with a sufficient description to enable us to make a full set of perfect drawings for the Patent Office is all that we require. A model will answer our purpose as well however, in cases where the inventor can more easily furnish it for our use.

The value and even the validity of a patent often depends on the character, clearness and sufficiency of its drawings. There are thousands of existing patents in which the improvements are but partially or very poorly illustrated in the drawings. When an attempt is made to dispose of such patents, the vagueness and defects of the drawings often prejudice capitalists and manufacturers against the invention while in reality it may be of great value, and would meet with ready sale had the invention been fully portrayed by artistic and skillfully executed drawings. Again, when patents of this character are brought into court, the uncertainty and ambiguity of the drawings enable the opposing experts to mystify the judges as to the construction or combination of parts intended to be covered by the patentee. In all cases prepared by us, the drawings are made under our personal supervision, by skilled draftsmen in our constant employ, and every precaution is taken that the invention is fully and clearly shown by different views, so that the improvement will be readily understood by the Examiners in the Patent Office, and comprehended by the public when the patent is granted.

In the Patent Office

The application is assigned to the Examiner having charge of the class to which the invention relates. The case must then take its turn with others in the order of filing, and in due time is carefully examined to test the novelty of the in-

vention. If the examiner fails to find anything that anticipates the invention, a patent is immediately allowed, provided the specification and claims are drafted in proper form. Should the Examiner find a prior patent which, in his opinion, anticipates one or more of the claims in the application, a letter of rejection is sent to the attorney in charge of the case; and, if the attorney coincides with the views of the Examiner, the claims rejected are erased. In preparing applications for patents, an attorney should be careful to familiarize himself with the class of inventions to which the application pertains, so that the specification and claims may be drafted as nearly perfect in the first instance as is possible. This course saves much time in prosecuting the application to a patent.

When claims are improperly rejected on patents which do not anticipate the spirit or wording of the claims, proper steps are immediately taken to convince the Examiner of his error. This is done, in most part, by personal arguments, as the differences in construction, operation, function and results are more readily discovered and appreciated by an oral presentation of the facts than can possibly be done by relying solely on written arguments. In order that the Patent Office record of the patents shall be complete, an oral argument is generally supplemented by a manuscript brief, that others, in examining the files at any future time may clearly comprehend the position taken by the Examiner and attorney in prosecuting the case to patent.

In addition to our own personal attention to the interest of our clients here, we have, for over 12 years past, had constantly in association with us in Washington, one of the foremost legal counselors and ablest of practitioners in patent business in this country, who carefully attends in person to our business at the Patent Office, and has attained success in a most marked degree.

Perfect Claims.

The value and force of a patent are dependent on its claims. A patent may disclose to the public the most important and valuable invention, and yet the claim be of such meager scope that the patent is actually worthless. When the claims of a patent are so loosely drafted that infringers can flood the market with improvements, differing from the improvement disclosed by the patent only in slight changes in construction and arrangements of parts, such a patent is valueless to the owner, as it fails to afford him that exclusive and complete protection guaranteed by the Patent Law. Hence it is that the greatest care, skill and perseverance are required, first, in properly drafting the claims in the first instance, and second, in prosecuting the application before the Patent Office, and maintaining the rights of the inventor to claims as broad and sweeping as the invention will warrant. This latter is no easy task. The Examiners of the Patent Office serve in the capacity of attorneys guarding the interests of the public. It is their sworn duty to exercise the greatest care and watchfulness, that patentees do not secure claims of greater scope than they are justly entitled to. It is but natural that Examiners are sometimes in error as to just what scope should be accorded an invention. Although the Examiners act under honest convictions in cases where they refuse an inventor his just rights, yet it is the duty of the attorney to maintain the claims of his client, if he is convinced that they are just and proper. To succeed in this requires the display of tact, firmness and ability; and when the Examiner is made to see that the inventor is honestly and fairly entitled to the claims which have been rejected, he will almost invariably recede from his former action, and allow the case.

Advantages to Inventors on the Pacific Coast.

The firm of DEWEY & Co. (continuously editors and publishers of the MINING AND SCIENTIFIC PRESS, nearly from its early commencement in 1860) offer comparatively far better facilities to the local inventors of the Pacific States and Territories than are possessed by any other agents in America. Members of the firm give personal attention to the applications entrusted to their care. They have been longer in practice in patent soliciting than most agents who are still personally engaged in the business. They have secured more U. S. and foreign patents in the past 20 years (with very few exceptions) than any other firm still existing. Their practice has been so successful and long continued, that the great majority of inventions on this side of the American continent have been patented through their agency, thus affording them great and valuable experience, by thorough information of the true principles and points of novelty in the inventions, whether general in character or peculiarly local to this coast.

The extensive business combination and experience of this firm is undoubtedly one of the most fortunate in existence for affording inventors prompt and reliable advice, and the best possible facilities for securing their full patent rights with safety and dispatch at uniformly reasonable rates.

Every patentee of a worthy invention is guaranteed the gratuitous publication of a clearly-stated and correct description of his invention, in one or more of our influential and reliable newspapers, affording just the circulation that is best calculated to widely inform the class of readers most specially interested in the subject of his invention.

Saving of Time, Etc.

Inventors on this coast will find that owing to our familiarity with inventions and local affairs of this coast, we can more readily and fully comprehend their wants, and thus save much of the time ordinarily consumed in preliminary writing back and forth when distant agencies are employed.

CAVEATS.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from \$10 to \$20. The Government fee is \$10 additional.

To enable us to prepare caveat papers, we only require a sketch and description of the invention.

Rejected Applications.

Inventors who have rejected cases (prepared either by themselves, or for them by other agents), who desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unrivaled facilities for securing favorable results. We have been successful in securing Letters Patent in many previously abandoned cases. Our terms are always reasonable.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so.

HERCULES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding homastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE

THE CALIFORNIA POWDER WORKS,

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and HERCULES Powder.

BOOKS ON ASSAYING.

By C. H. AARON.

PART I.—Gold and Silver Ores.—Price \$1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Gold and Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorching; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Table.

The volume embraces 106 12mo. pages, with illustrations, well bound in cloth, 1884. Price, \$1, postpaid. Sold by DEWEY & CO., Publishers, No. 252 Market Street, San Francisco.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.
Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assay; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part II; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume, which is bound strongly in cloth. Price postpaid, \$1.75. Sold by DEWEY & CO., Publishers, No. 252 Market St., S. F.

BOOKS ON WORKING ORES.

By GUIDO KUSTEL, M. E.

CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Azures, and Gold and Silver Ores generally, with 120 Lithographic Diagrams.

This work is unequaled by any other published embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in single order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Now of Print. Very rare. A few orders only can be filled at \$10 per copy. Sold by Dewey & Co., Publishers, 252 Market St., San Francisco, Cal.

ROASTING OF GOLD AND SILVER ORES (Second Edition and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3, cloth, postage free. Sold by Dewey & Co., Publishers, 252 Market St., San Francisco, Cal.

By C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, \$5. Sold by Dewey & Co., S. F.

Testing and Working Silver Ores

An illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working samples, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles Smelting, Mexican process, Chilean process, Kroehnke's process, etc. Under "Pulverizing Machines" are described the astra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be made of Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings, and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

Price, post free, \$2.00. Sold by Dewey & Co., Publishers, 252 Market St.

MONTGOMERY BROS., Proprietors.

Mining Summary.

(Continued from page 260.)

during the past week from properties of Eureka district to the Richmond Reduction Works: Jackson mine, 13 tons; Lone Pine, 7; Alexandria, 16; Mohawk, 12; Rosalind, 4; Oriental and Belmont, 7; Benson, 1½; and Continental, 3½.

Frieberg District.

ORE.—Belmont *Courier*, April 10: Harry B. Campbell informs us that there are large quantities of ore in Frieberg district that will assay from sixty to seventy dollars per ton in silver. Whenever a railroad runs near enough to these mines to lessen the cost of supplies a boom may be expected in Frieberg.

Hawthorne District.

LAPANTA BULLION.—Walker *Lake Bulletin*, April 7: The last cleanup of Lapanta bullion at Moss mill was about \$15,000. These bullion shipments will make pleasant reading to the English company that failed to complete the purchase of the Lapanta and the Garfield silver mines, the yield from the Lapanta will rapidly make up the entire price that was to be paid.

THE NORTH STAR.—Virginia *Enterprise*, Apr. 13: Tom Daly's mine, the North Star, situated two or three miles to the southward from the Lapanta, in Hawthorne district, promises to develop into a good paying property. Assays from it, made in this city the last day or two, show the average of the ore to be \$20 per ton. It is free-milling gold ore, easily mined, and plenty of it. Twenty-five tons of it can easily be extracted in a day, and, with a small mill near the mine, a big fortune could easily be made. The greatest drawback on the prosperity of these mines is water. This can be brought in iron pipes a distance of nine miles, and this eventually will be done if the mines hold out and continue their present promising and prosperous showing.

GOOD FOR PROSPECTORS.—This is a good country for prospectors. Some of the districts are dry and consequently expensive; but others are well watered and men who do not stay in camps all the time are liable at any time to find a ledge from which money can be taken almost immediately. Quartz carrying free gold is the poor man's rock, and as there are now opportunities for working any kind of ore, and almost a certainty of more reduction works being put up, this is one of the best places in the State for poor men who are not too poor to purchase supplies for a month in the mountains.

Lone Mountain District.

BASE ORE.—Belmont *Courier*, April 10: Uncle Billy Koch will shortly resume work on his Lone Mountain mines. The ore is base, carrying a high percentage in lead. Extensive operations will be carried on at these mines as soon as supplies can be got there at reasonable rates.

Ophir District.

LOOKING WELL.—Belmont *Courier*, April 10: Pat Leonard informs us that the Grizzly and Cinnamon mines of Ophir, of which he is a part owner, are looking well and give every promise of developing into permanent mines. The ore contained in them assays well in gold. It is expected that a company of capitalists will take hold of them shortly, and open them in a manner that will soon make them self sustaining. The mines of Ophir are going to make a big record, and they will do so on merit.

Pioche District.

RUMORS.—Pioche *Record*, April 7: There are rumors abroad to the effect that the mines in Pioche have been sold to an English company and things will soon boom. If the mines here have been sold there is nothing of record to show it. There are negotiations going on and a change cannot take place too soon to suit the people of this county.

San Antonio District.

WORKING.—Belmont *Courier*, April 10: Hon. John Gooding, Superintendent A. B. Eastwood and George Nicholl intend working some of their claims in San Antonio district this Summer. It is claimed by persons well acquainted with this district that good mines exist there, and all that is needed is sufficient capital to open them in a systematic manner to place them on a paying basis.

Sierra District.

DEER GLEN.—Cor. *Silver State*, Apr. 7: A few items from this old camp may interest some of your readers. The mining industry is about as usual, save some excitement about placers, in which Barbour's canyon takes the lead so far. There are some forty or fifty Chinese in the canyon, and the number is daily increasing, which is strong evidence that there is gold there in paying quantity, for Chinamen at least. The ground is all claimed by white men, who sell mining claims to Chinese, at prices ranging from 25 to 75 cents a foot. There is also a small party of Chinese prospecting in Auburn canyon, on the east side of the range, and they are thinking of buying, so I am informed. The Lang Syne mine and mill are running steadily, under the efficient management of John Ross. Some thirty men are employed at the mill and mine. The Auburn is being worked under lease by V. M. Nelson and partners, who are extracting a little ore, but not doing as well as they hoped to do. S. M. Hendra and Stephen Thomas have discovered a gold-bearing ledge, near the old Monroe mine, which bids fair to eclipse anything hitherto discovered in the district. The ledge is about four feet wide, and free gold, visible to the naked eye, is abundant in the quartz.

Washington District.

NO WORK.—Belmont *Courier*, April 10: No work is at present being done in the mines of Washington District.

ARIZONA.

HASSAYAMPA.—Prescott *Courier*, April 10: Messrs. Nels, Gable and Fred Saites, just from the Blue Dick mine, Hassayampa district, report great piles of rich ore. "Boston" and his partners are preparing to sluice out large pot holes on the upper Hassayampa. They cut lumber a mile from their claims and packed it down hill by man power. "Boston" expects to wash out \$50,000 this spring. A note from Hon. A. W. Callen (Old Grizzly), assures us that the Oro Fino hydraulic mines, just below Walnut Grove, on the Hassayampa, are yielding a great deal of gold. The Tuscumbia mine, Turkey creek district, continues to yield silver ore worth thousands

of dollars per ton. Messrs. Jackson & Curtin are taking ore out of the Del Pasco and War Eagle mine, in Pine Grove district. They have leased the Basin mill and will start it up just as soon as sufficient ore shall have been extracted. Placer miners along Lynx creek and Big Bug are making fair wages. Owners of the Gray Eagle mine, Bradshaw district, have refused several offers for the mine, which is both large and rich. They say the ledge runs from seven to nine feet in width and samples away up in gold and silver.

COLORADO.

LEADVILLE MINES.—Herald-Democrat, Apr. 7: The output of the A. Y. and Minnie mines has been very large during the past month. The Chrysolite Silver Mining Company during January yielded only \$17,000 worth of ore. Things look very quiet in the vicinity of the Adelaide and Argentine mines, on the north slope of Iron Hill. A good pocket of ore was recently opened by lessees in the G. M. Favorite, situated on the south slope of Printer Boy Hill. Work on the Litter shaft on the Printer Boy Hill continues. The shaft is going down rapidly, and should soon encounter the contact. Drifting from the bottom of the Leo shaft to the southwest is making fair progress, and the ground begins to look more encouraging. The cupelling furnace at the American smelter is doing good work and is being operated steadily. It produces six to seven tons of litharge a day. Despite the almost impassable roads the Antioch mine, on Breese Hill, continues shipping regularly, and there are ten stamps dropping at the Antioch mill. Judge Curley, who has a lease on the southern portion of the Garden City lode, is driving a drift to explore the lateral, or east and west fault, which is supposed to run up the gulch, and to contain some good ore. Mr. Stotesbury still declares that he will close down the Wolfstone mine as soon as the present contract for 1,500 tons is filled, unless the smelters pay him a better price for his ore than they have so far offered. A considerable amount of exploration work will probably be commenced on the property of the Little Pitsburg Mining Company about the first of May. The property shows large bodies of iron ore in the northern portion of the hill, which, it is thought, contain some fair pockets of argentiferous lead ore. The incline from the foot of the McHarg shaft has been advanced a distance of nearly 200 feet, running through the limestone under the ore. Yesterday the raise started from the incline, 140 feet east of the shaft broke into a fine body of mineral, and the company will soon be in a condition to make large and valuable shipments of ore from their portion of its mine.

IDAHO.

LAVA DISTRICT.—Wood River *Times*, April 7: E. C. Headrick, the notary public and conveyancer, who came in from Lava district about a month ago, advises all strangers to keep away for two or three weeks longer, when they can go, as a rush is expected. Frank Martin, who sold the Horn Silver for \$55,000, has bonded the Golden Chariot, near Martin, for \$75,000, and has a Salt Lake company about organized to take up the bond. Mr. Dillinger has bonded an adjoining claim—the Idaho—for \$6000. The Elkhorn is down 75 feet, with a 4½ foot vein of milling ore averaging \$60 to \$70 per ton. The Hub, Palace, Valley, Sunshine, Arab and other Lava Creek mines are looking finely and show horn silver from end to end. The district will produce considerable ore this summer, and will probably have a population of at least 500 souls.

THE BULLION MINE.—Wood River *Times*, April 7: Colonel Wall called at the *Times* office to-day. He said the development in the lower level of the Bullion mine did not warrant any excitement in the community, but as he did not wish to be accused of suppressing any facts of public interest he willingly stated the following: They have five men at work in the Bullion, but may add two or three men to the force soon. During the past three weeks they have been getting more or less ore, and now have a vein of galena from six to twelve inches thick and go to 35 feet high.

SMOKEY DISTRICT.—George Richardson got in last night from Smoky, where he had been all winter, engaged in development work on a claim in which he is interested. He says that there is a great deal of ore in sight in a number of claims there, and that the shipments, as soon as the season opens, will average at least two car-loads per day. About 30 men are working there now, but in the next 60 or 90 days there will probably be all of 200 men employed. Mr. Richardson had to come in by way of Black's, some 25 miles out of the way, owing to the fact that the road to Croy's gulch is not broken.

THE PARKER.—Ketchum *Keystone*, Apr. 7: The Parker mine, which has been comparatively dormant during the past winter, was the scene of an important strike on Wednesday, the 31st ult. Working in an upraise above No. 2 level, about 125 feet east of incline, a five foot ledge was struck carrying 25 inches of an ore streak and 12 inches of solid galena which is fully up to the standard value of the first-class galena ore. Prof. Jenney, from whom we learn the above, states that the ore body is very promising, and can be definitely determined in a few days.

THE SILVER STAR.—A fine body of gray copper ore—about twenty inches in width—was struck in the Silver Star mine, of the Philadelphia Mining and Smelting Co., on the 27th ult., in the face of the west drift, about 300 feet under the surface. The ore is exceedingly high grade and will assay in the thousands. This is a very important discovery to Ketchum, as the ore from that locality will be reduced almost exclusively at this point. The Smoky road will now undoubtedly be pushed to completion with all possible speed and is destined to be a busy highway during the coming season. The P. M. & S. Co. has several other properties looking well in that locality, among which is the Salamander, and the O. C. King of the West, Carrie Leonard and Isabella are all looking very well at the present time and will probably contribute largely to our local smelters.

MONTANA.

BUTTE.—*Miner*, April 10: The recent "caves" that have occurred in some of the mines of this camp have had the effect of opening the eyes of our mine owners to the importance of securing good, practical

mining men to manage their properties. There is no doubt that there are in this, as well as many other camps in America, good mines gone or going to wreck and ruin on account of injudicious management. This is especially applicable to the underground workings of the mines. The same rule that prevents a banker from hiring a raw, uncouth, illiterate country bumpkin to fill the important position of cashier, should also prevent a mine owner, or those having the control of mines, from having men who have nothing to commend but a knowledge of the market value of ores, the proper keeping of books or the price of a thousand feet of lumber. And yet we constantly see and hear of cases where book-made miners are put in control of mining properties, and properties that have considerable merit.

THE PARROT.—This mine is, without doubt, one of the best managed properties in the world. Its efficient superintendent, Benjamin Tibbey, is a miner of the old school. It is just as safe for a person to go down and wander through the levels of this mine, as it is for him to walk through the hoisting works of the property. Everything is conducted in a safe, careful and judicious manner. The mine never looked better than it does to-day. The stopes on the 200 and 300-foot levels are producing the usual quantity of ore with no apparent difference in the supply. The 400-foot level is opening out in a very satisfactory manner; the two ledges, north and south, are looking well and bid fair to excel anything in richness and extent before seen in the mine. The pretty, compact smelter is working to its full capacity.

THE ANACONDA.—A gentleman connected with this grand property was yesterday asked how the mine looked. He said: "That is a question that is impossible to answer. It is immense, it is wonderful, it is grand." He further said: "You know what the famous Eureka Consolidated mine was? Well, the Anaconda is a far better mine than the Eureka Con. ever was." As the Eureka Con. mine paid over \$4,000,000 in dividends in four years, it is an easy matter for our readers to estimate the value of the Anaconda. The ledge in the 700 and 800-foot levels in extent is almost measureless, while its value is increasing constantly. The property is managed by one of the most careful mining men in the world, Mr. Marcus Daly, while the underground workings of the mine receive the personal supervision of that grand old-fashioned miner, Mike Carroll.

THE PACIFIC.—This mine is attracting considerable attention from mining men, and it deserves all the praise that is being bestowed upon it. The principal work being done is conducted on the 75-foot level, from which point an immense quantity of ore is daily extracted. The ledge at this point is very large, and arrangements are being made to sink the main shaft to the 100-foot level.

THE MINNIE IRVINE.—The sinking of the main shaft from the 150 to the 225-foot level is going bravely on. The stopes on the upper level are yielding handsomely.

NEW MEXICO.

SOUTHERN CAMPS.—Socorro *Bullion*, Apr. 7: The Black Range districts are all improving, but the greatest interest just at this moment is centered in the Kingston mines. The present revival of mining interests manifested in the East will cause many mines in the range and its foot-hills to be actively worked this season. The Palomas Chief is developing splendidly, and is dumping a better class of ore than heretofore. The Antelope and Eagle mines are shipping mineral to the Billing smelter. The Lady Franklin of Kingston, owned by Thompson and Chapman, is turning out on an average about \$80,000 worth of mineral a month. A stamp mill will be erected in the Telegraph district this season. The mill at Lake Valley is running successfully. Prof. Langsdorf is there, but expects soon to return to Socorro. Kingston, Lake Valley and Lordsburg will all make heavy outputs this year.

SOCORRO NOTES.—Bullion, April 7: The Eaton concentrator in the South camp of the Magdalenas has started up and is working smoothly and successfully. Hon. Chas. Blanchard and Rev. F. Lestra took in the Billing works this week. Mr. Blanchard who is president of the L. V. & St. L. M. & S. Co., expects soon to ship mineral to this plant. H. A. Robinson shipped two carloads of ore from the Imperial mine this week to the Billing works. His lease on this property has expired, and G. W. Cook, one of its owners, will at once commence important development work in its lower workings. The Billing works, during the past month, has operated two of its three stacks. The roaster has not been idle. A large quantity of matte is now in course of desulphurization near the works. The plant as usual worked throughout the month without interruption, and it continues to be a practical demonstration of the value of our surrounding mining districts. The Brittenstein M. & M. Co.'s concentrator, in the Pueblo district of this county, lately treated a quantity of mineral from the Gutierrez mine and made from its 200-ounce concentrates. This speaks well for the mine and mill when we consider that the ore thus treated had been sorted over five times, and from it all the richest ore had been shipped to other points for treatment. H. C. O'Rear, superintendent of the Brittenstein M. & M. Co.'s plant and mines, was in Socorro Monday. He and H. F. Brittenstein, who was also in the city, informed our reporter that their mines never looked better, and that the mill and concentrator were in successful operation. They shipped steady consignments of bullion to the East, and will ship their concentrates to the Graphic smelter of this city. The work of enlarging the Graphic smelter continues without intermission. Lieut. Duph has completed the railroad switch to the plant, and quite a number of carpenters and other mechanics are engaged in erecting the additional buildings, and preparing the grounds for the reception of the castings and machinery which will arrive next week to be used in erecting the 80-ton stack.

OREGON.

THE GRANITE CREEK MINES.—Oregonian, Apr. 7: An experienced miner from Colorado, who left there a short time since for the Granite Creek mines, is in the city, on his way to the Colville country. He went as far as Victoria, and from what he learned there concluded not to try Granite creek. He says the paying ground found there was very limited, being in the gorge of the creek, which is only fifteen

to twenty feet in width and only three or four feet to bed-rock. The part of the creek in which the gold was found was very rich, and from the time the diggings were discovered, in August, till the season ended, on November 18th, there was taken out \$96,000. He concluded that from the limited nature of the diggings they must be about exhausted, and that by midsummer they will be thoroughly cleaned out. The north fork of the Similkameen was prospected up for a long distance, but no pay dirt was found. There are rumors of some quartz ledges having been found in that section, but there is nothing certain about it. Under this view of the case he concluded to try the Colville country. He has seen the sensational reports from the Yukon, but has no notion of going there. He has no faith in the reported richness of the diggings, and no notion of traveling 300 miles into the interior of so wild and inhospitable a country on the chance of finding even rich diggings, where the season is only about three months long.

STRIKE.—Albion, Apr. 7: What promises to be one of the richest and most extensive strikes that has ever been made in Jackson county was made by John Robinson and John Slagle on the hills in the front of Grinnell's ranch, some two miles distant in the hills. The find is rich decomposed rose quartz, bearing free gold in abundance. The ledge has been traced on the surface for a distance of over 700 feet, and at a depth of six feet is five feet wide. In every piece of quartz can be found a prospect of free gold. We visited the ledge Wednesday, and found Messrs. Robinson and Slagle at work taking and sacking the quartz, the ledge laying in such a position that one man can take out several tons in a day. Several parties are interested in extensions on the same ledge, which has been traced for some distance. On the location notices we notice the names of D. Miller, Wm. Robinson, F. Barneburg and J. B. Griffin. The above parties being also interested in the first strike.

UTAH.

REVIEW.—Salt Lake *Tribune*, Apr. 9: The week has not been productive of any mining sensations. The weather has been what is not unexpected at this season, alternate shine and storm, with the roads all but impassable. The receipts in this city for the week ending April 7th, inclusive, were \$77,868.87 in bullion and \$21,579 in ore, a total of \$99,447.87. For the previous week the receipts were \$146,159.20, of which \$82,745.20 was bullion and \$63,414.00 was ore. The output of the Ontario for the week was 17,859.37 ounces of fine bullion, and ore to the value of \$1408.31. For the month of March the Ontario product was 101,819.61 ounces of fine bullion, and \$40,270.48 in ore. For three months of this year its output was as follows: Bullion, January, 11,702.37 fine oz.; February, 118,088.19 fine oz.; March, 101,819.61 fine oz.; total, 221,702.17 fine oz. Ore sales, Jan., \$50,872.33; February, 61,054.19; March, 40,270.48; total, \$162,207. A total yield for three months, reckoning silver at \$1.02, of \$500,541. The Daly product for the week was 8839.94 ounces, in fine bars. For the three months of this year it has been as follows: January (ore sales), \$28,455.20; February, \$31,662.06; March, \$24,948.38; March (bullion at \$1.02) \$41,662.11; total, \$126,727.75. Indications point to a yield from the Daly of about fifty per cent as compared with the Ontario. The base bullion output of the week was \$16,795; fine bars, \$19,491 ounces as reported. The Hanauer smelter produced during the week \$20,663 in bullion; the Park city smelter \$1,500. The Germania has not yet begun its product after the clean-up and repairs. The Stormont sent up \$6,157 in silver during the week. The Union National Bank received on the 3d, sixteen bars of Alice bullion, \$13,262.87. Ore receipts were \$2,129; silver and lead ores, \$15,450; Queen of the Hills, \$4,000.

A NEW SANDSTONE FIND.—Pioche *Record*, Mar. 7: Great excitement has prevailed for several days over a new strike in the hills southeast of Silver Reef. The find is near Virgin city, twelve miles distant. Ed. Cripps made the first discovery and samples he brought to the Reef assayed from \$84 to \$119 in silver per ton. The formation is sandstone and the ore of the character of that in the Reef mines. The Frisco *Times* reports quite a stampede of prospectors there.

THE ONTARIO.—Park *Record*, April 10: Everything is progressing finely at the Ontario mine. The usual force of men is doing good work, and the extraction of ores goes on with such grand results and with such regularity that it is getting to be an old story. On account of the bad roads only small shipments are made to the mill, but the mill has stowed away its 2,300 tons of ore to fall back on. At the mill the output of bullion for the week has not been up to the usual standard. Following upon the long and successful run of the Ontario mill comes the announcement that the regular force will be laid off for about three weeks in order to make the annual clean-up and repairs. The mill will close down in about a month and it is whispered that twenty stamps more will be added. There is nothing new to report from the Woodside, Sampson or Morgan, but something of a surprising nature is expected to develop soon in the operations of these and some other mines in the near future.

THE CRESCENT.—Stuart Stephenson, superintendent of the Crescent mine and concentrator, went up to the mine yesterday to pay off the men, some forty in number. The concentrator has been thoroughly overhauled and it is understood that it will begin reducing the ores the first week in May. As soon as this is done the force at the mine will be increased by nearly fifty miners and the tramway will be brought into use again in supplying the concentrator with from 150 to 200 tons of ore per day.

THE BURLINGTON series of mines, in the Independent district, are looking fine. The west end of the Burlington mine, worked by Messrs. Job, Edwards, Maddern & Co., never looked half as well as it does at present. On the 130-foot level of this mine a rich ledge was recently discovered that will result in returning great profits to the worthy lessees and in much good to the camp.

THE ALICE.—Superintendent W. E. Hall reports everything in and around the "Old Reliable" as being in first-class condition. The main shaft is going down towards the 1,000-foot level as rapidly as possible. The 800, 700 and other levels above are looking well and producing in the usual liberal manner.

JAMES' PATENT WHEEL.

This wheel positively has no dead points, no cut-off, and works up to a higher percentage of the power applied than any wheel in use. In this wheel there are two rows of buckets arranged obliquely around the periphery of the wheel, standing out vertically on a line with the center of the wheel, leaving a water-way from and to each bucket alternately.

TATUM & BOWEN,

25 to 31 MAIN ST.,
SAN FRANCISCO.

91 and 93 FRONT ST.,
PORTLAND, OR.

While we are prepared to furnish, and are supplying the most extensive MINING MACHINERY PLANTS, we are, at the same time, manufacturing a full line of **CHEAP MACHINES**, including

ROCK BREAKERS and QUARTZ MILLS

Which we can Sell for Less than Half
the Price of Other Machines.

They are designed especially for

PROSPECTING and for **SMALL MINES.**

JAMES' PATENT ORE CAR.

This Car has two double Tread Wheels that carries it on two pieces of scantling laid side by side, two inches apart, making a track ten inches wide for the car driver to walk upon, and only requires a narrow space in the tunnels or drifts for the track.

IMPORTANT TO GOLD MINERS! SILVER-PLATED AMALGAMATING PLATES FOR SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.

Warranted the Best Made, Durable and Satisfactory. Full weight of silver and best quality of plating guaranteed.

BEST SOFT LAKE SUPERIOR COPPER USED.

3000 Orders filled. References first class. Prices the very lowest. Have received every Medal awarded on the Pacific Coast for Mining Plates. Old Mining Plates Bought, Replated, or Gold Separated.

SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS, 653 & 655 Mission St., San Francisco.
E. G. DENNISTON, Proprietor.

These Plates can also be procured of **JOHN TAYLOR & CO.**, Dealers in Assayers' and Mining Material, 112 to 118 Pine St.

NOTICE.—Mining men are cautioned against purchasing inferior quality of Silver-Plated Mining Plates now being manufactured in this city. There has been a general complaint by purchasers that these plates proved defective in plating and short in weight of silver, assays showing great deficiency in silver guaranteed. Thin, light plating looks the same as heavy, but has no durability. Good plates can be furnished at same price these poor plates cost.

NOTICE TO MINING MEN! SILVER PLATED AMALGAMATING PLATES FOR SAVING GOLD!

Get our Prices before ordering elsewhere. Samples furnished on application.

SAN FRANCISCO NOVELTY AND PLATING COMPANY, No. 21 Stevenson Street.

JUSTINIAN CAIRE, Dealer in Mining Material, Agent, 521 & 523 Market St., San Francisco.

NOTICE TO MILL MEN.—All our plates are guaranteed to have the Full Weight of Silver agreed upon, and are all tested before leaving our Works, thereby avoiding the complaints about light weight, made so often formerly before our starting in this branch of business. PLATES CAN BE FURNISHED AT ANY PRICE REQUIRED.

A Card.

EDITORS PRESS:—The annexed card, with a signature which I cannot read, comes to me with the refreshing and wholesome effect of a slapped face to a spoiled child:

I have read your work on testing and working silver ores. It is almost too sketchy for practical purposes. People might adopt your system to your benefit if they were made to understand it better, etc.

D.

San Francisco.

Since reading this I have been somewhat in the position of the Irishman who was "blne moulded for want of a bating." Surfeited with the praises of those who like my books and other writings, it began to be a question as to whether I had soared above or sunk below the notice of intelligent criticism, and I feared the latter from the fact that I am far from feeling satisfied with many of my own productions.

And yet commendation comes from competent sources. Only two days ago I received a letter from a *rival author*, who is gracious enough to say, speaking of my "Assaying," "I consider your work, both parts, as the best little hand-book on the subject. I have studied and I possess about everything that has appeared during the last thirty years."

I am not proud of "Testing and Working Silver Ores," neither am I ashamed of it. It was originally published many years ago, as years go nowadays, was my first attempt at a book (except a little pamphlet previously), sold very well and, as I know from abundant testimony, did some good. It accomplished, in some measure, the purpose of its creation which was to assist poor miners. The only direct benefit that ever accrued to me from the process described, or attempted to be described, was in my personal use of it for myself or others.

The book was, as Messrs. Dewey & Co. know, in active demand for years after it was supposed to be out of print, and the reason of its reappearance now in its original form is that a number of unbound copies were mislaid and have recently come to light. I, myself, should have preferred a new edition.

The extension of railway facilities and the multiplication of metallurgical centers, first suggested many years since by me in your columns, have greatly changed the aspect of metallurgical possibilities, yet not so greatly but that this excellent process, essentially 300 years old, may still find useful application in many a nook and corner of our vast metalliferous regions, and, notwithstanding the crudities of the book, "any person of ordinary sagacity, and possessing, as is presupposed in the book itself, a fair knowledge of ordinary milling, might, I think, gather from it sufficient information to enable him to work successfully."

This is the first time within my knowledge that I have been accused of not making myself clearly understood—at least by the special class addressed. I do not expect to make a metallurgist out of a harber's clerk by any amount of mere writing. When I have written for chemists or metallurgists I think they have understood me, whether accepting my conclusions or not, and I have been led to believe that the unquestioned popularity of my other efforts has been mainly due to the fact that they could be comprehended by those for whose use they were intended.

If the writer of the card has bought my book and is sorry for it, I am sorry for it; but I suspect he only borrowed it, and had therefore but little time in which to assimilate its contents. I will venture to assure him that if he will do precisely what the book tells him in plain English to do, he will attain the results indicated, but I confess that he will have to furnish at least a modicum of brains for his own use (I forgot to mention that article in the book), and if he is ignorant of the meaning of such a term as "panning out," if he does not know how to strain amalgam, if he cannot distinguish a piece of galena from a lump of coal, he will have to undertake a course of preparatory study before he will be competent to understand even so simple a treatise as mine on "Testing and Working Silver Ores."

C. H. A.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

State Line, April 10, \$4000; Standard Con., 7, \$5971; Bodie Tunnel, 7, \$2158; Con. California and Virginia (for March), \$141,474; Stonewall, 3, \$3000; Hanauer, 6, \$9440; Stormont, 7, \$2957; Queen of the Hills, 7, \$4057; Hanauer, 9, \$2645; Queen of the Hills, 9, \$1200; Alice, 10, \$20,845; Germania, 10, \$2843; Hanauer, 10, \$2650; Queen of the Hills, 10, \$1250; Hanauer, 11, \$2540. There were shipped to the East from Salt Lake on the Utah Central railroad during the week ending April 10th, the following: Twenty-five cars of bullion, 625,431 pounds; five cars iron matte, 133,860 pounds; two cars copper ore, \$60,800 pounds, and two cars sulphur, 56,000 pounds. Wells, Fargo & Co., Salt Lake, received for week ending April 7th in bullion, \$38,415; McCormick & Co., \$47,770; Union National Bank, \$13,202.

STOP, no trifling with my eyes! I will go to Muller, the optician, 135 Montgomery street, near Bush, opposite Occidental,

MINING SHAREHOLDERS' DIRECTORY.

Mining Share Market.

There never has been a time since mining stocks were first quoted, when less interest has been manifested in their "values" than is the case at the present time. Five and ten cent fluctuations are about all there are to record. Neither the Comstock in Nevada, nor Bodie in this State, are showing up anything to make the market any better, though diligent work is progressing on the principal mines in the hope of finding bonanza ground. Even good paying ore without much bonanza to it would be heartily welcomed. On the Comstock a large amount of expensive exploration work is being done not only in the middle mines, but also in the north and south end sections. Huge quantities of low grade ore are daily forwarded to the various mills for reduction, and if there were more mills they would be furnished plenty of work through more mining being brought to bear in the premises. The Consolidated California and Virginia, Crown Point Belcher, Yellow Jacket, etc., furnish several hundred tons of ore per day, keeping numerous men at work where otherwise men and families might go hungry. Exploration work is not at all neglected in these low grade ore propositions. Men are employed at this in the several mines mentioned, opening up further ore resources, and seeking for something better and more important. Good steady progress continues to be made, reducing the water in the Osiston shaft, yet this is necessarily slow, owing to the great extent of ground to be drained. Large shipments of ore from the Consolidated California Virginia mine are daily made, the old ore stopes of the upper levels are turning out ore of improved quality as well as quantity.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department No. San Francisco:

THOMAS J. VEATCH DRUG AND MEDICINE CO., April 10th. Directors, Thos. J. Veatch, A. A. Glascock, A. M. Silverstein, J. G. Libbey and W. H. Worden.

GUILD G. M. Co., April 13.—Capital stock, \$1,000,000. Directors, E. Green, Geo. W. Osborn, A. Judson, C. Stevens and Mark Shepard.

EXCELSIOR REDWOOD CO., April 13.—Capital stock, \$1,000,000. Directors, Chas. A. Hooper, Geo. W. Hooper, Joseph Russ, David Evans and John F. Houlton.

SOUTHERN PACIFIC BRANCH RAILROAD CO., April 12.—Object to build and operate a standard-gauge railroad from a point near San Miguel, San Luis Obispo county, and running in a general southeasterly direction a distance of about 250 miles through San Luis Obispo, Santa Barbara, Ventura and Los Angeles counties, connecting with the Southern Pacific at Newhall, in Los Angeles county. Directors, Chas. F. Crocker, N. T. Smith, W. V. Huntington, W. E. Brown, Timothy Hopkins, S. T. Gage and L. L. Wilcutt. Capital stock, \$10,000,000 in 100,000 shares.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

MOUNT WHITNEY AND SURROUNDINGS.—Capt. J. M. Keeler, of Inyo county, will next week deliver a lecture in Oakland, descriptive of Mount Whitney and the region surrounding it. Capt. Keeler has a large number of stereopticon views of Inyo county scenery, many of them being very curious and startling. This is especially the case with those made from photographs taken on the summit of Mount Whitney, the highest peak in the United States. These views are thrown on a large screen by the aid of the lime-light and lantern, during Captain Keeler's descriptive lecture. The lecture and views have been presented in San Francisco and received great commendation, especially from the Geographical Society,

Send for Circular.

Rural Health Retreat (Crystal Springs,) St. Helena, Cal.

Among the many delightful places for rest, recreation and restoration of mind and frame in California, is the "Crystal Springs Rural Health Retreat," shown in above engraving on this page. The Retreat is situated on the slope of Howell mountain, 1200 feet above tide level, 500 above and over-looking Napa Valley, and two and a half miles from St. Helena, in Napa county. Among the natural advantages are stated: "pure water, dry atmosphere, balmy sunshine, even temperature, mild breezes and the absence of high winds. Across the valley lies the Sonoma mountain range, breaking the sea breeze and shielding the Retreat from the chilling atmosphere of the coast, and presenting a safeguard against catarrh and lung diseases. The grandeur of its mountain ranges, with shrubby canyons lying in beauty at their feet, the famous Mt. St. Helena rearing its lofty head to the clouds, the grassy plain lying beneath, reflecting the sunbeams like a grand mirror before the Retreat, all perfumed with a variety of wildflowers, lend an enchantment to the scene. There are no stagnant pools or marshes within range; rainfall is plentiful, rendering irrigation unnecessary, and malaria is a stranger at the Retreat, and in all this beautiful valley. In fact, the purity of the air on this hillside and in the upper valley is a

specific for malaria, and all diseases affecting the head, throat and lungs, producing a healthy circulation through the mucous passages generally." The Rural Health Retreat is twofold in its character. In the first place it undertakes to do direct work in the cure of diseases by hygienic and rational practice, by thoroughly competent physicians resident in the Retreat. While a radical table is furnished for invalids, and proper diet prescribed for each individual case, no one is confined to a starvation diet, and better and more ample variety is furnished at meals than is usually found upon invalid tables elsewhere. The managers have the services of two thoroughly competent physicians from Eastern cities of many years' experience in practice. They are assisted by two lady attendants having a two-years' course at one of the largest hygienic and surgical sanitariums in the world, with five years' subsequent practice. The Retreat is also a summer and winter resort to all who desire to spend a few weeks or months in recreation, and receive the benefit from rest and breathing this mountain air, whose healthfulness and purity is unsurpassed. For such, a liberal table is especially provided. While the chief object of this institution is to afford a sanitarium for those in need

of hygienic and surgical treatment, ample means are afforded for recreation, and entertainment is provided for all boarders and pleasure-seekers who love decency and good order. Winding and picturesque roads, walls of blasted rock terracing the sidehills about the main building, cottages and drive ways, a fine campus, spacious woods, shady groves, arborescent seats, swings, swinging rings, swinging chairs, will be furnished: dumb-bell and Indian club exercises given to such as may desire them. Calisthenic exercises will also be led by a competent leader. To accommodate their increasing patronage, the proprietors are enlarging and building quite extensively, and in many ways improving their facilities for making the Retreat yet more comfortable for their guests. We feel an especial interest in the Rural Health Retreat, because one of the proprietors of the PRESS, with his family, has recently greatly enjoyed a recreation season there. They assure us that they are exceedingly well pleased with the Retreat for its natural and added beauties and comforts, and for the pure moral tone, the kindness and cordiality which prevail in the management. The accessibility of the Retreat should also contribute to its desirability, both to the invalid and the pleasure-seeker.

THE Sign of the Arkansaw Cough Syrup is looking you all square in the face. Do you want a sure, safe and reliable Cough Syrup? Are you troubled with a Cough, Cold, Bronchitis or Lung Complaint? Do your Babies keep you awake all night with Hacking Coughs, Colds in the Head, etc. Do you want something reliable in the house to meet these emergencies? We answer to all: "Go to your Druggist and get a Bottle of the Arkansaw Cough Syrup, and be troubled no more." Price, 50 cents per Bottle!

DEWEY & CO.'S SCIENTIFIC PRESS PATENT AGENCY is the oldest established and most successful on the Pacific Coast. No. 252 Market St., Elevator 12 Front St., S. F.

DEWEY & CO.'S Scientific Press Patent Agency.

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

CALIFORNIA ARTIFICIAL STONE PAVING CO. (SCHILLINGER'S PATENT.)

SIDEWALKS, GARDEN WALKS, CORRIDORS, OFFICES, CARRIAGE DRIVES, STABLES and CELLAR FLOORS, KITCHENS, Etc.

The Courts here and in the East have decided that Artificial Stone Pavements with plastic concrete and in detached blocks, are infringements on the Schillinger Patent; and also, that when the plastic material is blocked off with a trowel and cut through far enough to control the cracking caused by shrinkage, that such pavement is in law the same as if laid in detached blocks, and is an infringement of the patent. All property-owners having such pavements laid without the license of the above Company, will be prosecuted.

Mining and Scientific Press.

THE BEST PRACTICAL MINING JOURNAL IN THE WORLD.

Established in 1860, this paper has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, \$3 a year. Advertising rates, moderate. Send for samples and further information.

DEWEY & CO., Publishers, 252 Market Street, San Francisco.

THE CELEBRATED Woodbury Oils.

Pure, Perfect, Uniform!

The WOODBURY OILS are in use on the Central and Southern Pacific Railways, and on nearly every railroad and steamship line on the coast.

We are not agents for other manufacturers, but have our own works, and adapt here all our Oils to the requirements of home machinery and our climate. We can show recommendations and records of tests, showing a saving to our customers of 50 per cent on their lubrication last year. Address

CHARLES J. WOODBURY, 123 California St., San Francisco.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake. The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS,
 embracing machinery of LATEST DESIGN and
 MOST IMPROVED construction. We offer our cus-
 tomers the BEST RESULTS OF 35 YEARS' EX-
 PERIENCE in this SPECIAL LINE of work, and
 are PREPARED to furnish from SAN FRAN-
 CISCO or CHICAGO, the MOST APPROVED
 character of MINING and REDUCTION MA-
 CHINERY, adapted to all grades of ores and SU-
 PERIOR to that of any other make, at the LOWEST
 POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DE-
 LIVER in COMPLETE RUNNING ORDER,
 in any locality, MILLS, CONCENTRATION
 WORKS, WATER JACKET SMELTING
 FURNACES, HOISTING WORKS, PUMP-
 ING MACHINERY, ETC., ETC., of any DE-
 SIRE CAPACITY.

**WATER JACKET SMELTING
FURNACES**

For COPPER and ARGENTIFEROUS LEAD
 ores of NEW and ORIGINAL DESIGNS, covered
 by LETTERS PATENT. No other Furnace CAN
 COMPARE with these for DURABILITY, and in
 CAPACITY for uninterrupted work, MORE
 THAN 150 of them are now RUNNING in various
 parts of THIS COUNTRY, as well as many in
 FOREIGN COUNTRIES, giving results NEVER
 BEFORE ATTAINED as regards CONTINUOUS
 running, ECONOMY of fuel, AMOUNT and QUAL-
 ITY of BULLION produced. These CLAIMS have
 been PROVEN BY RESULTS in ANY NUM-
 BER of INSTANCES, and the GREAT SUPER-
 IORITY of this SYSTEM of smelting ores DE-
 MONSTRATED BEYOND QUESTION. COM-
 PLETE PLANTS furnished to order of any CA-
 PACITY, with ALL IMPROVEMENTS that ex-
 perience has DEMONSTRATED as VALUABLE
 in this class of work.

Beyond question the cheapest and
 most effective machine of the kind
 now in use adapted to all grades and
 classes of ores.

This machine has been THOROUGHLY TESTED
 for the past TWO YEARS, under a GREAT VA-
 RIETY of CONDITIONS, giving most EXTRA-
 ORDINARY results FAR IN ADVANCE of
 anything EVER BEFORE REALIZED. A re-
 cent COMPETITIVE TEST at the Carlisle Mine in
 Mexico, showed an ADVANTAGE OF OVER 30
 PER CENT in favor of THE DUNCAN. The
 amount SAVED OVER THE TRUE being suf-
 ficient to PAY THE ENTIRE COST of the ma-
 chines EVERY MONTH OF THE YEAR. One
 of its MOST VALUABLE features is as an AMAL-
 GAMATOR. It saves all THE AMALGAM GOLD
 and SILVER that ESCAPES the BATTERIES,
 PANS or SETTLERS, making the machine worth
 MORE than ITS COST for THIS PURPOSE
 ALONE.

**Baker's Mining Horse Power.**

Possessing all the requirements of a first-class hoist-
 and affording means for the continuous operation of a
 Pump or Blower, without interfering with a hoisting ap-
 paratus. It is made entirely of iron, no piece weighs
 over 300 pounds. At the ordinary speed of a horse, a
 1,000 pound bucket of ore may be raised 120 feet per
 minute. The hoisting drum is under the complete con-
 trol of the man of the shaft, and is capable of carrying
 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.**

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS.
(\$575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco. As the result of a suit, East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

A gentleman with good connections in Europe will be glad of particulars of developed mines or "prospects" of merit for sale. Address NEGOCIO, this office.

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be disconnected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited.

To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

A Long Tunnel Completed.

The Big Bend Tunnel on the Feather River—
An Extensive Mining Enterprise.

The most extensive tunnel and river mining
enterprise carried on in California for many

menoeed, in November, 1882, we gave some account of the enterprise, but there are many features of interest to the mining community which can now be recorded on the completion of the work. It is a noticeable and somewhat remarkable fact that the tunnel has been fin-

the west branch, and finally reach the main river some distance below the Bend. When the water is diverted through this tunnel it will leave exposed about 14 miles of the bed of the river, in the Bend. A glance at the accompanying map will show the location of the tunnel

chine drilling began. Two days later a night shift was put to work, and on the first of the following month three shifts of eight hours each were established. When the operations first began, the plant consisted of a No. 4 Burleigh air compressor, so arranged that it could be driven by

VIEWS AT THE BIG BEND TUNNEL, FEATHER RIVER, BUTTE COUNTY, CALIFORNIA.

years is that of the Big Bend Tunnel Co., in Butte county, by which some 14 miles of the bed of Feather river will be drained so that gold mining operations may go on. To make the bed of the river accessible, it was necessary to run a tunnel 12,000 feet long, which would carry the water of the river at its low stages. This long and difficult undertaking was accomplished on the 12th inst., when "daylight" showed through at the end of the tunnel. At the time the undertaking was com-

ished at a cost considerably below the original estimates—something that seldom occurs in enterprises of this kind.

In the summer of 1882 preliminary surveys were made by James McGann, at that time county surveyor of Butte, and Mr. N. A. Harris, the superintendent of the company. These surveys showed that a tunnel 12,000 feet long, with an average grade of 30 feet to the mile, would carry the waters from above the Bend to Dark canyon, from which they would pass to

with reference to the Bend. The map shows the whole property of the company. The etched or darker portions represent the sections and part sections of land, which, in addition to the river bed and banks are owned by the company. A longitudinal section of the tunnel is shown on the same plate.

The Machinery.

When they started on the tunnel 26 feet were run by hand work to get a face ready for the air drills, and on November 18, 1882, the ma-

steam or water power, an air tank, 4x16 feet, a No. 3 Knowles pump, a 2x8 feet Lawellyn heater, an 8 feet Knight water wheel and fittings, a Buffalo drill carriage mounting four drills, and a complete tubular hoiler, 5x16 feet. Since then there have been added four Burleigh tunnel drills, a No. 4 Clayton duplex air compressor, a No. 5 Baker blower, and an engine to run the blower. It is worthy of note that the superintendent states that 10 hours

(Continued on page 276.)

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Northern California Mines.

EDITORS PRESS:—The Black Bear, at Sawyer's Bar, is running on fair-grade quartz and doing an even business. Bennett's placer claim, near the Forks Salmon, is running steadily and doing well. At Oliver's the sluice was robbed about the middle of March; estimated loss, \$2000. Heald, at Rock creek, is taking out good pay. Alverson & Co., at Horseshoe Bend, are mining. Ten Eyck & Dodge are running on good time, with satisfactory results. Mockerson & Nelson, ditto. At Orleans Bar, Hamilton & Weymouth and Wilder & Perch are cleaning up good run and expect to make a most profitable season. At Red Cap, Allen & Lord are cleaning up very good pay. At Big Bar, Reese is setting in to run on low bar, where he calculates on a big cleanup. At Saint's Rest, Wm. Lord has been having a good deal of trouble with his flume this season, but he is one of the best mine managers on the river, and he is getting this mine in thorough running order. In early days this mine was one of the gilt-edged claims. At Wertchepec, Lord & Smith are running pretty steadily, making a fair profit over expenditures. Capt. Young, just above Kappel Creek, has been stripping off for several weeks, but is now getting down to pay gravel.

At Shragon Wm. Lord is steadily running the Seckwan mine, at good pay. He has not yet got down to bedrock on the lower channel. Those who know the mine best think he will strike it rich when he cleans up bedrock.

At Klamath Bluffs Messrs. Jacobs and Starr are running a tunnel on bedrock level doing assessment work. This is probably one of the best placer mining properties on the river. They call it the Cleveland and Hendricks mine and is covered by a magnificent water privilege. The owners are endeavoring to negotiate for the capital to put the water on.

On Redwood creek which puts into the ocean south of the Klamath, Dr. Hood is getting ready to break ground on his canal which is to convey water from Redwood creek on to the far famed Gold Bluffs which are located on the coast nine miles south of the Klamath river. It is probably the most gigantic placer mining scheme ever undertaken. It would require a lengthy letter to give the details and describe the ground. I think we have a silver boom near at hand. Some very promising ore and finely developed ledges have recently been discovered in this vicinity, easily accessible, with limitless water power close at hand. I may be able to speak more definitely before long. WM. AYRES.

Nanaper Ranch, April 7.

Southern Oregon Mines.

EDITORS PRESS:—Southern Oregon is enjoying a small boom in mining. We have a large number of veins which are known to carry gold, a great deal of quartz mining having been done in an early day. The principal mines now worked are on Wagner and Jackson creeks, not far from here. There has been one claim sold (reported) for \$10,000. This is on Jackson creek. The Walsh & Bragdon mine, on Wagner creek, is being worked, Messrs. Koehler & Brandt, of the O. & C. R. R. being interested. They are putting in a new mill for working the quartz, which is said to run high.

Mr. L. D. Brown, a Portland capitalist, has built a steam mill at Jacksonville, which is steadily crushing quartz. It has a rock-breaker of the Jones patent—a first-class machine whose capacity is 70 tons per day. There are no stamps, but in place of them a pulverizer called the Salmon machine, which works easily 10 tons of rock per day, crushing wet and amalgamating in battery. The principle of the machine is hard to describe although the apparatus is very simple. It cannot get out of order, it amalgamates well and crushes twice as much as the same amount of power applied to stamps. It is also much cheaper than stamps. The mill has a Frue Vaoner which saves the sulphurets. The power is supplied by a portable steam engine. The capacity of the mill is 10 tons per 24 hours.

There is a small prospecting mill at the Blackwell mine which has been running at intervals for two years; also one at Medford of limited capacity. These are not now running. A great deal of work is being done in prospecting and mining upon veins. I will keep you posted. Ashland, Oregon. X.

Two young men, says the St. Helena (Or.) Columbian, arrived at Granite creek not long ago for the purpose of making an easy fortune. On arrival they proceeded at once to prospect. One of them got down on his knees by the edge of the creek and carefully scanned the gravelly bottom, and reported to his companion that there was no gold to be seen. The other got down and took a look and came to the same conclusion. Both of them decided that there was no gold in Granite creek and that the whole thing was a sell, and both returned by the first pack train.

A Fatal Case of Trichiniasis.

The first death from trichina ever known in this township took place in Livermore, on Monday last. The victim was a young man named John Martens, a nephew of Jacob and John Johnson, of this place. He was taken ill about four weeks ago, with all the symptoms of typhoid fever, and it was only within a few days of his death that the nature of his disease was suspected. He then stated that about a week before he was taken ill, he had prepared and eaten a dish of chopped raw pork and beef. This pork must have contained the trichina. Dr. Taylor, who had charge of the case, sent to the city for an instrument with which to make an examination of the case, but before its arrival, the man died.

Martens was a German, about 19 years of age, and had been in this community about four years. He was in the employ of Peter McKeany, of this place. An examination of minute portions of the flesh of the deceased were made by Dr. Taylor, under the microscope, when the trichina were distinctly seen. The worm is but 1-24th of an inch in length, but when magnified 1,000 diameters, its entire internal structure is plainly visible. The trichina is only dangerous when the pork which contains it is either eaten raw or but slightly cooked. A heat of 170 degrees—much below boiling—will kill them, and prevent all danger. By the courtesy of Dr. Taylor a large number of our citizens were accorded an opportunity of examining the trichina worms, and familiarizing themselves with this terrible scourge.—Livermore Herald, April 10th.

As soon as we saw the above, we wrote to Dr. W. S. Taylor of Livermore, who is the physician named, asking for a specimen of the infested tissue for examination. He kindly forwarded it to us, and the examination discloses the trichinae as represented. In our letter to Dr. Taylor we asked especially what he could give about the origin of the pork which communicated the disease: as to whether it was Californian or Eastern. Dr. Taylor replied: "The victim was an employee in one of our meat shops. The hogs for the shop are purchased in small lots all over the valley, and kept in one common corral."

We conclude with regret that the disease sprang from California pork. We have claimed hitherto that our home grown pork was free from trichinae, and if we mistake not this is the first case on record in which the disease has come from the California product. Of course the trouble must be quite rare or it would have been heard from before. As we have the parasite domiciled in our hogs, and as death has been produced by it, it will be well to use extra precaution, and under no circumstances eat raw pork.

In view of the case reported it will interest many to read a fuller account of the dread parasite *trichina spiralis*. The disease trichiniasis, or trichinosis as it is sometimes called, was first traced to its cause in 1860 by Prof. Zenker although the nematoid worm trichina had been discovered and named as early as 1835 by demonstrators of anatomy, who found what was first called "speckled muscle" in the subjects they dissected. Before Zenker's discovery, in some cases epidemics of trichinosis were mistaken for cholera and treated for it; in other cases the disease was supposed to be typhoid fever. One author goes so far as to remark that trichinosis has been treated oftener as one of these diseases than as the trichina disease. Every year the number of such mistakes decreases, and there is at the present day no excuse for mistaking this serious disease for any other.

Concerning the recognition of the disease in the human subject, we must trust to the physicians. The examination of pork is a matter which anyone skilled with the microscope can undertake. In a report of the Calhoun County Medical Society some years ago, was an essay on trichine by Dr. D. C. Hauxhurst, from which we take a paragraph concerning the occurrence of this pest in the body of the hog:

"If it be desired to ascertain if the flesh of an animal contain trichinae, certain muscles should be examined first. The muscles about the loins and the diaphragm will present them in greatest numbers; next, the intercostal muscles may be examined. They are often very numerous in the deltoid and in the muscles of the eye.

The worm penetrates the coats of the stomach and goes directly into the diaphragm. To the muscles of the loins it passes from the intestines by way of the mesentery. Having been observed in muscles at a considerable distance from its breeding ground in the stomach and intestines within a comparatively short period, as in the orbital muscles, it has been suggested that this parasite penetrates the coats of the blood vessels, and is swept into the most distant localities by the circulation. I know of no certain evidence that this is the case. When once within the muscles, which seems to be their normal habitat, the trichinae make their way between the fibers and often travel long distances. Thus it happens that as they approach the tendinous attachments of the muscles, the converging channels between the fibers bring great numbers of them into a very limited space. For this reason, in examining a specimen of pork, the extremities of the muscle should be chosen. I have often found from eight to twelve thousand in these situations in one cubic inch.

In exploring for trichinae a one-inch objective is best. It may be found encysted, that is coiled up in a case or cyst. Sometimes this cyst is calcified and then in cutting the knife may be felt to grate upon the hard coating. Sometimes the case is not calcified and sometimes the worm is free and is seen looped or spirally coiled in various ways. The trichina in the specimen sent us by Dr. Taylor is free as would be expected in a recent invasion.

In looking for the trichinae one has to exercise some patience sometimes in teasing the fibers of the muscle apart, etc., until the outline of the worm or of the cyst is seen. When it is found, higher power can be used and the structure of the pest clearly seen.

Though the discovery of such an organism is unwelcome, it need not excite alarm, for it is well established that only by eating raw or partially cooked pork that there is danger of infection. Salting or smoking does not kill it, but thoroughly boiling or frying will do so. Be sure your pork is well cooked.

He Stayed With His Tunnel.

McKim is an honest Irish miner, who drifted off from Arizona a few years ago into Sonora. He had a little money, but a great deal of faith. Benham says: "I should say here that every mine that has been worked in Sonora, or, indeed, anywhere else in Mexico, has its early history recorded in the archives in the district. Thus, if a claim has laid idle half a century, and one wants to get its record, he has only to get the prefect or local authority of the district, and he is given access to the huge volumes that contain the information. McKim got hold of a claim that hadn't been worked for twenty years, and studied up its history. He found that the last year it was worked it took three shifts of eight men to pack the water out of the mine. He also found that the water increased so fast on them that the mine had to be abandoned, and from that he argued it was by no means exhausted. The problem then was to get the water out. But how? McKim had no money to put up pumps, but he did have a good deal of courage and a strong arm. He went down the hill and resolved to run a tunnel for the mine, to strike the ledge below the water pocket. Nearly five years ago McKim began to work, and for long years has pegged away at that tunnel. He had fully 600 feet to run. For about a year McKim had a brother Irishman to help him, but the latter got weary of the hopeless task, and for the remaining time McKim went it alone. About a year ago he noticed that the face of his tunnel was in moist, crumbly ground, and he got fearful that it would tumble in on him. He didn't go near the tunnel for several days for he was afraid of it. One morning he went up and found the water pouring out of the tunnel like a mill race. The water pocket had broken through and the tunnel was draining the old mine at the rate of 1000 barrels a minute. McKim was beside himself with joy. In a week he explored the mine through the old workings, and he found almost a bed of pure silver. Actually, he cut out cabinet specimens with a chisel. He sacks and ships the ore, and the little property is turning out \$100,000 a year with no other labor than that of McKim and two Yaqui Indians. So much for patient industry and four years of faith and hard work." Chicago Herald.

LOW-GRADE ORE.—A few years ago the violent fluctuations in stocks were due to rich ore hodies, homanza developments being struck in the lower levels at various points along the lode, and sanguine hopes and prospects of more being found. By degrees hope after hope failed and company after company ceased deep explorations, until finally the problem subsided into the low-grade ore proposition—working the extensive deposits of low-grade ore long known to exist in the old upper workings of the mines, and which had been passed in the eager search for something of more sensational importance and speculative value way down in the depths. There is very little of a speculative value in working these former leavings. It is merely a cold business proposition, a simple matter of figuring for a small profit and against possible loss in the daily workings of large amounts of this ore. There is no rivalry between mines on this proposition, and nothing in it to create rivalry or comparative excitement in the respective stocks. And the same may be said regarding the lower levels. The Hale and Norcross mine is the only one being worked below the pumping levels, so to speak, or at the lowest depths attained in the great lode, in which good ore and real paying prospects exist in tangible form. True, development work is proceeding at a corresponding depth in the Chollar and Potosi, yet no ore of value is found as yet, and the water is being pumped out of the Oshiston shaft with a view to deeper explorations in Best and Belcher and Gould and Curry, but, as before remarked, the Hale and Norcross ore development has none other at the lower levels to compare and compete with it as a potent ruling and alternative power in the stock market. By and by, when it shall be found expedient to sink the Combination shaft to the 3200 level, opportunity will be found to commence the regular hoisting of the ore from this Hale and Norcross development, when the resultant increase in price of the stock will be influenced principally by the milling returns and more active and extensive explorations in the mine itself.—Virginia Enterprise.

The State Line mine got \$4,000 from 10 days run of its 40-stamp mill.

Ore Concentration.

The Eureka Sentinel says: "Hons. M. D. Foley and Thomas Robinson left yesterday for the western part of the State and San Francisco. The two gentlemen are partners in a lease of several mining properties in Newark, this county, in which are large hodies of low-grade ore. The object of their trip together is to examine the concentrator in successful use at the Brunswick mill, on the Carson river, and then to decide upon one for use on the Newark ores. Motive power can be furnished cheaply right at their mines, and when once the work of concentration commences there is little or no doubt but that the hullion yield will more than meet their most sanguine expectations."

And the Carson Free Lance says: "There are now in this vicinity three kinds of gold concentrators in operation. There are at the Brunswick four of the Golden Gate; at the Mexican two of the Triumph; at the Santiago two of the Frue. A Golden Gate also is now being placed in position at the Vivian. There is now going on among the proprietors of these concentrators fierce competition for public favor. The greatest amount of ore daily is being crushed at the Brunswick, but the opposition claim that better work is being done either by the Frue or Triumph machine. This is not admitted by the proprietor of the Golden Gate. This little war among the mining men is of great interest to the general public, as upon the success of these concentrators largely depends the future prosperity of this section. At the Brunswick Armstrong, with four concentrators, reduces 130 tons of ore daily, and the assays show that only from 90 cents to \$1.15 per ton is lost in the reduction of Yellow Jacket ore. A day or two since we made a personal inspection of the Golden Gate concentrator at the Brunswick, and were delighted with its operations and pleased with the results already obtained. But best of all it pleases the men who have their money invested in it, and now it is said that it has more than paid its owners for the cost of its erection. Now \$8 gold ore from the Comstock can be reduced at the Brunswick at a profit and it is believed that there are in sight millions of tons of Comstock ore that will mill \$8 per ton. An additional ten years lease of life has been added to the Comstock by the invention of the Golden Gate and other concentrators."

To these paragraphs the Virginia Enterprise adds the following: With regard to the above there is no doubt that many classes of ores can be concentrated to very good advantage. This has been proven at Paradise Valley and other mining points in this State, as well as in California. Since the early days of the Comstock this principle has been recognized, the more especially in the concentration of tailings from the mills, the principal and simplest style of concentrator employed being the blanket sluice. Either of the three styles of mechanical concentrators mentioned above is good and very effective, and each claims advantages in some respects over the others, yet neither is altogether new or infallible. That at the Brunswick mill merely concentrates a certain deposit of free gold ore found in the Yellow Jacket mine, and perhaps might be used advantageously in the reduction of similar deposits elsewhere along the Comstock. But it must be understood that it is only the free gold, sulphurets and heavy base minerals that can be concentrated by either of these machines or any other. None of them can concentrate chloride ores, which constitute about seven-eighths of the great mass of the Comstock. If they could they would have been brought into extensive practical use long ago. The chloride which escapes the amalgamating pans and settlers of the mills can only be caught in reservoirs and slum ponds, while the sulphurets which escape with the tailings can be saved by blanket sluices and other concentrating appliances.

The ores out at Austin, in the Reese River district, are all worked by dry crushing, roasting with salt and amalgamating with quicksilver in the usual style of pans. By thus roasting with salt the sulphurets and other base metal combinations are destroyed or changed and resolved into chloride. Thus the ore is worked up to 97 per cent of its assay value from battery samples, and the tailings are absolutely barren and valueless. This most approved styles of concentrators have been tried on that class of ore in years past, but all failed to save the richest portion, the chloride, consequently it was found the most advantageous to turn the whole into chloride, thus saving about all the precious metal contained in the ore.

This is merely mentioned in illustration of the proposition that although there may be "in sight millions of tons of Comstock ore that will mill \$8 per ton," yet none of the concentrators mentioned can save more than about one-eighth part of it, generally speaking—that is to say, they can only save the free gold and the sulphurets.

In a late issue of the MINING AND SCIENTIFIC PRESS, is an interesting article on the "Exhaustless Gold Repositories of Sierra County," by Miles I'Auson, worthy of a careful reading by our miners, none of whom should be without a copy of this home journal, specially devoted to their interests.—Mountain Messenger.

Coal at Puget Sound.

What It Costs to Mine and Market It.

A reporter of this paper, says the *Seattle Chronicle* of Tuesday, visited this morning Mr. J. M. Colman, manager of the Cedar Mountain coal company, to obtain from him the amount it costs his company to mine and market the black diamonds.

In answer to a question as to the cost of mining the coal, Mr. Colman said:

"Our company would gladly pay miners \$1 per ton to mine the coal and put it on the cars. I understand it is claimed we can mine coal and put it into the bunkers at 56 cents a ton. You will see we are willing to give almost twice that amount for the work."

"What does it cost your company to bring coal to Seattle?"

"We pay 60 cents a ton over the C. & P. S. railroad for all coal shipped to San Francisco, and 85 cents for coal retailed in this city."

"What prices do you receive for your coal sold here and elsewhere?"

"I would first state," said Mr. Colman, "that about two-thirds of the coal mined is coarse and about one-third nut. A part of the coarse coal and a small amount of the nut coal are sold in our yards in Seattle. This coarse coal is screened before it is offered to the public. The coarse is sold here at \$3.50 per ton; the nut at \$2, and the screenings at \$1 per ton. The average price we receive here for the coal sold at our yards is \$3 per ton. The sales in this city amount to less than one-tenth of the output of our mines. The balance is shipped to San Francisco. On its arrival there about one-half of the coal is found to be coarse, one-fourth nut and one-fourth screenings. The coarse sells there at \$5.50 per ton, the nut at \$3.75 and the screenings at \$3.25. We receive on an average there \$1.50 per ton for our coal. It cost \$2.25 per ton for transportation from Seattle to San Francisco. Deducting this amount from the average price received, there would be left \$2.25 per ton."

"It has been alleged that our coal and that of the Oregon Improvement company are sold in San Francisco at \$8 per ton," continued Mr. Colman, "but the prices I have given you are all that we receive for the different kinds of our coal, and then it must be borne in mind always that the transportation from Seattle to San Francisco must be paid out of the prices realized in the latter place."

Upon the figures above given, anyone can calculate for himself the cost of mining and marketing and ascertain the margin left for the payment of other expenses, and for profit by noting the difference between that cost and the selling price. Let the calculation be made, for the sake of convenience, on 10 tons:

EXPENSES OF MINING AND MARKETING.

Cost of mining, per ton, from above interview.....	\$10.00
Cost of railroad transportation of one ton sold in the Seattle market.....	85
Cost of railroad transportation of nine tons sold in the San Francisco market.....	5.40
Total.....	\$16.25

PRICES RECEIVED.

For one ton sold in Seattle.....	\$3.00
For nine tons sold in San Francisco, after water transportation has been deducted.....	20.25
Total.....	\$23.25

From this it is seen that the cost of mining and transporting to Seattle 10 tons of coal is \$16.25, or \$1.62½ per ton; the amount received therefor is \$23.25, or \$2.32½ per ton, leaving a margin of 70 cents on each ton, out of which a multitude of expenses have to be met. In San Francisco, Mr. Colman informed the reporter, the expenses often reduced the margin to a very small figure, and sometimes entirely absorb it. For instance, the expense of maintaining the San Francisco yard, for rent, salaries and the like, foot up \$630 per month. If the coal is taken from the ship to the yards, there are the additional expenses of drayage, wharfage, etc. Wharfage amounts to 12½ and drayage to 25 cents on the ton. Sometimes a part of these expenses are avoided by the sale of the coal from the ship's side. The expenses of advertising, maintenance of the yard, etc., always go on. Then there is invested a huge sum by the company in placing the mine in condition to be operated. The cost of the plant of a coal mine differs from the cost of the plant of a manufacturing establishment in this: That when once the mine is exhausted, the original investment, be that \$100,000 or \$500,000, is absolutely lost; the plant of a manufacturing establishment, though it may depreciate, is never entirely lost.

By a close inspection of the above figures, and by careful consideration of the numerous necessary and incidental expenses that a mining company is compelled to meet, it will be seen that the profits are not at all exorbitant, but border close upon a loss. It requires the strictest watch and the application of sound business principles to prevent an institution of that kind from becoming submerged into debt.

The reporter having made the calculations as above tabulated, inquired of Mr. Colman when he expected to resume operation of his mine.

"We cannot restart our mine," he replied, "at the present prices of coal. The advance asked by our men in their wages would interfere with our starting. We could not meet their demands and operate our mine without losing money. Before we can think of resum-

ing operations there must be an advance in coal."

"I would like to contradict a statement that has been made to the effect that we closed our mines against our employees. While we were just skinning along the division line between profit and loss, we resolved to keep our mine running. However, our employees notified me in writing, and afterward the superintendent of the mine at Cedar mountain, verbally, that they would stop work unless their wages were advanced. This we could not do without suffering loss. They thereupon of their own volition refused to work, and withdrew from our employ."

California and Nevada Borax.

There is a danger menacing the borax industry of California and Nevada in the proposed changes in the duty on borax, borate of lime and all borates, in the Morrison bill now pending before Congress. A petition, numerous signed by citizens of California and Nevada, has been sent to Hon. Wm. R. Morrison, Chairman of Committee on Ways and Means, requesting that the same duty be placed on the crude forms of borax as is placed on the refined forms of the same. There are many reasons, as the petitioners state, why this protection should be granted.

1. There is a great abundance of this crude borax in this country; sufficient, in fact, to supply the wants of the United States for a long time to come, and needs protection in its exploitation as much as any product in the country.

2. These minerals belong mostly to citizens of the United States, many of them poor people, most of whom have entered the laude containing these substances, and paid the Government for the same at full prices, and many of whom have expended large sums in developing their properties.

3. The competition that these parties would have in the free import of crude borates would be by foreigners, and generally, if not exclusively, on foreign account. The most formidable foreign rivals would be the deposits in Turkey, India and Chili, owned, controlled and worked by English capitalists. All of these competing sources are worked by manual labor, or labor of the lowest price, and as they would be brought into this country at a low rate of freight it would bring a destructive competition to American labor that develops this, and thereby tends to develop and assist directly or indirectly many other industries. There are great deposits of these minerals in Nevada. Its production employs many men, and many thousands of dollars are annually expended here in working these deposits, and the purchase of provisions, supplies, etc., necessary thereto.

4. The prices of this mineral are now so low as to leave the product unprofitable to some producers, who have been for this reason compelled to quit, while others continue in the business because their capital, plant and machinery are invested therein and they cannot well let go without actual bankruptcy. In short, the business is in that critical condition that a slight injury would wholly destroy it. To allow now the crude material of this mineral substance from Turkey and Chili to come into this country free and compete with the products here, obtained by our high labor, would be to practically confiscate the property of American producers after they have invested large sums therein, and would throw out of employment hundreds of men who are now supporting in comfort themselves and families in this industry.

TWO MINING HERMITS.—Last November two men took a lease of a mine belonging to C. W. Sickler, located on the west side of Little Cottonwood canyon, on Bald mountain, near Alta. They took up a good supply of provisions and went to work with the intention of staying in that elevated place till spring. A few days ago some citizens of Alta missed a familiar tree which stood near the mouth of the mine tunnel, and beside the cabin, and supposing the tree, cabin and men had been swept away by a slide, organized a party and went up to prospect for them. The trip was a difficult one, requiring most of the day, and when within 150 feet of the cabin their progress was stopped by an immense barrier of snow which they could not pass. They saw smoke coming out far above them, and calling to the men were able to converse with them. They could not come to greet their visitors because they dare not trust themselves upon the snow bank hanging on to the side of the mountain, and which was ready to rush to the bottom of the canyon thousands of feet below. They said they were well, had plenty of grub and fuel, lots of ore and did not intend to come out till May. This is one phase of silver mining which the world knows nothing of. Two hardy men imprisoned 9000 feet above sea level, delving in a mine six long, winter months, with no other companions, no news to read or talk about, virtually out of the world so far as its doings are concerned, is an experience few men would like to go through. And this, too, within sight of this busy, bustling city.—*Salt Lake Tribune.*

M'GARAHAN AGAIN.—The House committee on mines and mining has agreed to report favorably the bill to refer the famous M'Garahan claim to the Court of Claims.

Mine Leasing.

The plan of working mines under the leasing system has grown to a remarkable extent in the past few years. Five years ago not a single mine was operated by lessees, while now nearly one-third of the work done in this district is prosecuted under this plan.

The writer recalls distinctly the application of several miners in the spring of 1881, who requested that the advantage of the leasing and tribute system be indorsed by the paper on which he was employed at the time. The requests were complied with and the plan advocated as having proved satisfactory and productive of good results wherever fairly tried.

The plan of letting mines, as practiced under the leasing system now in vogue here, did not meet with general favor at first. Its principal opponents were the various subordinate officials of the incorporated mining companies, who were receiving large pay for doing little or nothing. They foresaw in it the speedy dissolution of the corps of petty officials about each mine, and other features antagonistic to their own interests. Gradually, however, the merits of the plan forced itself upon the attention of these many inexperienced mine managers then in charge of some of the best of Leadville mines. Finally, as mines failed to pay under incompetent management, there remained but one other alternative to the managers besides leasing the mine, which was to resign in disgrace, and they accepted that of leasing.

Considerable money was made in the beginning by lessees, and many a miner resigned his position and accepted terms to work on a percentage some of the old workings or low grade ore bodies, which had failed to prove remunerative under the operations of the company. Repeated and much heralded success induced others to venture into the leasing business, and competition among the miners for desirable pieces of ground became so active that royalties were advanced by the mining companies until scarcely any profit was left for even the most fortunate miner. In old workings where little or no preliminary dead work was required, royalties frequently ranged from 45 to 70 per cent. Leases in those days were generally made for short periods, rarely exceeding six months, and were given to men to clean up old stopes, work out small seams, sort over the filling in underground ribs, and sometimes to work in dangerous ground, which the lessee was required to keep in safe condition, under which provision the companies shielded themselves against damages for accidents.

Gradually much of the best ground in the old mines, which could be worked at a nominal expense, has been exhausted, and the business is not near as profitable now as it was two years ago. Still, a great many good pockets of ore are daily being opened up, and the quantity of ore shipped from this source is surprising.

The leasing of Leadville mines has, however, more recently developed into a far more important industry than the gleaming of old mines and the sorting over of dumps of waste material for fragments of pay ore. During the past six months or a year a number of leases have been let on entirely undeveloped ground. In such instances exploration work had to be commenced at the surface, often necessitating the sinking of shafts hundreds of feet in depth, and the purchase of heavy hoisting and pumping machinery. In such instances the work is generally done by a company of men, frequently composed of miners and men of money. Leases on new properties are made for a much longer period, and at greatly reduced royalties, compared with old and opened mines. The Houghton shaft, for example, is being sunk by a leasing company which has secured the Star of the West claim for a period of five years, with a royalty of 20 per cent. This company has expended over \$12,000 and sunk a shaft 460 feet deep, in addition to driving many feet of levels, but so far has not shipped a pound of ore. A dozen other shafts are being sunk in this district on leased territory, which will have to be put down 300 to 500 feet before striking the vein.

About four-fifths of the business and professional men of Leadville are interested with practical miners in the operation of leases. They generally provide the supplies and implements required, and sometimes attend to the settlements with the company's agents for the ore mined by their associates. Many persons are induced to interest themselves in order to receive some debt made by the miner while out of work, or during sickness or other cause. Others again enter into the business for the speculation and possibilities it presents. It is a comparatively harmless and legitimate way of playing a game of chance, as the surplus money ventured, if lost, is only expended for labor, and after all benefits humanity, while on an average more silver dollars are taken out of the ground than are put into it.

During the past three months few very great results have been attained by lessees, although a large number have returned fair pay. Among the number who have made small fortunes by leasing may be mentioned Lieutenant Governor Preene, Robert B. Estey, John Isard, James V. Dexter, Fred. Beaudry, Will Boshen, Joseph Doyle and Henry E. Wood.

The contracts as drawn up between mine owners or companies and lessees, are generally very explicit and stern in their exactions from the miner, but are rarely strictly enforced. As

a rule the timbering to be done is specified, also the size at which shafts and drifts are to be sunk or driven. Continuous work is demanded, under penalty of forfeiture of the lease, and the minimum number of men to be worked in a given piece of territory. All ore produced by the lessees is shipped under the direction of the owner of the mine, who designates the reduction works, and collects the price of the mineral. He pays the lessees their portion of the receipts, which vary from 40 to 85 per cent of the amount received on the sale of the ore, and out of which the lessees pay their help.—*Leadville Herald-Democrat.*

Gold Fields of Amoor—An Asian California.

A letter from St. Petersburg in the *Journal des Debats* gives an interesting description of the new California, as the new gold mines discovered in the valley of the Djolguits river are called. This valley is upon the Chinese bank of the Amoor, opposite the Russian colony of Tchuachino, and, as the soil is very marshy and there are no roads, it is only accessible in winter. Gold was first discovered there in May, 1884, and it soon attracted a great many adventurers, the earliest comers being Russian deserters and escaped convicts from Siberia, and by the month of January in last year there was a colony of 9,000 Russians, the total having been very much increased since, while there are also about 6,000 Chinese and 150 adventurers of different nationalities, the last named of whom have joined the Russians, the organization of the colony being altogether Russian. The gold-finders are divided into 722 artels (small groups) of workmen, all of whom are absolutely equal. These artels elect twelve elders (starchina), who do not work themselves but superintend the diggings and receive a salary of 200 roubles a month. They are selected from among the dealers in gold and tavern-keepers, and form a sort of district police corps. They do not meet with any interference from the Chinese authorities in this remote valley, the laws of which are very simple but severe, the penalty of death being inflicted for cheating at play, for adulterating the gold dust, or for theft; while flogging is inflicted for drunkenness during the hours of labor or for bringing females into the colony. Since the foundation of the colony there have been only three murders and two indictments of the death penalty, a Russian having been hung for adulterating the gold dust, and a Jew flogged to death for having spread false news as to the approach of a body of Russian troops, hoping thereby to send down the price of gold owing to the panic. There are twenty-seven taverns in the colony, and owing to the competition the prices are not high, except for spirits. The gold fields, which are 25 miles in length by three miles broad, are said to be very rich, and seven pounds of gold are obtained from thirty-two hundred-weight of gravel, even with the primitive mode of washing adopted there.

MANGANESE.—Some little interest is again being shown in manganese mines on this coast. For some years no mining has been done for this mineral substance, the Red Rock deposit in San Francisco bay not having proved profitable to work. Some 80 tons were shipped from here last year, and now some of the ore in small quantities is being taken from the Livermore deposit, Alameda county, and shipped East, the low freight rates permitting this for the present, at least.

CORRESPONDENT AND AGENT.—Prof. J. B. Patch, acting correspondent and business agent for Dewey & Co., San Francisco, and representative of the *MINING AND SCIENTIFIC PRESS*, *Millman and Mechanic*, *Fraternal Record*, *Pacific Rural Press*, *Pacific States Watchman* and *Masonic Record*, for the State of Nevada and Utah Territory, is in town. He is well pleased with Eureka and its surroundings, and believes our resources will yet astonish the world.—*Eureka Sentinel.*

A rich pocket was found recently on Saxon creek, Mariposa county, by a miner who had worked over ten months and realized but thirty dollars in that time. The first day after striking the pocket he took out \$6,000 and subsequently took sixteen pounds of quartz to Mariposa, estimated to be worth \$3,000. The find created considerable excitement and caused many prospectors to take the field.—*Union-Democrat.*

At Nortonville, Contra Costa County, last Saturday, there was an auction sale of real estate. A brick store that cost \$2,500 sold for \$75, a frame store for \$55 and two dwelling houses for \$19. Coal mining regions, evidently "run down" as well as gold and silver camps, occasionally.

ALL the Indian scouts heretofore used in the campaign against the hostiles have been sent back to the reservation. They will be used only as trailers hereafter. This change in the new administration gives great satisfaction in Arizona.

THE Attwood clinometer, illustrated and described in the *PRESS* of March 20th, is manufactured in this city by A. Lietz & Co. of 329 Sansome St.

Passing Events.

The shipment of 21 tons of copper from the French companies' mines in Lower California brings a new copper region to the front. The mineral resources of Lower California have been very slightly developed thus far, but of late several active companies have gone to work. In copper mines particularly, the peninsula is said to be very rich.

The late very wet weather has extended prospecting and mining operations materially. Many miners, with ore on their dumps are unable to haul it over the roads to the custom mills. In many places mills have run short of wood. Of course prospecting cannot be carried on favorably in rain storms.

We devote considerable space this week to a description of the tunneling operations of the Big Bend Tunnel Company, Butte county, the most extensive river bed mining operation ever conducted in this State. The record of work performed will be found of great interest to miners.

There will be an abundance of water for mining operations in California this year; in fact, so far there has been more than was wanted.

PRACTICAL HYDRAULICS.—The concluding article of the series on this subject by P. M. Randall will appear in next week's PRESS.

Flue Dust from Roasting Furnaces.

The amount of flue dust caught per ton of roasted ore depends on character of ore, its fineness, style of furnace and the draught. Those ores give the most fine dust which, before they are roasted, are light and porous and contain oxide of iron. The ores that give the least are hard quartz orss with sulphurates. Those ores which contain a large proportion of sulphurets do not, of course, need to be crushed as fine as those which contain little, the sulphurets being readily attacked by oxygen and chlorine when unprotected by a coating of minerals not affected by these gases. When there is no sulphur present it is necessary to add it as pyrite, hrimstone, or, best of all, as copperas. The ore should then be fine to facilitate the immediate and complete action of the chlorine.

If the reverberatory is properly handled, it produces the least flus dust, for the motion of the ore is less violent than in the others. With care in the reverberatory furnace the amount of flus dust can be limited to two per cent. From the nature of the Stetefeldt furnace a considerable amount of flue dust passes into the dust chambers, but as practically all of it settles there, and, as owing to the auxiliary fire it is chloridized to a higher percentage than the ore itself, this fact is of no importance. As much as 10 per cent sometimes passes over. This is also true of the Howell furnace, though the dust is not so well settled as in the Stetefeldt. The higher chloridation of the dust, than the ore, is very frequently the case. With the Bruckner furnace this amount of flue dust is usually not large, but it sometimes requires a second roasting.

The actual loss of flue dust is very slight with most ores, where the furnace has plenty of dust-chambers and long flues, and it probably does not often exceed one per cent; but when the ore is very finely divided, even under very favorable circumstances, this loss may reach five per cent. Extensive dust-chambers are usually desirable. As regards the loss of gold and silver by volatilization, no reliable data could be obtained by the census officials, who reported on this subject. That there is such a loss cannot be questioned, but at present there is no accurate means of estimating it. Except with ores containing much arsenic, antimony and zinc, it is probable that it never exceeds one per cent.

Mining Accidents.

James C. Riley was killed in the Star of the East mine, about three miles from Butte, M. T., last week, by the breaking of the windlass rope. The splice in the rope "drew."

On Friday last Richard Bellam, employed at the Kentnck mine, Gold Hill, met with a severe and probably fatal accident. He was top car-man and had sent down an empty car on a cage, when, from some unaccountable reason, the cage stopped in the shaft. No one could understand the difficulty, and Belden concluded to go down and find out. He put a piece of scantling across the mouth of the shaft, tied a piece of rope about 75 feet long to it, and deliberately shinned down it to see what was the matter with the cage. In the profound darkness of the shaft he evidently did not know when he arrived at the end of the rope, or was deceived as to the distance, but as near as was calculated, he must have fallen about 35 feet, lodging upon the iron top or honnet of the cage. Upon examination it was found that there was a partial dislocation of the spinal column, in the small of the back, causing paralysis of the lower parts of the body, including the lower extremities.

Wm. J. McDonald had a leg broken, and Thos. Butterworth was killed, last week, in Little Cottonwood, by the premature discharge of a giant powder blast in the Flagstaff tunnel.

JOHN G. KELLOGG, a well-known capitalist of this city, died this week at Sierra Madre, Los Angeles county. The deceased was a member of the assaying and refining firm of Kellogg, Hewston & Co., which, in early days, did the bulk of business in the casting of \$50 slugs. The business in 1866 was sold to the Bank of California and since that time Mr. Kellogg has led a life of privacy.

A PROPOSITION to grant a bonus for the erection of reduction works at Victoria, B. C., has been laid before the city council.

Nevada.

Smith and Reese Valleys—Their Future as Mining Camps—No. 8.

[From Our Special Correspondent, J. B. P.]

Opposite Mr. Hely's ranch, in Smith valley, Lander county, is a well-formed headland mountain some 3000 feet in high. The beautiful samples of ore taken from this mountain, known as Augusta, and the flattering representations made of its mineral character, induced us to make a personal inspection of its merits. The incline tunnel that enters the mountain some 200 feet from its base, is at an angle of some 35 degrees, and shows a vein of great uniformity, increasing in richness of ore quality to the end of the drift, something like 100 feet in extent. We obtained, through the kind offices of Mr. Towle and his intelligent son, quite a number of very rare specimens of natives and wire silver, at the terminal point of the tunnel, where the lode is from twelve to fifteen inches in thickness and heavily charged with metal. We regard this mine, so far as prospecting, as offering one of the strongest inducements of anything we have seen in this State for the further outlay of capital. The abundance of artesian water and the ample supplies of fuel make this a peculiarly desirable point for the planting of mill property, in case the opening of the mine should justify the outlay.

Mr. Williams, a stock man of Smith valley, also has been quite successful in his mining operations at Bernice, and is now making experiments to see if he shall not find sufficient ore to set up a 10-stamp mill of his own at that point. This prudential consideration of securing a sufficiency of good ore in advance of a mill plant, is one that cannot be too strongly commended in mining enterprises of this class. Such a course almost invariably furnishes a guarantee of success and profit in the outcome.

At Austin nothing was doing in this way of milling, and an unnatural season of slackness appeared to envelop the whole camp. Reese river mines, 23 years since, acquired a lofty fame over the whole west for their surpassing richness and profitable working, and much can be done yet here we believe to make this one of the most productive camps of the West. The ores have generally been of a high grade, but limited in quantity in the vein. Several mines that we entered showed this feature, and the jewelry of the mineral offered us as samples in the type of ruby, wire, horn and native silvers were in the highest degree attractive and beautiful to the eye. The discovery of some very fine lodes on the west side of the Reese river by Messrs. Caton & Dundson, indicates the presence of the precious metals on nearly all sides of this great camp.

Mr. Joseph Moss has a very fine mine adjoining the Manhattan, which, with suitable machinery, will work out a bonanza of wealth for both the proprietor and the capitalist. Indeed, what this camp seems mostly to require is more and successfully directed capital to open up the numerous mines, to plant more economical machinery to crush and reduce the ores, and to arouse a healthy state of activity and competition, to the immense advantage of the miner, as well as to the much greater profit of the merchant, citizen and trader. The ore can never be taken from the mines at a profit where the reduction tariff is \$35 per ton, as is now the case here. Where the haton of a single mill sweeps from the surface all surrounding and competitive interests of a kindred character, as in this camp, nothing of a hopeful nature can be looked forward to until a radical change has been wrought, by the introduction of new capital in the form of new mill plants in the hands of men who are willing to live and let live in this great industry of mining, where so much toil and hardship is expended on the part of the independent forces.

Plans are now being effectually laid for carrying out these new improvements, and we confidently expect that the new mining boom now awakening many new and old camps, will sweep in through this thoroughly stagnated interest, bringing forth a resurrection that will in some measure correspond with its brilliant, historic past.

DANIEL GUERNE, a miner well known in California and Nevada, was murdered near La Trinidad, Sonora, Mexico, while on a prospecting trip to the upper waters of the Rio Haves.

The Big Bend Tunnel.

(Continued from Page 273)

would cover the whole time lost by breakage of machinery in the whole three years and four months. The water wheel is supplied from a ditch carrying 100 miners' inches of water taken from Dark canyon. An iron pipe of 11-inch diameter conveys the water to the wheel, the vertical fall being 275 feet.

Through the courtesy of Mr. N. A. Harris, the superintendent of the company, we are enabled to give this following record of this work in the tunnel:

Record of Work.

The size of the tunnel is 9 by 16 feet.

Distance by hand to	Feet.
Nov. 18, 1882.....	26
" drills Nov. 18th to Dec. 31, 1882.....	373
" Jan. 1, 1883 to Jan. 1, 1884.....	3,503
" " " 1884 " " 1885.....	3,000
" " " 1885 " " 1886.....	3,855
" " " 1886 " April 12, 1886.....	1,155

True length of tunnel.....12,002

In 1883, 18 shifts of eight hours each, or six days' time was lost; in 1884, 14 shifts of eight hours or 4½ days' time was lost; in 1885, 16 shifts or 5½ days' time was lost.

Least distance made in	Feet.
Aug. 1883.....	175
Greatest distance made in Sept. 1885.....	405
Average progress per month in 1883.....	291.9
" " " 1884.....	257.5
" " " 1885.....	321.25
" " " 1886, 8 mths. 12 ds. 330.7	
" " " from Dec. 1 1882 to Apr. 12, 1886.....	301.92

There has been used 154,815 pounds of No. 1 Giant powder; 16,535 pounds of No. 2 Giant powder; 94,669 drill points.

There has been drilled 38,085 drill holes of a depth of 215,949 feet or an average depth of 5.67 feet.

There has been moved 116,167 cars of rock from this tunnel.

There has been used as fuel for engines about 5500 cords four-foot wood.

Distance made from December 1, 1882, to April 12, 1886, 11,898 feet, made by 3605 shifts of eight hours each or an average of 3 3-10 feet per shift. Average time of drilling a round of holes for the period from January 11, 1883, to April 12, 1886, is 2 hours, 54 minutes.

Drilling Operations.

In drilling the holes in the face of the tunnel, 12 holes were generally made in four horizontal rows of three holes each. Sometimes in the hardest rock 24 holes were made. The two vertical center rows of holes were bored at converging angles so as to form a V-shape. This center set of six holes or "cut" was blasted first, and from the first blast from 17 to 20 carts of dirt were usually taken. In the granite there were eight "cut" holes blasted. This would leave six to eight holes on the sides which would be next blasted. In starting the holes the superintendent would suspend two lines or cords carrying plummets from the roof so the plummets would be in the center. These were only put in every few weeks, and were shifted when necessary. Then by sighting along the ends of these cords, which were 30 or 40 feet back from the face, the shift boss could get the exact center of the face.

The holes were all drilled about six feet in depth and were started with a 2½-inch drill. Water was used in all the holes, the stream being forced through a one-sixteenth hole in the nozzle.

Mr. Cribbins, the foreman, attributes much of the credit of the rapid work to the use of the drill carriage, which is much more convenient than columns for the drill. This carriage which was 8 feet 8 inches wide carried four drills, and there were two men to each drill. They would first drill the center or "cut" holes and then pull the arm out close to the side of the tunnel, for the side holes. With a column they could not get so close to the side for there needs to be room for the machine on the side of the column, and room to swing it, etc. In using the carriage all four drills can be run back to blast in the time it would take to remove one column drill.

Another thing for facilitating the work was the "platform." This was made of single planks five feet long, twelve inches wide and two and one-half inches thick. These were covered with half-inch iron, spiked on and the spikes clenched. When these planks were laid they formed a solid shoveling platform 25 to 30 feet back from the face, on the floor of the tunnel. After the blast the men could shovel up all the debris from this platform very quickly, and it made a big difference in hand-

ling the material. Mr. Cribbins states that on several occasions when the platform was not used, he found it took about two or three hours more for the shift to remove the 45 to 60 cars of rock thrown down by the blast.

In driving the tunnel each of the three shifts is made up of a boss, four drill men, four helpers on drills, one powder man, one car man and two laborers. The outside force consists of two blacksmiths, two helpers, one machinist, two engineers, and a number of other laborers varying with the requirements of the work. About 70 men were worked, on an average, outside ones and all. Mr. Harris states that they had the best crew of men he ever saw, steady and good workers, a large number of whom have been at work since the company began operations.

The grade being uniformly down, the removal of the rock is not difficult. The movement of the cars is effected entirely by means of mules, six animals being kept at the tunnel for this purpose. The trains are composed of from ten to twelve cars, and the number of daily trips is regulated entirely by circumstances. They started in with two mules and increased the number to six. These are all living and working now, there never having been any accident to them or with them.

Giant Powder.

Considerably less powder was used in this tunnel than was at first expected. Still, during the whole work, they used, as stated, 154,815 pounds of No. 1 and 16,535 pounds of No. 2—171,340 pounds in all. In some places it took six cartridges of No. 1 giant to each hole; in other places good work was done with two cartridges. The cartridges were 1½ inches in diameter. They had very little trouble from fumes. The compressed air hose came to within 25 or 30 feet of the face. As soon as a blast was made the air hose was unopened and a full supply of air forced in. At the same time the exhaust blower at the mouth was set in motion rapidly and the foul air sucked out through the large pipe. They tried thinning down the fumes with spray, but the men complained that this was all right for a few minutes, though when they began to shovel it seemed that the fumes rose again. They found that forcing plenty of fresh air in and exhausting the gas, smoke and bad air, worked much better.

Character of Rock.

This record shows extraordinary good work in drilling. The character of the rock changed during the progress of the tunnel, and therefore the results of the different months are not strictly comparable with each other. During the first nine months an easily penetrated slate formation, with occasional stringers of quartz and granite, prevailed, with the exception of about 200 feet of very hard diorite. For several months after this, the rock continued hard and difficult to work; but when the tunnel had been driven about 6000 feet, or just half the distance, a black slate was encountered, which, though close and hard, and requiring a large amount of explosives to blast it, permitted excellent speed with the drills. The rock changed often into very hard rock, from the slate and then back into slate again. There were only five places in the whole tunnel which have to be secured by masonry work. At these places the top is to be roofed with timber or iron, and the sides and bottom cemented. No trouble whatever was experienced in the ventilation. The blower at the mouth of the tunnel was used as an exhaust and the air supplied to the drills gave all the fresh air at the face. The temperature has not varied much from 60° F. all the way through.

Ventilation.

The blower is driven by means of a separate engine. It connects with an 11-inch iron pipe, which extends up the tunnel to within 200 feet of the working face. The blower is used exclusively as an exhaust for extracting the smoke and had air from the heading. It is only put in operation 10 or 15 minutes before a blast, and at the same time the air compressor delivers a volume of fresh air directly into the face of the tunnel. This arrangement permits the men to resume work within about 15 minutes after blasting. Both blower and compressor are kept at work until the debris has been removed and the drilling recommenced, when the blower is shut down until just before another blast. A track of two-foot gauge, laid

with 16-pound T-rail, extends from the heading.

No Saloons and No Accidents.

They have been very fortunate in not having any accidents. Not a single man was killed during the progress of the work in the tunnel. There are no saloons within several miles of the tunnel mouth, which is perhaps one reason why the company have been so successful. They secured plenty of ground for their boarding houses, etc., and in addition to buying right of way above and below the tunnel, they also purchased ground to prevent the establishment

prospected much as yet, though it is thought they will pay to mine. There is plenty of dump room on the canyon.

As stated, the tunnel is 12,002 feet long. It was run at a 30 foot grade, except the last 200 feet, where an extra grade is put. Although cut 9 by 16 feet, it will really be 10 by 16 feet, for about a foot of the floor has not been removed, but will wash out when the water is turned on. The entrance of the tunnel is widened out to 32 feet—double width—to give the water a good start. It is estimated that it will take 105,000 miners' inches

by turning the water through the tunnel, the work will be carried on the same as any ordinary river-bed mining. The gravel and sand will be washed in sluices. Water comes in from several side streams, so there is an abundance of that. Several different portions will be worked at the same time, as they cannot work a large body of men in any one place. They will work from 50 to 100 men in a place, and work at least four or five places at the same time, if the river can be worked to advantage. Of course, this is not a hydraulic mine, and nothing is to be put into the river, so there is no danger of legal complication. The fall of the river is such that there is no more debris there now than there was 30 years ago. The gravel on the bedrock is not more than four or six feet deep, and the width of the bed is from 100 to 200 feet. In some places there are many large boulders, but the Giant Powder soon gets the better of that difficulty.

On account of the steep and rocky banks, it has been impossible to wing-dam or flume this part of the river, except in a few places, and at these places it has been worked, though a very small proportion of the river was mined. They worked enough, however, to know that it is rich in places. The river above and below the Bend has proved rich in gold, but this portion it was only possible to work in a few parts. A tunnel such as the one described was the only means by which the water could be turned and the river bed mined.

River Bed Mining.

It is scarcely necessary to call to mind to California miners the rich diggings of the Feather river in the early days. The famous old Cape claim, below Big Bend, yielded \$680,000, in 42 working days, from 3300 lineal feet of river bed. The river channel, both above and below the Bend, has proven itself rich, so the company naturally expect very handsome returns when they lay bare 14 miles of river bed, which, before this enterprise, the miners could not touch. It is curious that the project was not carried out long since, as there has been no question of the richness of the bed of this river. There is, of course, a possibility of finding another "Cape," in which case the whole expense of the enterprise could be paid at once.

Of course, like any mining operation, "chances" have to be taken; but it seems scarcely probable that a river so rich as this has been above and below would be barren in a stretch of 14 miles, especially as this has been a natural sluice for hundreds of years, and there must be more or less gold buried in the beds of sand, gravel or boulders, or packed in the crevices and pockets of the bedrock. How much or how little there is of course cannot be determined until the water is out of the river, and the bed is worked. Yet it seems reasonable to suppose that the company will be paid for all its outlay, and a very handsome profit in addition.

The President, Superintendent and Foreman.

The carrying out of this enterprise is mainly due to the efforts of Dr. R. V. Pierce, of Buffalo, N. Y., the president and largest stockholder. He has always had entire confidence in the success of the undertaking. At the time of his visit to this city last year in conversation with him he assured the writer that he was even more confident of success than when he commenced. Although many tried to "throw cold water" on his ardor, he never faltered in his efforts to push the work, or in his outlay of money. He has put hundreds of thousands of dollars into the enterprise, with, of course, no possible chance of getting a cent back until the whole work was completed. It would be a good thing for the State if we could import a few more men of this enterprising character.

The superintendent, N. A. Harris, is highly spoken of by the president of the company, and in fact by all who know him. He is active, energetic and experienced, and has conducted the work with marked ability. After the preliminary surveys, in which he assisted, the superintendent did all the engineering work without the assistance of outside engineers, and attended to the many and various details in conducting the whole enterprise.

The foreman, Mr. John Cribbins, is a man of excellent character, thoroughly understands his work, and, what is more, thoroughly understands men. He has had large experience. The drilling work has been carried on by him in a most satisfactory manner, as the results show.

The resident secretary is Mr. Ed. Harkness, who has been with the company since it started in that position, which he has filled to the satisfaction of the company, and the employees as well.

The engravings which we use herewith were made by the *Scientific American* mainly from drawings by Chris. Jorgensen of this city. Figure 1 shows the entrance to the tunnel. Fig. 2, hoarding houses and plant in Dark Canyon. Fig. 3, drill carriage in tunnel. Fig. 4, air compressors for supplying air to drills. Fig. 5, map of Big Bend, the tunnel line, and section of tunnel. Fig. 6 is a view of Island Bar in the Big Bend (Feather) river. From this bar considerable gold has been taken, wing dams being used, but it has only been partly worked.

VIEW OF ISLAND BAR, FEATHER RIVER.

of drinking saloons. At the start the company adopted a rule that any man coming about the works intoxicated would be discharged. A few examples served to show that the superintendent was in earnest and no further trouble was experienced. The company bought also

of water to fill the tunnel; and if the head is increased there will be an increase of capacity.

The Dams.

As soon as the river is low enough, a temporary crib dam will be put on, which will probably not be until the last of June. Six heavy

MAP SHOWING TUNNEL AND BIG BEND OF FEATHER RIVER.

gether several thousand acres of land to cover the tunnel site, timber land, etc.

Roads and Trails.

A great deal of work has been done on the surface. Roads have been built so as to get in supplies from Oroville, and a saw mill was constructed near the mouth of the tunnel to furnish timbers. Some 14 miles of pack trail was built around the bend, and this alone cost \$6500, which shows that the canyon is a rough and steep one. The canyon is narrow and its sides precipitous. A telephone here has been built to Oroville, and one will shortly be put in around the bend also.

In winter water has been available for power; in summer steam has been used, though occasionally both have been brought into service.

While running the tunnel some quartz ledges carrying gold were found. They have not been

gates, made of iron and steel and 4½ feet by 8 feet in the clear, are being made at the Risdon Iron Works in this city, for the mouth of the tunnel. These may be closed or opened by screws and wheels. When the crib dam turns the water into the tunnel, a permanent dam 125 feet long and 16 feet high will be built. The river is narrow just at this place. It is 175 feet just above where the crib dam is put in. The slopes of the new dam will be three to one on the upper side and two to one on the lower side. The water rises 50 feet in the river at this point in extreme flows. The tunnel will be able to carry off the river flow for from seven to nine months of the year. When the river gets high, the tunnel will be closed by the gates and the water will then flow in its natural channel.

Working the River Bed.

In working the river bed after it is drained,

MECHANICAL PROGRESS.

Crude Rock Oil for Keeping Steam Boilers Clean.

A correspondent of the *Scientific American* writes as follows: Crude rock oil properly used will keep a clean boiler. With any kind of water within reasonable fitness for use, it will keep it in excellent condition, and free from scale or moving sediment; but the crude rock oil will not do all this unless the proper amount of blowing off be done, for it will not compass the neglect of attendants. The proper way to use the crude oil is to send it into the boiler through this feed water, only once a day, and only in very small quantities. One-half an ounce per day will keep an ordinary tubular boiler of fifty horse-power as clean as possible; and after a few months of regular use the shell will be found as smooth as a piece of jappanned work, provided it was not pitted at the start, and the tubes will be perfectly clean and smooth. The oil must be introduced into hot water, and for some reason it does its work better under pressure. If any "constant feeding" of this oil into a boiler takes place, the fire seams will commence to leak, for this has been tried; there seems to be a call for only a small amount of the oil, and the small amount must not be exceeded.

Parties who have used this "crude oil" for four to six years have in some cases experimented with the amount, and in every case an excess of oil caused a leaking at the seams, while a small amount produced the most complete cleanliness and immunity from scale. In a large plant under the advisory charge of the writer, the use of the "crude oil" has proved that it would loosen the scale rapidly; and in the case of an upright boiler, worked under one hundred pounds pressure, the scale became so rapidly freed from its hold on the tubes and firebox sides that a stop became necessary to clear out the leg of the boiler, and over five inches in depth of loosened scale was found in the water leg. In fourteen weeks another instalment came out, and the coal consumed fell from 4,800 pounds to 3,200 pounds in the same time, the work done by the boiler being increased.

Some amusing instances might be related of putting in "a gallon of oil" at the cleaning of a boiler, on the supposition "it would last," or of using tallow or sperm oil, or of some departure from the "crude rock oil," with a bare escape from serious consequences in two cases, and of "leaky boilers" in others.

"Crude rock oil" can be used in any boiler to advantage, on the same principle as exemplified in the housewife's dinner pot—the oil or grease coats the surface of cast or wrought-iron, and the pot becomes smoother than those not used for boiling greasy meats; but the steam boiler, under pressure, and at a very much higher temperature, with a small amount of oil in motion through the circulation, becomes glazed, and being kept so by the minute particles of oil deposited, offers no chance for the scale to lay hold or to maintain a hold if one be acquired.

Many trials of crude oil in this way have been made in the New England States, especially in the large powers of cotton mills and manufacturing concerns, and its use is extending.

Cleaning up Machinery.

A cotemporary gives the following good advice in regard to keeping machinery clean:

In cleaning up a piece of machinery to keep it in the best working order, some attention should be given to those parts which are out of sight, that generally have the most of the work to do, as well as to be continually shining up the finished work to satisfy the general appearance. Superficial cleaning is all very well as far as it goes, provided that the dirt and dust which settles and collects on the machine is not wiped out in every corner, and all the spacings between the wearing surface filled with the polishing powder from the wiping waste. Many of the vital parts of a machine have had to be removed long before the general overhauling that is instituted to look after the condition of things that are not benefited from any superficial treatment. No machine can be kept up to the highest speed or left at its greatest working capacity, if all the parts where the greatest strains are brought, or the hearings that have the most of the load to carry, are to be neglected. Among the machines of the same class, or the machines of one mill over another, the difference in production is owing as much to the lubrication, and the oil that is used, together with its treatment, as with the builders of the machinery. Besides, a thorough cleaning, that would relieve every lubricated surface of its load of impurities, would seriously hinder the adjustment of a machine, if the bearings are to be disturbed and screw-bolts and check-nuts are to be meddled with to remove the grit that has collected behind a collar or under the shoulder of a journal. The success in the free use of oil, or where the lubricant, however cheap, is thrown all over the machine, is owing more to the continued bathing, that is, washing out the very collection of the grit grinding products that have been working into the machine. A mixture of cheap oil with a little of the very best, must bring a cheap journal in contact with a large amount of decent lubrication where such a circulation

is kept up, though it may not be enough to neutralize the effect of the waste matter the cheap oil may contain. No doubt, where drainage is good, or the drip from the machinery can be easily disposed of, that the slushing method, without regard to general appearance, has proved more beneficial to the life of a machine where the highest speed is to be maintained, but certainly, as a rule, the proper cleaning of machinery has not received that care or attention, nor are they provided with the requisite means of lubrication which sincere regard for economy demands.

Preventing Boiler Scale.

Boiler incrustation has been a subject of much discussion, and the list of methods thus far proposed to offer relief from its annoying and dangerous presence is of considerable length. With but few exceptions, however, their chief claim to attention is to be found in their novelty alone, and the results of their practical application would often prove more surprising than agreeable. This is particularly true of a method to which of late a good deal of currency has been given, and for which it seems German ingenuity is responsible. It recommends that "the feed water should be forced through one of the usual feed contrivances into the steam dome, in which it is mixed by a jet of steam entering concentrically, in order that it may, during the mixing, be cast violently against the cover of the dome. The effect of this movement is that all the water receives the full temperature of the surrounding steam. By this sudden heating, air and carbonic acid are withdrawn from the water, and not only the carbonate of lime but the sulphate of lime and magnesium are extracted and the precipitate occasioned is periodically removed." Whether or no this plan has ever been tried we are not informed. Whatever its effect would be as a means of preventing the formation of troublesome deposit, there can be no question as to its influence as a method of feeding simply. The dome of a boiler is certainly not the proper place into which to direct the water supply, and a test of the method would speedily furnish proof of the desirability of abandoning it. The item is worthy of attention specially because of its tendency to belittle the importance of properly locating the feed-pipe and to encourage the sacrifice of good practice in that respect for something which can be obtained to a reasonably satisfactory extent by already well-known methods.

FIFTH WHEEL FOR VEHICLES.—A device for this purpose, which is simple in construction, durable, and at the same time cheaper than the ordinary fifth wheels at present in use, was patented by Messrs. Pinckney & Terry, of Valdosta, Ga. It consists of a circle or guide having annular grooves on its inner and outer peripheries, the interior one receiving the center or circular portion of the fifth wheel to which the bolster is secured, and the exterior one receiving the curved reach, which extends around it and furnishes the means both for coupling the fore and hinder parts of the running gear, and permitting them to turn independently of each other. This construction enables the inventors to dispense entirely with the king bolt. The fifth wheel is fastened to the front axle by means of bolts which pass through the circle, leaving the center free to work in the inner groove. Among the advantages of this device are the following: There are no king bolts to become broken. The upright pieces that receive the bolster are many times stronger than a king bolt without a reach. The reach is made of iron rod of suitable size, and is strong and perfectly reliable in use. The running gear can be manufactured at one-half the usual expense. The two uprights have threads at the ends for nuts. A piece of iron with two holes fits over the bolster and the arms and is secured by nuts. No dust or dirt can enter the parts, and consequently there is very little wear.

COMPARATIVE ECONOMY OF EXHAUST AND DRY STEAM.—Supt. Manning, of the Amoskeag Company, Manchester, N. H., says, in a note relating to the comparative economy of exhaust and dry steam for heating: "On our lower level, where we always use a large amount of steam for dyeing and drying, in case of low water, I can run our 36 inch x 6 foot Corliss up to a thousand-horse power without any change in the boiler except a slight increase of pressure and whatever increase of fuel there is (of course there must be some) is so small that it falls within the daily variation due to other causes."

A FIRE BANKED FOR SIXTEEN MONTHS.—One of the blast furnaces of the Kemble Iron and Coal Company, at Riddlesburg, Pa., was banked up in November, 1884. After being out of blast nearly 16 months, it was recently opened for the first time, and the fire found still burning. The coke glowed brightly, and on the admission of the blast soon became hot enough to melt cinder. The furnace was started with as little difficulty as if it had only been standing a week.

A LOCOMOTIVE THAT HAS RUN THIRTY YEARS.—The old locomotive "Muckalee" on the Southwestern Railroad of Georgia will be finally retired when the change of gauge occurs, not being considered worth the necessary alterations. This engine was first put on the Southwestern road in 1856.

SCIENTIFIC PROGRESS.

The Varied Mysteries of the Heavens.

It is well known to all who have paid the least attention to the study of astronomy that our sun, with its solar system, in addition to all their other varied motions, are moving at the rate of 160,000,000 of miles a year, in what appears to be a direct motion towards the constellation Hercules. The region of space toward which this movement is tending is exceedingly rich in stars of peculiar brilliancy and many colors—the most of them are much greater than our sun. Besides the great constellation named we are also approaching that of Orion, with its galaxy of green suns. This cluster appears to be a golden cloud of stars clinging together like a swarm of bees, and yet separated from each other by billions of miles of space. Within the boundaries of this cluster there is also one of the most brilliant nebulae which adorn the heavens—"the nebula in Orion"—which may be distinctly seen by a telescope of the very smallest power.

We frequently speak of our sun moving towards a certain point; but we seldom reflect that while we are moving towards a certain point or a certain star, that star is also moving with great rapidity—it may be away from us, it may be towards us, it may be to the right or left at a greater or less angle, so that when we reach the point designated the star we are now approaching will be as far away from us as ever. Astronomers tell us that some stars are rushing from us while others are rushing toward us with almost incredible velocity.

Instruments have been constructed which can tell with absolute certainty whether we are approaching or receding from any given star. The stars we call "fixed" are so only because their immense distance from us renders their motion imperceptible except to the most delicate instruments of astronomical measurement. Every star in the universe has various motions of revolutions on its axis, revolution around other stars and still greater movements of which we can form but a dim idea. The whole universe is in motion of the most inconceivably rapid character. The stars and suns are moving in every and all directions, but all, no doubt, in circles more or less elliptic. Nothing moves in a direct line; curve is beauty, motion is life; a halt would be death and destruction.

New stars are constantly appearing and others are disappearing—that is to our vision. No star, however, is lost. The economy of nature is perfect. The appearing and disappearing of stars is no doubt due simply to their greater or less luminosity. It requires a luminosity of the greatest brilliancy to traverse the inconceivable distances of inter-stellar space. A star which might be very bright at a certain distance would be invisible at a greater distance.

A new star has recently made its appearance in the constellation Orion, of which we have been speaking. This star presents some new and interesting characteristics which are being carefully studied by astronomers. M. Wolf says this star is similar to one of the most marvellous stars in the heavens—Misi Celi of the Whale. It is supposed to be a variable star, which becomes visible and invisible by the increase or decrease of its conflagration. The number of variable stars is very great.

But the most wonderful and incomprehensible of all the mysteries of the heavens is its vastness—its utter illimitability. Should our sun or any other sun commence moving in a direct line at the rate of a thousand millions of miles a year, at the end of myriads of years it would be no nearer to the limits of the universe than when its motion first began. Also the number of worlds in space. Let the tiniest drop of water represent a sun, then count the number of such drops contained in all the oceans and seas of the world, and their number would but just begin to represent the number of worlds in space. Nothing but an infinite mind can comprehend an infinite space.

Among the other wonders now to be seen in the heavens are three comets, which at present can be seen only by aid of the telescope. Two of these will soon become visible in the same immediate neighborhood in the northwestern heavens. The third is about disappearing from even a telescopic vision. Of wonders in the heavens, as well as upon the earth, there is no end.

ARTIFICIAL COCAINE.—One of the great drawbacks to the more general use of this important drug is its great cost. Recently, however, Mr. W. Merck has announced the artificial formation of cocaine, which is probably the first step toward cheapening the production of this alkaloid. He tells us that cocaine may be prepared by heating benzoylecgonine, with a slight excess of methyl iodide and an equal volume of methyl alcohol, in a sealed tube at 100 degrees C. This is not, exactly speaking, an artificial formation of cocaine, but the conversion into this base of another substance contained in the coca leaves, which has hitherto been a by-product of little or no value. Another chemist, Z. H. Skraup, has confirmed Merck's observation just alluded to. He also shows benzoylecgonine to be a by-product in the preparation of cocaine. It crystallizes in transparent prisms. The acetate and sulphate also crystallize in prisms. By the action of hydrochloric acid in sealed tubes, at 100 degrees

C., it is decomposed into methyl chloride, benzoic acid, and ecgonine. This author also says that benzoylecgonine is converted into cocaine by the action of methyl iodide in the manner described above.

Origin of the "Bad Lands."

That part of the great treeless plains of Dakota, familiarly known as the "bad lands," are said to owe their origin to the burning of the coal deposits that once existed there. They are situated principally along the Cheyenne and Grand rivers and the Little Missouri. They are from two or three miles to, say, twenty-five miles in width. In the long ago, the valleys of these streams must have been filled with drift wood. Then followed a period of drift, which buried the accumulation of wood under two or three hundred feet of sediment, sand and gravel. The hurried wood in time, became coal, the veins being in some instances twenty odd feet in depth. Either from spontaneous combustion or from electricity, fires were started in these veins, and they gradually burned out, restoring in part the old water courses by means of the overflow from the accumulation of water in these newly formed basins. Looking upon them, here you see patches of slag, there, great boulders, showing unmistakable evidences of great heat, and on every hand scoria or burned clay resembling broken brick. Where the fires were checked by the caving earth and the coal did not burn, mounds two or three hundred feet in height stand. And according to the *Black Diamond*, a newspaper devoted to the coal interests, published in Chicago, in parts of Wyoming the same process is now going on; vast fields are undermined by subterranean fires, and the blackened, smoking plain is filled with desolation. Trappers say these fires have been in existence for a long time, and the traditions of the Indians point to the same conclusion.

NOT A NEW DISCOVERY.—The origin of natural gas is not so recent as many imagine. In the diary of an old gentleman named Wicksham, it is related that in 1831, when Barcelona, on Lake Erie, was a port of considerable importance, the light-house lamps at that place were fed with natural gas taken from a spring three quarters of a mile away. This spring was in a marshy place, several acres in extent, and the water overspreading, it was constantly bubbling with gas. When the bubbles broke into the atmosphere they would flash if a light was held near. A tower 20 feet across was built over the spot where the bubbles broke in greatest number, and from this rude reservoir or gasometer the gas was conveyed in wooden pipes to the light-house, which was 50 feet in height. Enough gas was collected during the day to supply the burner of the light-house during the night. From wells since drilled Westfield is supplied with gas sufficient for illuminating purposes, but not in quantity adequate for fuel.

GLYCERINE OUT OF DISTILLERY DREGS.—"We are getting an excellent article of glycerine out of distillery dregs now," said a manufacturing chemist, "and as soon as the fact gets to be generally known the refuse of this worm of the still will be worth more than it ever was before. Glycerine is a constant product of the alcoholic fermentation of saccharine matter, and all fermented drinks contain quantities of it. In the distillation of liquids containing alcohol the glycerine does not free itself from the 'mother,' or dregs, not being volatile like the alcohol. The glycerine is taken from the mother liquor by the ordinary chemical methods, and super heated steam is then brought to act in the residuum, which removes the impurities and leaves a choice quality of glycerine. The dregs are used very extensively in the manufacture of glycerine in France, but they have not come into much use in this country as yet."

HOW FAR SOUNDS CAN BE HEARD.—A train of cars is plainly heard on the line of the Atlantic & Pacific Railroad at The Needles for a distance of 78 miles to a place called Cottonwood Island. The discharge of the sunrise gun at Fort Mohave can be plainly heard at Colorado canyon, a distance of 100 miles. Sounds can be understood in the narrows of the Grand canyon of the Colorado for a distance of 18 miles; or, in other words, if a man in one end shouts "Boh!" the man at the other end can plainly hear the echo. The whistle of a Colorado steamer can be heard from El Dorado canyon to Weaver ville, the bead of navigation, a distance of 78 miles, and if somebody tumbles a rock over the precipice at Lee's Ferry you can plainly hear the echo down the river at Weaver ville, a distance of 36 miles.—*Yuma (Arizona) Sentinel*.

FLOW OF WATER THROUGH A LEAD PIPE.—Some experiments have been made by Mr. G. Sacheri to test the flow of water through a lead pipe. The length was 3419 feet; the gradient for a length of 102 feet was 1 in 10.5, and for the remaining distance 1 in 142.86. The pipe was quite new, and of a diameter of 25 millimeters (0.984). The head of water was 29.2 feet, and the discharge was found to be 0.02036 cubic feet per second, giving a mean velocity of 2.335 feet per second. The high rate of discharge is attributed to the good surface of the new pipe.

ENGINEERING NOTES.

Harbor Facilities.

The national Government is spending vast sums annually in improving harbors and rivers throughout the Union. This expenditure is based upon the theory that it is the duty of Congress to see that every reasonable facility is afforded by the national Government to secure good facilities for shipping at all our principal seaports and through all our most important navigable rivers. There are very few who dispute the propriety and correctness of this proposition. The Legislatures of many of the States have repeatedly taken action in this matter by adopting resolutions instructing their representatives in Congress to urge appropriations having this end in view.

While large sums have been expended in other sections of the Union for such purposes California has been decidedly neglected especially so far as the harbor of this city and the rivers flowing into it are concerned. A movement has recently been put, however, which it is confidently expected will result in securing something like a reasonable attention being given to the wants of this coast and our almost only navigable stream.

The section inserted in the river and harbor bill, instructing the Secretary of War to commence legal proceedings to prevent the further deposit of hydraulic mining debris into the Sacramento river, places at the disposal of the War Department sufficient funds to make the declaration effective.

New York harbor appears to be the great vortex in which most of the appropriations are mostly swallowed up. That city has become the great entrepot for most of the commerce finding its way to this country, and through that city also the most of our exports find exit. Nearly every section of the Union is interested in securing the cheapest and freest possible transit through that city of merchandise, either in coming to or going from the country. Whatever these expenses are, they are all averaged upon the consumers and sellers. The tax which is thus paid to New York is not less than \$25,000,000 annually. In addition to this, there is also a heavy expense incurred after the goods have reached terminal points upon opposite shores. Some idea of this enormous expense thus incurred may be inferred by inquiring into the cost of the machinery and means for this short transit.

One railroad line owns 22 tugs, 38 floats and 46 lighters and barges, used for no other purpose than bringing the merchandise from the railroad terminus to the city itself. Another railroad line owns 8 tugs, 19 floats, 46 lighters and barges, a steam lighter and a largesteamer, all constantly engaged for the same purpose. The aggregate cost of these auxiliaries is estimated at over \$600,000 per annum, which, at four per cent, represents the interest on the capital of \$15,000,000.

The necessity for the best harbor facilities are equally important. Great complaint has recently been made of the shoaling of the New York harbor channels by the dumpage into the bay of offal from the street sweepings. Careful examination, however, seems to show that such is not the case—that no evidence of any city dumping has been found in many of the channels examined. In fact it is shown by competent authority that there has been no shoaling of channels during the past ten or fifteen years at least. On the contrary, the facts brought out show that the channels have actually increased in depth.

The trouble seems to be that the draught of vessels has been gradually increasing until the danger point has been fully reached and now Congress is being urgently importuned to deepen the channels to meet the demand for deeper water. How far Congress should go in this direction may be a matter for honest disagreement. The constant depth asked for is thirty feet, which would seem to be not an unreasonable request. Special efforts are now being made to secure firm and united action to this end, in which nearly the whole people of the country are interested.

At a late meeting of the Chamber of Commerce of New York a memorial was received from the agents of all the steamship companies doing business in that city calling attention to the importance of improving the facilities for navigation in that harbor. A series of resolutions were offered by Mr. Stephen W. Carey, a large ship owner, alluding to this memorial and asserting that serious delay and danger, and not infrequent pecuniary loss, was incurred by reason of the shallowness of the entrance to the harbor; that commerce was thereby greatly embarrassed and threatened with effects deteriorating to the future welfare of that city. Attention was also called to the acknowledged proof that the channels might be deepened at reasonable expense and that the natural scourings of the tides would maintain the desired depth perpetually after it was once properly secured. The resolutions declared that Congress should be asked to begin work of improvement at once.

NATHAN APPLETON says of the Panama Canal, which he visited with De Lesseps: "M. De Lesseps has made up his mind on one matter from personal inspection, which is of great importance, and that is that no tidal barrier will be needed at the Pacific terminus of the canal. These views of De Lesseps mean an economy of several tons of millions of francs."

USEFUL INFORMATION.

Colored Photographs on Glass.

The exceedingly delicate colored photographs on glass, says an engineering paper, which have come into fashion somewhat of late, are produced by fixing a paper photograph upon a cushion shaped glass with transparent cement, and when it is dry rubbing away two-thirds of the thickness of the photograph with sand-paper. The thin film left is then rendered transparent by soaking in melted paraffin wax, after which transparent colors are applied, which appear softened down when looked at from the front. The background and heavier portions of the picture are then painted in body color upon the face of another cushion-shaped piece of glass, which is afterwards fixed behind the first one.

An improvement in this process has recently been made by Mrs. Nelson Decker, daughter of the late C. F. Varley, F. R. S., and the first of the young members of his family to have produced a scientific novelty. She has just discovered that the second sheet of glass may be abolished, a better artistic effect produced, and the picture rendered more permanent by being protected from the action of the air and deleterious gases by being wholly embedded in paraffin. She does this by quickly dipping the photograph in paraffin a second time after the transparent colors have been applied, and painting the heavier colors upon the back of this second coat. A third layer of paraffin is then applied, and the background painted upon that; the third coat may be finally protected by yet another layer of paraffin. Some practice is necessary to acquire the knack of doing this efficiently. It must be done quickly enough not to remelt previous layers, and the plate must, after each dipping, be quickly tilted on end in such a manner that the paraffin does not run into ridges and thickened lines, but forms an even coating.

REMOVING OIL, ETC., BY INFUSORIAL EARTH. Scouring or removing oil from substances such as wool and woolen cloth, by means of infusorial earth, has been patented by Groth. This kind of earth is one that absorbs a great quantity of liquid, and is what is used to absorb nitroglycerine and make it into dynamite. The patentee states that it is this extraordinary power of taking up liquids which enables it to withdraw oil from textiles containing it. The process is to warm the textile with the infusorial earth in some apparatus where the temperature may exceed by 10 or 20 degrees the melting point of the oil or grease. As soon as it is liquefied the infusorial earth takes it up from the textile. After this the materials are passed through warm water, which washes off the infusorial earth, leaving the fiber clean. If instead of infusorial earth we read fullers' earth, the principle of the process will be found very ancient.

THE BONE INDUSTRY of the country is an important one. The four feet of an ox will make a pint of neat's-foot oil. Not a bone of any animal is thrown away. Many cattle's shin bones are shipped to England for the making of knife-handles, where they bring \$40 per ton. The thigh-bones are the most valuable, being worth \$50 per ton for cutting into toothbrush handles. The foreleg bones are worth \$30 per ton, and are made into collar buttons, parasol handles and jewelry, though sheep's legs are the staple parasol handles. The water in which the bones are boiled are reduced to glue, and the dust which comes from sawing the bones is fed to cattle and poultry.

WHEN WATER BOILS.—Water does not boil until the tension of the vapor formed by heating it is greater than the atmosphere's pressure. At the sea level, where the pressure of the atmosphere is about 15 pounds per square inch, the water must be heated to 212° before its vapor has sufficient tension to overcome this pressure. At Argenta, Montana, where it is so much above the sea, having a much less depth of atmosphere the pressure is not so many pounds, and the boiling point is correspondingly lower. Water boils at about 200° there. On Mt. Black it boils at 187°; and in a vacuum at about 98°, accordingly as the vacuum is more or less perfect.

STRETCHING EMERY CLOTH.—An ingenious device for stretching emery cloth for use in the workshop consists of a couple of strips of wood about 14 inches long, hinged longitudinally, and of round, half-round, triangular or any other shape in cross section. On the inside faces of the wood strips are pointed studs, taking into holes on the opposite sides. The strip of emery cloth is laid on to one set of the studs, and the file, as it is called, closed, which fixes the strip on one side. It is then similarly fixed on the other side, and thus constitutes what is called an emery file, and which is a handy and convenient arrangement for workshop use.

CEMENT FOR LEATHER BELTING.—One who has tried everything says that after an experience of 15 years, he has found nothing to equal the following to cement leather belting: Common glue and isinglass, equal parts, soaked for 10 hours in just enough water to cover them. Bring gradually to a boiling heat, and add pure tannin until the whole becomes ropy or appears

like the white of eggs. Bluff off the surfaces to be joined, apply this cement warm, and clamp firmly.

TO RESTORE RANCID BUTTER.—Rancid butter may be restored, or in all cases greatly improved, by melting it in a water bath with some fresh burnt and coarsely powdered animal charcoal (which has been thoroughly freed from dust by sifting), and straining it through clean flannel. A better and less troublesome method is to well wash the butter first with good new milk, and next with cold spring water. Butyric acid, on the presence of which rancidity depends, is freely soluble in fresh milk.

GUARDING THE KEYHOLES.—NO MORE PEEPING.—A door lock has been patented by Messrs. Garrett G. Ackerson and Julius F. Shy, of St. Louis, Mo. The keyholes for opposite sides of the door are out of line with each other, and the locking bolt has two key bit receiving notches, and there are also special keyhole guard plates, making a simple and strong lock, not easily picked, and preventing peeping through keyholes.

A FARMING PEOPLE.—Out of a total population of 27,000,000, the farming population of Japan numbers 15,000,000. During the past 10 years the improved breeds of horses, cattle and sheep have been introduced with good results. The farmers live principally upon cereals and fruits. Oats, corn, barley, wheat and rye are the chief grains produced; rice of course being the largest.

FEATHER CARPETS.—A Japanese has invented a method of weaving carpets with feathers. The feathers are reduced to a silky state by use of chemicals and then woven like ordinary cotton.

GREASE ERADICATOR.—Take ammonia, two ounces; saltpeter, one teaspoonful; fine soap in shavings, one ounce; soft water, one quart; mix thoroughly and keep in a covered vessel.

PAPER AND LEATHER are made very pliable by soaking in a solution of one part acetate of sodium or potassium in four to ten parts of water and drying.

In packing bottles in cases for transportation, India rubber bands slipped over them will prevent breakage.

GOOD HEALTH.

The Ethics of Pain.

With a vast capacity for pain, man seems to contain no machinery designed to produce it. It has always the air of a disturbance or an intrusion. Yet, although not omnipresent, it is ever imminent, and by it the energies which are most proper to man are suspended or rendered difficult. It often sweeps away the resolves of the will and dictates its own terms to our moral nature. We can account for the whole of bodily pleasure on physical grounds, but for only a portion of bodily pain. To our moral sphere of being, therefore, as I hope to show more fully further on, we must look for a full account of it. If the maximum of voluptuous enjoyment had been the highest object of our nature, still, even so, room would be found for pain in the animal economy, since in order for existence to be enjoyed it must first be preserved. By pain felt or apprehended we are protected from fatal hurts or warned of their existence, and so with regard to the approaches of the fact of diseased action in the body. And this to a large extent animals share with us. Pleasure seems to have no such preservative element in it, and our capacity for it might be conceived so enlarged as to be a constant blind to precaution and lure to destruction. Pain, on the other hand, is largely charged (as shown above) with a preservative power. An enlarged capacity of pleasure would be certainly followed by an increased pursuit of it. On the contrary, enlarged capacity for pain need not imply the increase of actual pain in proportion. Experience, reflection, and precaution, being elements of our nature, might even make a much less amount of pain actually endured consistent with that enlarged capacity. And to whatever extent these elements of our nature, might even make a much less amount of pain actually endured consistent with that enlarged capacity. And to whatever extent these elements of our nature could succeed in averting pain, some such rules of inverse proportion would probably result. But the tendency then would be to absorb an undue part of our energies in constant manoeuvring to avoid pain. This is neutralized by their being kinds and degrees of pain which cannot be so avoided, although few which are not open to some remedial alleviation.—*British Quarterly Review*.

COLD FEET IN BED.—This is a very common complaint, and one that caused a great deal of sleeplessness—first, on retiring at night; and again, early in the morning we are awakened by cold feet, and cannot get them warm except by drawing them up almost to the chin. This occurs not only in the young, but in the middle-aged and the old. For this there are two remedies, the hot bottle and lamb's-wool socks, either or both of which may be used. When we consider that during the day, while we are

active, we wear stockings and shoes, does it not seem strange that at night, when the temperature of the air is lower, and when we are inactive, that our feet should have less covering than during the day? The reasonable plan is to have a special pair of socks for night use, and put them on when going to bed and change them when we get up; the result will be better and more serene sleep, consequently we shall be more able to undergo our daily exertions. I say at once, to all who suffer from cold feet, get a pair of warm socks for night wear. A good wool for half an hour before retiring warms the feet and sends a nice glow all through the body and disposes to sleep. It must not be supposed that these remedies make one less able to stand cold; they are simply to retain the heat of the body and slow of comfort, and, if followed, much benefit will be derived.

Manifold Uses of Cocaine.

The use of cocaine as an anæsthetic and a therapeutic has been taken up rapidly by the medical profession and its application has been made in a remarkable variety of forms of disease. Dr. Knapp, professor of ophthalmology in the medical department of the University of the city of New York, in a recent work "On Cocaine and Its Use in Ophthalmic and General Surgery," says: "No modern remedy has been received by the profession with such general enthusiasm, none has become so rapidly popular, and scarcely any one has shown so extensive a field of useful application as cocaine." The author states his belief that its properties will be the subject of scientific researches and chemical observations all over the globe for many years to come.

Cocaine is applied in shraging the larynx, in cases of bronchitis, and always gives relief. It is applied in probing the tear ducts, in removing tumors and ingrowing toe-nails, in earache, throat troubles, the removal of bullets and the removal of superfluous hairs from the upper lip of a female patient, in dental surgery, in excisions, neuralgia, hypodermic injections for pain and headache through treatment of the eyes. The general advantages of the use of the drug are found to be that its action is transient, and it does away with reflex excitability in the patient. Its useful fields are found to be much more general than was at first supposed probable, reaching even into general surgery.

The secret of the value of cocaine in its application to the mucous surfaces is that it penetrates the exterior coat of the membrane and produces rigid contraction of the muscular fibers, causing thereby a striking diminution of the calibre of the blood-vessels themselves.

One important disease which cocaine has been found to reach, in consequence of the property just stated, is hay-fever. The diseased condition of the mucous membrane of the nose in a pronounced case of hay-fever is marked with a swelling of the veins and blood vessels generally. This is due to a lack of action of the nerves of the coats of the mucous membrane. Cocaine causes a contraction of the muscular coat, thereby expelling the blood, while the extreme dilatation does not return.

A prominent physician says that he has been unable to find that the action of the drug is more than local, and he has observed no reaction following its local use. There is no danger of a "cocaine habit" being formed, in his opinion. The investigations of chemists are being actively turned to methods for reducing the cost of the drug, which is now very large. If a cheap process for its preparation can be found it will prove one of the greatest boons to mankind.

ANCIENT ANÆSTHETICS.—A recently discovered manuscript by Ahelard gives curious information concerning the means employed by the surgeons of his time to produce insensibility during their operations. Pliny mentions a stone of Memphis which, brayed and applied with vinegar, was put on particular parts of the body to anæsthetize them. He, Dioscorides, and Mattheolus speak of putting patients to sleep previous to operations by causing them to take, in bread or some other food, the juice of the leaves or a decoction of the roots of mandragora, or a dose of the plant called morion. Opium and hemp were used by the Chinese. In the polycomposite pharmacy of the thirteenth century a preparation was made of opium, the juices of henbane, mandragora, hemlock and other plants, with which sponges were charged. Having been dried in the sun, the sponges were moistened when it was desired to use them, and then applied under the noses of the patients as chloroform sponges are now applied.

DIGESTIBILITY OF CHEESE.—Of the 18 varieties experimented with, Cheddar was digested in the shortest time, (four hours), while uripie skim Swiss cheese required 10 hours for solution. There is no difference in the digestibility of all sorts of hard cheese, or all soft cheese, but all fat cheeses are dissolved the most rapidly, because, being open by reason of the fat, they are more readily attacked by the solvent. There is no connection between the digestibility and the percentage of water present in the cheese, but there is some connection with the percentage of fat and the degree of ripeness. From examination of the quantity of nitrogen dissolved, the author concludes that, on account of its great digestibility, cheese is the most nourishing of all foods, meat and eggs excepted.—*Journal Chemical Society*.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MOORE.—Amador *Ledger*, April 17: The men who undertook to sink the shaft 100 feet deeper threw up the contract last Saturday, after sinking about 15 feet. The reason for surrendering the job was that an effort was made to keep the mill running and sink at the same time. There being but one shaft and one bucket, the contractors realized that it would not justify them to continue work under such conditions. Since Saturday the sinking has progressed under day labor. Nearly 40 feet has been sunk. Hoisting rock from the shaft has been abandoned until the sinking is completed. Another contract is expected to be let this week. The mill is kept running on the old dump pile, which is said to pay something over expenses.

MIDDLE BAR TUNNEL.—This enterprise is now in over 3300 feet. It was thought that it was immediately under the old works where the rich pockets were encountered. A careful survey was made, which proved that the header was still 30 feet from the upper shaft. Latterly considerable quartz has been met with in the tunnel, some of it of high-grade and carrying the same kind of black gold-bearing metal which has made the district famous. The tunnel is still in the granite formation, and the present indications encourage the belief that rich developments will yet be made. W. A. Nevills and Capt. Nichols went to San Francisco Monday morning, taking with them a sample of rich ore lately taken from the tunnel.

MISCELLANEOUS.—The North Star quartz mine, in Volcano district, was sold by sheriff's sale on Monday last, under a judgment against D. A. Crockett et al. The property was bought in by the judgment creditors, P. A. Chute and Daniel Kees, for \$446, the amount of judgment and costs. It is reported that a fine body of quartz has been struck in the New London mine just south of the Pacific. We have not heard the particulars. The Gover is moving along steadily. Since the new water wheel was put in at the mill the crushing capacity of the stamps has been doubled. At the mine also a great improvement has resulted from the introduction of large iron tanks for bailing out the water. About 30 men are employed about the mine. There is a good deal of prospecting going on among the mines in Pioneer district. On a number of claims there is a quantity of rock on the dump awaiting crushing at Mace's mill. Some of the ore looks exceedingly well and everything points to a revival of the mining industry in this district. The ledges, as a rule, are small but exceedingly rich. Mr. Stillman is putting up the Dryer cannonball quartz mill at Big Bar, bridge for custom work. The repairing of the shaft at the Zele is progressing nicely. They have passed the point where the timbers were crushed together; they are now working where the shaft timbers are in a fair condition, and the work consists in removing the mud and rock with which the shaft is choked.

Calaveras.

MINE SOLD.—Calaveras *Chronicle*, April 16: The Tiger mine, situated at Rich Gulch and owned by Mr. C. Schlund of this place, was sold during the week to an English company. The new company intend putting up a large mill and the erection of new machinery throughout. We have heard that \$10,000 was the price paid for the property.

SLICES ROBBED.—One day last week somebody robbed the sluices in the Hughes' hydraulic claim near the Junction. Mr. Ben Hughes, the owner of the mine, says the robbers must have got in the neighborhood of \$200 as the result of their labors.

INDIAN CREEK.—*Mt. Echo*, April 14: A gentleman recently from the Indian Creek mining district, gave us the following interesting items concerning the mining interests of that section. Indian Creek is situated about twelve miles northeast of Angels, and is at present a lively and promising mining centre. Work is being pushed with a vim and vigor of true energy, as may be seen by the following notes: The Calaveras mine, now bonded to the famous Sheep Ranch mining company, for the round sum of \$100,000 by its owner, Thomas Goodwin, is now being opened up in proper shape under its new management. This mine has been worked at intervals for a number of years, the shaft is now 400 feet in depth. Unassorted ore from this mine milled at the Sheep Ranch mill yielded an average of \$25 per ton. The company intend erecting a 20-stamp mill on the premises shortly. The future of the Calaveras mine is very promising. The Conliff mine now about 80 feet in depth, with a ledge from 4 to 12 feet in width. The richest rock seen in this section for some time was recently extracted from this mine. There is a five-stamp mill on the mine, which is kept in constant motion night and day. The ore thus far milled yielded an average of \$30 per ton, and an abundance of the same character of rock is in sight. Judging from the developments already made at the Conliff, it bids fair to prove the leading mine of that section. The Saltwater mine, which is at present bonded for a considerable sum to the Boston Mining Company of Murphy's, is making a wonderful showing. The shaft is down 100 feet, and shows a well defined ledge five feet in width, of what is familiarly termed by mining men "ribbon" rock. The ore at present is hoisted by the power of a one-horse whim. A large mill and hoisting works are soon to be erected upon the ground. The Esmeralda mine, adjoining the Saltwater mine on the west, from which 25 tons of ore was recently milled in Smith's mill at Angels, yielded \$32 per ton. The shaft is 45 feet in depth, with a well defined ledge in sight. This mine is the property of Kelley & Krause, who have great faith in its proving a valuable, paying property. On the west of the Esmeralda mine, is the celebrated Naragansett mine, owned by W. H. Mathewson, where operations are being exercised with marked energy. A ledge two and a half feet wide has been tapped at the depth of 65 feet. No rock from this mine has yet been milled, but recent assays run as high as \$200 per ton. The rock contains an abundance of galena sulphurets which are immensely rich. There is no mill at this mine, but the facilities for transportation to a mill are all that could be desired. There are

numerous other minor ledges in that section that are being prospected and have made satisfactory showings. The quartz belt lying between Indian creek and San Antonio creek, is possessed of a superior quality of milling ore.

Inyo.

LOWER COUNTRY ITEMS.—Inyo *Reporter*, April 15: German & Mackenzie are preparing to start up the Swansea furnace again. The Ygnacio people are getting out some fair ore, but say it is too base to mill, and it is probable the company will run the furnace in the near future. The output of ore at Cerro Gordo is reasonably good; no new strikes worthy of special mention. There is not much being done at the Darwin at present; Henry Mack has gone to San Francisco in reference to Defiance matters.

IMPORTANT MINING TRANSACTIONS.—Inyo *Independent*, April 17: Several important mining transactions have been made at Cerro Gordo. A. R. Conklin has sold his one-third interest in the Summit No. 2 mine to William Steel, of San Francisco; the latter supposed to have been acting for the Ygnacio Con. Mining Company. H. Kramer, of San Francisco, has also sold to the same party his two-thirds interest in the Summit No. 2, and also the Mono and Mauida mines in the same locality and a half interest in the Potosi tunnel. It is reported that in the latter property a fine body of ore has been uncovered. These transactions place this group of mines in the hands of parties well able to work them and develop them in good shape, and it is more than likely that in a short time the mill at Keeler will have plenty of ore to crush. At the beginning of the week the Maxim mill was started up on a trial lot of ore from a recent strike in the Hope mine, at Chrysopolis. The run will be finished to-day or to-morrow; the result is awaited with considerable interest.

Nevada.

TEXAS.—Nevada *Transcript*, April 15: The prospects of making a good mine out of the Texas are now more favorable than at any time since it became the property of the present owners. The company has had many difficulties to contend with, but nevertheless they have pushed the work along until they have now become satisfied that they have a valuable property. About a year ago they commenced running a tunnel from Deer creek, and it is in a distance of about 250 feet, a good portion of it being in hard rock. About ten days ago they struck a fine looking ledge and stopped work on the tunnel and commenced running an east and west drift on the ledge. They run in on the west drift about 80 feet and now have a ledge of a little over five feet, and running through it is a streak of solid ochre showing free gold, which will undoubtedly pay \$100 or more per ton, and the rest of the ledge looks well and will probably yield \$15 or \$20 per ton. In the east drift the ledge is a little over a foot and looks well. About 70 tons of rock have been taken out and will be crushed at the Deadwood mill as soon as the roads are passable.

Placer.

DUTCH FLAT.—Cor. *Placer Republican*, April 14: Foss & Ballantyne, two mining men from San Francisco, have commenced running a bedrock tunnel for the purpose of prospecting the old Kinder claim situated at Bear River crossing, about ten miles from here. I understand they have purchased the ground. Parties who are acquainted with the property think they will strike good paying gravel. S. Wheeler, formerly Superintendent of the Liberty Hill mining company, has leased the Glenbrook place between Nevada City and Grass Valley, for a term of five years. Saturday afternoon, the Phoenix mine ran into some exceedingly rich ore, in the stope above the bottom level. A blast was put in and the ledge opened up its treasure chamber bright with pure gold. From a very little place about three candle boxes full of specimens were taken, aggregating about \$600 or 700. The ledge here is from ten inches to one foot in thickness.

LIVE OAK.—F. Chappellat says he is making good progress in developing the Live Oak mine, and thinks it will turn out as well as the May Flower. The shaft is down and the tunnel was begun on Monday. The shares in this mine are selling at fifty cents.

THE OLD PENNSYLVANIA.—Nevada *Transcript*, April 17: The Pennsylvania mine, on Wet Hill, is about as well known as any mine in this district, notwithstanding it has not been worked for a good many years. It was owned at one time by Harvey Helm, W. L. Tisdale and others, who sold it to an English company for a large sum of money. For a while after the new company bought it considerable gold was taken out. As it did not yield as large returns as the English company expected, they ordered it closed down. They had run into low grade ore which did not pay for the working, and instead of prospecting for better rock they became disgusted, and no work has been done on it since they quit. A year ago Thomas & Co. purchased the property at a tax sale, and have recently obtained a deed from the English capitalists. Now that the new owners have a good title to all the patented ground of the Pennsylvania they intend to make such arrangements whereby it will be worked again. A good part of the ground contains a rich gravel bed, and it is believed by old miners that if it was worked for gravel alone it would pay handsomely.

Plumas.

INDIAN VALLEY MINE.—Greenville *Bulletin*, Apr. 14: In consequence of necessary repairs on the wire ropes at the Indian Valley mine, the mill has been idle for the past month. The ropes gave way and it became necessary to purchase new ones or repair old ones. The latter course was pursued. An experienced hand from San Francisco worked twenty-nine days repairing the two ropes, which are now considered nearly as good as new. The rope has been put in place and the hoisting of ore resumed from the chute out of which quartz was being taken at the time the mill stopped. Crushing was resumed Monday and the mill is expected to run regularly. The shaft has been sunk about 50 feet by Messrs. Skinner and Taylor. A "station set" of timbers have just been put in, and the sinking of the shaft will continue for another 50 feet. The progress now made is about one foot per day. A Burleigh drill is now in the shaft, also in the Union drift, which is going ahead at the rate of about twenty-four feet a week. The breaks caused by the heavy storms of winter, have been repaired and the mine is in good condition for regular and

successful working. The contractors have done good work.

GRANITE BASIN.—Plumas *National*, Apr. 10: Mr. Rockefeller and Mr. W. Wright have come into the Basin. They will commence to get the mill and mine in good running order, and will start up in good shape as soon as the snow goes off. J. J. Hall has returned from his trip down with bullion. The mill is running steady under the care of the Basin's most successful amalgamator, Joe Peppin. Arthur Christie's lower tunnel is in over five hundred feet, and in very rich rock. He is going to crosscut to his other ledge, which lays about forty feet to the right. The gold is coarser than in the upper tunnel.

San Bernardino.

CALICO DISTRICT.—Calico *Print*, Apr. 11: Robt. Anderson and his partner, E. Somers, of San Bernardino, have started a level in a 100-foot shaft on the Young Waterman at a depth of 35 feet, and are drifting both ways on the ledge and also crosscutting. One of the drifts along the wall will intersect another shaft which is down 100 feet. Judging from present indications Mr. Anderson expects to strike a rich body of ore before he proceeds much farther. This mine has been a continued source of profit to its owners, as well as to the chloriders who have at times had leases on the same. During the past few months the owners' one-fifth royalty amounted to about \$250 per month, and the mine has yielded them, over all expenses, about \$3,000, on the strength of which Mr. Anderson some time ago took a trip to Europe. This mine is among the most promising of West Calico. The Tibbets' Bros., who have a lease on a portion of the Young Waterman, are chloriding and taking out a few sacks of very good ore each day. Mike Welch also has a lease on this mine and is running a tunnel which is in about 15 feet and is extracting about a ton a day of good ore.

SUE MINE.—This mine is owned by Waterman & Porter and J. B. Osborne, who have 18 men busily engaged in drifting, stoping, tunneling and sinking. Two teams are daily engaged hauling ore to the Waterman mill from this mine. The main shaft is down about 160 feet and the main tunnel is in about 400 feet. A considerable quantity of ore has been taken out and there appears to be an unlimited supply yet remaining. The mine is being worked in first-class order under the foremanship of Jos. Hoskins. There are about 15 men chloriding on this mine, none of whom are making less than ordinary wages, the majority averaging three or four times that amount. Wm. Reed (the dancing master) and Amos Elliott have a lease on the Bedford Forest in West Calico, a claim owned by Wm. Reed, owner of the Humbug mine. They are drifting and taking out from 2 to 2½ tons a day of very rich rock which runs as high as \$100 to the ton. From present appearances these gentlemen are pretty sure to make a handsome stake out of their lease. Waterman & Porter have six men at work sinking and drifting on the Jessie Tay, who are taking out very good ore which is hauled to the Waterman mill. There are also four men chloriding on this claim who are doing well. There are a couple of men chloriding on the Josephine.

VERO.—This mine is located in the same belt as the Occidental in Northeast Calico, and is owned by H. I. Seward and the proprietors of the Grange Store of Los Angeles, and others, and has been worked principally by chloriders since its first discovery several years ago. From \$15,000 to \$20,000 have been taken out of the mine, while no considerable depth has been attained. It is still a good proposition for chloriders, some of whom are realizing from \$6 to \$10 a day to the man above expenses. Were sufficient capital invested to open up the mine in good shape it would reach a great depth and yield a handsome percentage on the investment. The other day the force on the King mine was increased by twenty men. This mine is looking well and it is the intention of the company in a few months to put on a larger force than ever before, just as soon as the mine can be put in such a condition as to advantageously accommodate them. Undoubtedly the company will be obliged to increase the capacity of their mill this fall, and it is reported that they intend to do so. The Burning Moscow, owned by the Oro Grande Co., has six men at work, two of whom are starting a shaft to find the walls to the ledge, while the other four are at work on the 50-foot level of the 140-foot shaft, and are taking out considerable ore. There are about 700 tons of low and high-grade ores on the dump. This mine has a most promising future before it, and is in the same belt as the Silver King. Last Wednesday the Leaching Works started up again under the management of W. A. Sharp. Success has attended the operations of this enterprise so far, and a new method of reduction has thus been inaugurated in the camp which will utilize the thousands of tons of low-grade ore lying on the dumps of numerous mines, converting the same into bullion and augmenting the wealth of the camp. There are several men at work on the Alvord gold mine clearing off the dumps preparatory to continuing operations on a more extensive scale.

THE KING MINE.—Calico *Print*, Apr. 17: A few days ago the force on the King mine was reduced considerably owing to the lack of milling facilities. In an interview with Mr. Dedrick Bahten, superintendent of the mine, we learned that it is the intention of the company as soon as possible to add fifteen more stamps to their mill near Daggett. At present their mill is entirely occupied in crushing ore from the Waterloo, and there is enough ore in that mine to keep the mill in operation indefinitely. Mr. Bahten informed us that the King mine is looking well, but that it is necessary that the capacity of the mill be increased so as to enable them to crush low grade ore without assorting, and at a reduction of milling expense. It will not be long before a larger force than ever will be employed in the King and other mines belonging to the Oro Grande company. There seems to be a general impression among business men here that the liveliest times are yet in store for Calico, which will be brought about by the increase of milling facilities and the consequent employment of larger forces of men to keep all the stamps constantly dropping. McBride and Miller have 14 men at work on the Blackfoot mine and are taking out a large quantity of fine ore. They have two teams busily engaged in hauling the ore to the mill at Daggett. Three men are at work in the Kearsage, taking out some fine ore from a 24-foot drift from the main shaft. There are about two tons of

ore on the dump at present. This work is being prosecuted by Robt. B. McCullough, Stacy & Co. On the south end of the same mine the Coleman shaft is looking fine. A large deposit of low grade ore has been struck in the same by Don. Craig & J. W. Coleman. Keyes & Noel, who have a lease on the Blackfoot, are doing well, and are taking out about half a ton a day of ore that assays well. The other day they shipped 5 tons to Holberg & Thede's mill. There now remains on the dump three tons. They have sunk an incline about 40 feet. Water has been struck in the Runover Co.'s new well, a mile or so below town, at a depth of 159 feet. As soon as it is ascertained that an abundant supply of water can be obtained the erection of a mill will be commenced. Peter Nichols and Robt. James have a lease on the Blackfoot and are sinking on the ledge, stoping eastward and taking out about a ton a day. They have shipped about 80 sacks to Barber's mill. The Lander Bros. are taking out some good ore from the Phoenix which is situated just below the Old Falls in the Oriental canyon road. Two men are at work driving in a tunnel, which is in about 20 feet.

ARROW GOLD DISTRICT.—Cor. *Calico Print*, April 17: Since last writing you I paid another visit to this district. I find that with development it is showing up all that I vouched for it. The Mexican mine has made several openings all showing rich ore. The Queen has a shaft down 35 feet showing a fine body of rich gold rock. Tom Jackson has a fine showing of free gold on the big ledge. Sam King the recorder is also opening the Relief which looks well. The Red Cloud shows a ledge of six to eight feet and the owners have about 50 tons of good ore piled on the dump. The survey of the railroad to Providence will bring Arrow camp within about eight or ten miles of railroad communication. There can be no question but Arrow will make a good gold mining camp.

MESCAL.—The Cambria mine of this place under bonds to Los Angeles parties is opening up well. The new tunnel 125 feet lower than the old one shows a large body of high grade ore. The owners would now be glad if the parties bonded would fail to connect.

IVANPAH.—This old camp still holds its own. Tom McFarlane has leased the Allys mine and is working a few men. Miller & Van Winkle are taking out some rich shipping ore from the Alps and several others are chloriding on various claims. The mill at present is shut down but will start up shortly.

Shasta.

MILL.—Shasta *Democrat*, Apr. 14: Nearly all of Tom Greene's new quartz mill is on the ground. The L. M. Mining Company of Squaw creek will have its mill running this week. We hear that two new quartz mills are being shipped to the Bullychoop mines. Levy Longfield has sold his quartz claim on Spring creek to San Francisco parties. Bell & Hopping's Huntington mill on their mine in Old Diggins district is running night and day. Davis, Warner & Co. have their tunnel in on the Clipper 60 feet, and rich ore is exposed all the way. J. O. Stewart, formerly of Copper City, is superintending the Manzanita mine on Sulphur creek, Colusa county. Jim Salee returned last Saturday evening from a brief trip to San Francisco. He informed us that he took charge of Iron mountain last Monday. The Croesus Mining Company has got its mill in running order and she works like a top. The storm that has prevailed for the past week has prevented them from laying their ore chutes, or they would now be running steadily. Tom Greene, who was down from French Gulch a few days ago, reported a rich strike that was made by two miners on a claim adjoining the old Washington mine. Samples taken across the vein, which is three feet in width, assayed \$800 a ton in gold. The ore is free milling. Vannoy is prospecting the Newton, which adjoins the Uncle Sam mine, and is exposing some very fine ore. Reidout's mine, adjoining the Snyder, is showing up splendidly. Fine prospects have been struck in several places on the Consolation lately. This claim joins the Clipper, on the east. Peter Shearer returned from San Francisco the latter part of last week and informed us that he has made arrangements with parties who will put up works on his mine. They propose to extract the precious metal by smelting the ore by a new process. Peter expects some of the machinery here in two weeks. Carson & Snyder have driven their tunnel in 150 feet, which gives them from this point to the surface a raise of 140 feet. At this point they crosscut the vein and exposed ore that will mill all the way from \$100 to \$2,000 a ton. It is a splendid strike for Squaw creek, and proves at least that this vein carries rich ore as depth is attained. At this depth they can show as rich rock as can be produced from any mine in the county.

Trinity.

DEADWOOD.—Cor. *Trinity Journal*, April 17: All the mines are flourishing and everything prospering. All the arastras are in full bloom. Mr. J. F. Dolliffe is crushing his ore in Jacob Paulsen's arastra, and John and Stewart Gibson have both their machines running in good order crushing ore from the Little Gem and Blagrove mines. Next is the Frick & Davis arastra, run by the esteemed engineer Daniel Goon. The next is that of J. R. Boles, which spins around in its lively course. McDonald and Brown Bear stamp mills are rattling away in a business-like manner, and thus in the latter part of spring will Deadwood turn out her share of bullion. All the mines are doing well. VanMatre Bros. are prospering in their little bonanza, having plenty of good ore in sight. Wm. Elgrave is also doing as usual; neat dividends are constantly the result of this mine. Billy McLiman and J. Kemp are the discoverers of a rich strike on the A. B. mine. A trip to Eastman Gulch last week found that little district in a prosperous condition. Bob Hamilton and Joe Gifford are working away industriously on a very bright prospect. They have had a clean-up recently which proved very satisfactory. There are other mines in Eastman Gulch which are doing well, and it may not be long before Eastman Gulch will be up in the "tens."

NEW RIVER.—Humboldt *Standard*, Apr. 14: Mr. J. S. Thomson arrived in this city Thursday evening from New River, and reports everything there in a flourishing condition. He says that the rains have delayed operations considerably, but that things are being straightened out in shape, and that it will not be long before the camp will present a lively appearance. At present there are

about one hundred men there, all of whom are working. Employment could be found there for many more men if they would seek for it. Several of the mines have started up but others have been delayed, owing to the water in them, but this will soon be overcome, and they will soon be running. There were five assays at work when Mr. Thompson left, and the prospects are good, some of the cleanups showing good results. The Mountain Boomer made a cleanup just before Mr. Thompson left, and showed an average of \$183.50 per ton. He is confident that when the mines get fairly started the results will be satisfactory to all interested. New River is like every other new mining camp. It started with an immense boom, and everybody expected to make large fortunes, but a reaction came and then the cry was, "There's nothing in it." But let things get down to a solid working basis, and there is no doubt that the New River mines will be a source of profit to many.

FROM WHITE ROCK.—H. Smith, who came down from New River with J. S. Thomson, gave us the following items concerning the mines: All are running and no ore has assayed less than \$20 and some has panned on \$138.50 per ton. This latter was Mountain Boomer ore. Weather has been fine, little snow has fallen, one fall being 16 inches but staying on the ground only a short time. Mr. Soule has made a rich find at the Oro Fino mine which claim he has leased, and Chas. Hanson and James Gulick have also struck a rich ledge, which is an extension of the Grover (Cleveland) mine. Geo. Dean built a two-stamp mill in a house but had to tear the house down to get it out. The Mary Blaine mine is covered with snow. John Toms, wife and four children arrived from Kettle-snake a few days ago. The distance is about 20 miles, and the family all walked, the age of the oldest child being fifteen and the youngest seven. We gathered from Mr. Smith's remarks that there is great confidence in the future of New River and that between 75 and 100 men are there. Little prospecting is being done in the adjacent country, operations being confined to New River.

Tuolumne.

ROBBED.—Tuolumne Independent, April 17: On Friday night of last week the mining claim of Shepard & Moss, at Dragoon Gulch, was robbed. The ground on which the claim is located is leased of Mrs. M. McCormick. The run had been for five days, on some of the best ground, and the claim had been paying good wages previously. It is not known how much gold was stolen, but they must have obtained considerable; as, where they had washed down the sluices, a streak of gold was left all the way. The ground-slucie was not touched, as there was too much dirt in it to move in a limited time.

NEVADA.

Washoe District.

HALE AND NORCROSS.—Enterprise, April 17: The fine ore body being developed in the explorations above the 3100 level shows better at the present writing than anything heretofore found at that depth, and as before remarked, it promises to materialize into a genuine old-time bonanza. It is being followed upward and northward—upward four sets of timbers, and northward six sets. The best ore, which is carefully selected and sacked, assays up in the hundreds, and yesterday, to the extreme northward, it was looking better than at any other point. The character of this ore is also more favorable than in the levels above, being of the loose, sugary, fertile character of pure sulphate and chloride, free milling ore peculiar to the rich bonanzas which have been worked out at either end of the great lode, yielding their numerous millions. It certainly is a very favorable and encouraging circumstance for holders of Savage to contemplate, as showing a tendency to run into that mine and perhaps make its bonanza culmination there. It is also of important significance as showing superior ore at the lowest depths and indicating what may be found by the deeper explorations already inaugurated. On the 2900 the north lateral drift is progressing well, and about to-morrow will arrive at a connection or intersection with crosscut No. 4, where the best ore on that level was found last summer, before the flooding of that and the other lower levels.

POTOSI.—The main south or southeast lateral drift last evening was in 347 feet from the Chollar south line, or 457 feet from the switch at the west drift from the Combination shaft. The drift is still running in the foot-wall formation along the west side of the ore vein, in dry, favorable working material, and the proposition is to continue it through to the Bullion line before stopping.

ALTA.—The main south lateral drift on the 700 level has now run into the Benton ground about 100 feet. It is being headed toward the old workings of the Lady Washington mine, and has about 150 feet further to run in order to connect. Some pretty good ore was formerly met with at that point, which will bear further investigation.

GOULD AND CURRY.—On the 630 level the crosscut west is still running in vein porphyry, not having reached the main ore formation. The lateral drift south or southeast is in quartz, and its face is within 100 feet of the Savage north line. Good progress is being made, and all prospects are encouraging.

BEST AND BELCHER.—Good regular progress continues to be made reducing the water in the Osbiston shaft, about five feet per day being made. But little over 100 feet of water remains to be raised in order to reach the bottom of the shaft. This will take six weeks, after which sinking the shaft deeper will be the proposition.

CON. CALIFORNIA AND VIRGINIA.—About 380 tons is the regular daily yield, giving an average assay from battery samples at the mills of about \$14 per ton. The explorations on the 1400 and 1650 levels continue making excellent progress, with no new features of particular interest to report.

SIERRA NEVADA.—On the 520 level the west crosscut makes good progress considering the hard dry nature of the rock, which is quartzite and vein porphyry, working unfavorably. Some \$40 ore is being extracted and milled from the croppings of the mine on Cedar Hill.

MEXICAN.—The 500 level operations having been abandoned all work is concentrated upon running the joint Mexican and Union drift on the 700 level. This is now in 675 feet. Material in the face, vein

porphyry, with streaks of clay and quartz.

UNION CONSOLIDATED.—An east crosscut has been started at a favorable point on the 500 level during the last few days. It is running in vein porphyry at present, but will probably strike something better shortly.

CROWN POINT AND BELCHER.—About 380 tons continues to be the daily yield, mostly from the upper workings, yet a large amount is hoisted from the 1500, 1600 and 1700 levels.

CUOLLAR.—Sinking the Combination shaft deeper is not contemplated at present, or until the explorations of the Potosi ground through this mine on the 3100 level are completed.

OPHIR.—On the 400 level the principal work has been the easing up and repairing of the timbering. Nothing new on the 300 level. Work going ahead as usual.

YELLOW JACKET.—Daily yield about 130 tons from the old workings above the 1300 level. Nothing new to be mentioned in any part of the mine.

KENTUCK.—About 50 tons per day continues to be the daily yield, keeping the Rock Point mill steadily employed.

Columbus District.

HOLMES.—Candelaria True Fissure, Apr. 17: We are still working in the McCuen ledge, near the old Northern Belle 7th level. The ledge is small, but is producing some good ore. In the 8th level we are stopping ore from the Morris ledge. This stop is not as large as it has been, a portion of the east end having been broken through to the drift. Sixty feet below the Morris we are taking a large amount of ore from this stop. From the 8th we have drifted west and connected with the 1st winze that was sunk by the General Thomas Company ten years ago. Where we made this connection we have a good development from which point we are extracting ore and sending it to the mill. We are also sinking below the 8th to connect with the 10th. The gypsum ore body in the 8th stop is still producing well. In the eastern end of 8th level we are drifting east to connect with the ore body in top of 9th raise. We have driven the main 8th east a distance of 30 feet during the past week. It still has 120 feet to go to reach the point where we are working in the ore. In the drift from raise above 9th level we have a good body of ore. It is fully three feet wide and the ore is good. It will average fully \$100 per ton. This is an entirely new country and 200 feet east of any work done at this point.

MR. DIABLO.—The stop above the west drift on the 4th level looks well and is giving some \$60 ore. We are getting some \$40 ore between the 3d and 4th levels west of the shaft. Between the 2d and 3d levels east of the shaft we are taking out a small amount of \$100 ore. The intermediates between the 1st and 2d levels are giving \$40 ore.

Cortez District.

BULLION HILL.—Cor. Eureka Sentinel, Apr. 14: During the past few days there has been some stir here over the discovery of a very promising ledge in Mill Canyon, close to the Berlin mine. The ledge is twelve inches wide at the outcrop, and has been stripped about 20 feet. It is a contact vein. The hanging wall is blue lime, and the foot wall a sort of quartzite. The lucky discoverers are James W. Campbell and W. Morgans. The ore is of a peculiar character. Nothing of the kind was ever before found in this camp. No one here was able to say what it was. He sent four samples of it to Mr. Clark, of the Garrison leaching works who assayed it, and obtained the following results: No. 1 went \$453.18 per ton, No. 2 \$396.74, No. 3 \$96.64 and No. 4 \$49.78. H. S. Smith and R. S. Young are running a chute from the main works to the upper tunnel for air. John Silver is extracting some fine ore from the Lone Star. W. A. Earles is sinking the main shaft of the property. W. Lewis is doing assessment work on his locations. Thomas Gilman has resumed work in his mine with a force of three men, himself and his brother.

Eureka District.

ORE.—Sentinel, April 12: Fourteen tons of ore were shipped in from the Iron Clad mine, Secret Canyon, to the Eureka Co. reduction works on Wednesday last. Eleven tons of ore were shipped during the past week to the Eureka Co. reduction works from the Frazier and Molino mine on Adams Hill. Ore shipments from the Adams Hill mines to the two reduction works in town continue. During the week ending yesterday 19 tons were shipped to the Eureka Co. works from the Paul Pry, and 23 tons from the Wide West. From the Lord Byron mine on Prospect Mountain 6½ tons of ore were shipped to the Eureka Co. furnace the other day. From the Dunderberg mine, owned by the same company, 30½ tons were shipped during the week ending yesterday.

Hawthorne District.

LAPANTA.—Inyo Independent, April 17: The owners of the Lapanta mine, near Hawthorne, say they have already taken out gold enough from the mine to pay back the purchase price of \$35,000, and pay a handsome dividend beside. The mine is now reported looking better than ever. The last shipment was a bar worth \$10,000.

Kirman District.

TO BE DEVELOPED.—Virginia Chronicle, Apr. 14: Owners of mining claims in Kirman district, on the western slope of Mount Davidson, are making preparations to develop their properties as soon as they can get supplies and lumber for timbering on the ground. Mr. Kirman, owner of the Norrie mine, is waiting impatiently for the ground to become firm enough to admit of hauling timbers to be used in the shaft. As soon as lumber can be got there he will put a shaft on and resume sinking for the body of the vein, the apex of which was cut at a depth of 135 feet below the surface. The bottom of the shaft is in vein matter, and the owner is confident that the vein itself will be cut before sinking 50 feet below the present depth. He is a firm believer in the infallibility of the power of the divining rod, in the hands of Mr. Norrie, as an indicator of the presence of minerals held in the bowels of the earth. He has already invested \$25,000 to prove the truth of the theory, and is willing to back his faith with four times that amount. Mr. Kirman says he puts up his own money in the enterprise and gives employment to a number of men, and therefore the public have no right to denounce his efforts to develop a mine as Utopian or visionary until he has demonstrated the truth or falsity of his theory. Mr. Thos. Reynolds, the hide dealer, has a location on the plateau a short distance northwest of the Norrie,

and has sunk a shaft 20 feet. He will send it down 200 feet the coming summer. This mine will be operated by an incorporated company. It was located on the authority of the divining rod, which, in Mr. Norrie's hands, is said to have indicated the existence of a valuable mineral deposit about 200 feet below the surface. Numerous other locations have been made in the district, numbering 20 or more within a radius of three square miles. The owners of several of these are now on the ground developing their property.

Revelle District.

MILL.—Belmont Courier, April 12: The mill at Revelle will make quite a run this summer on ore from the mines of that district, and as they are of a high grade the run is almost sure to prove satisfactory.

Taylor District.

STARTING UP.—White Pine News, April 16: The Argus mill, after a suspension of six weeks, during which it was put in tip-top order, started up Thursday evening. From this on the bullion will flow out.

Tuscarora District.

BELLE ISLE.—Times Review, April 16: North drift from the east crosscut, 450-foot level, has been extended 21 feet. Joint Belle Isle and Navajo crosscut, 150-foot level, has been extended 21 feet.

GRAND PRIZE.—The north drift on the 200 has been extended 20 feet during the week, and a drift has been started east from it. Upraise above the 200 lateral is up 33 feet. Stopes at present are looking poor and not producing much ore.

NAVAJO.—Crosscut No. 5, east lateral vein 350-foot level, has been extended 16 feet. North drift on the east vein, No. 5 crosscut same level has been extended 8 feet. Crosscut No. 2, 250-foot level, has been extended 6 feet.

Washington District.

ORE.—Shaw is still working his mine in Washington district, and Chas. De Long is taking some fine ore from his location there.

ARIZONA.

ALUM.—Clifton Clarion, Apr. 14: We had occasion to mention some time ago the discovery of an immense deposit of alum on Chase creek, and on the line of the Coronado railroad. Our reporter visited the scene of the find last Saturday in company with Messrs. Van Hook and Campbell, two of the interested parties, and learned by personal observation that the half had not been told. The entire face of the mountain or bluff, for a distance of 500 feet or more in length, by a couple of hundred feet in width, and nearly 160 feet in depth is a solid mass of alum, at many places occurring in a nearly pure state, and in others being highly impregnated with copper. It exists in quantities sufficient to supply the world for centuries.

TOMBSTONE.—Democrat, April 16: The most noticeable fact, and at the same time encouraging, is the increased prosperity of a large force of chloriders at work on outlying properties, all of whom are making money. Another encouraging feature is the gradual increase of force on nearly all the working properties, as well as the resumption of operations on several properties, which for some time past have been unworked.

TOMBSTONE MILL AND MINING CO.—This company still leads the van as an employer of wage workers. Since last report nothing of importance has transpired except the putting to work of a number of extra miners, and Superintendent Cheyney informs the reporter that others can also shortly obtain work there. The main output of ore continues to come from the Troughnut, something over 2000 tons monthly being reduced at the Girard mill. As before stated in these columns, the company are working ten or a dozen different properties.

LILLIAN.—This promising property, which was only located the first of the year, is developing splendidly. The strike which first brought it into notoriety, at a depth of 50 feet, is of greater magnitude than at first supposed. The shaft is down 65 feet, still in ore, but no drifting or crosscutting has been done. The owners of this property, who recently paid \$4000 to quiet title, have since taken out several times that amount of ore.

MARGARITA.—The strike recorded in last report is being vigorously worked, and a good deal of fine ore, running upwards of \$150, is being raised. The main shaft is down 60 feet, from whence a drift is being run on the ore body.

LITTLE GIANT.—Work progressing as at last report and with continued good results. The main shaft is down 85 feet, from whence drifting on the ledge has been run for 60 feet, all in ore.

RANDOLPH.—Not much is being done on this property, which bids fair to prove a big manganese proposition, as well as a good silver mine.

GRAND CENTRAL.—Usual amount of 40 tons being raised daily and sent to the mill.

COLORADO.

POVERTY GULCH.—Elk Mt. Pilot, April 14: The Augusta mine in Poverty gulch will, as soon as the snow permits, be operated. It produced last year ore of the value of \$47,000, and that too, at a great disadvantage, as all the ore had to be packed about five miles on burros, and the company was at the same time engaged in constructing a tramway from the mine to Pitsburg. This latter work was interrupted by a severe storm when almost completed, and as they had relied upon its completion to get winter supplies to the mine, they had to close down. We are informed that some damage to the tramway by snowslides during the winter has been done, and a portion of the ore house at the foot of the tramway also carried away, which will necessarily delay active operations for some time after work has begun. The Excelsior mine in the same locality, and now worked under lease by A. K. Chamblin and John Alexander, is also a property of which we may well be proud. It was worked under lease last year and shipped ore of the value of nearly \$12,000, and will no doubt exceed that amount this year. This mine, as well as the Augusta, will make a record this summer which will be a credit to this section. The Lakeside, another property in Poverty gulch, has received considerable development the past winter at the hands of J. C. McQuarrie, who did the work for an interest in the claim. Mr. McQuarrie is mashing on the shape of the Lakeside lode and thinks it will

eventually rank with the Augusta. So far, this property has made no shipments of ore, but it has some good ore in sight this spring and will probably make some small shipments. A contract has just been let on the Buffalo on Cascade mountain, in the same vicinity with the Augusta, Excelsior and Lakeside. It is controlled by ex-Postmaster Sidney Selover, and is said to be a fine prospect.

IDAHO.

LUCKY BAR.—Wood River Times, Apr. 14: Messrs. Rorem, Taylor and Furey spent a whole day with assistants, in panning samples from various parts of the claims. All with the uniformly excellent results already obtained. The dirt goes from five to ten cents to the pan, and higher. Whether it will do as well on a large scale, however, remains to be demonstrated. That has been the difficulty heretofore. The gold could not be caught because too fine. As the company intends to use burlaps, however, it expects to succeed. Sheriff Furey says that, close to the bank of the river, the pay dirt shows up fully five feet thick. The rich streak is about ten to twelve inches thick, and underlain by a loose gravel that will doubtless yield equally with the richer streak above, as the ground is much more favorable to work. Take it all in all, Sheriff Furey says, he never saw or heard of such rich ground as that under consideration. Whether it will pay to work on a large scale, with machinery the expense of running which will amount to fully \$100 per day, remains to be demonstrated.

NEW MEXICO.

SOCORRO NOTES.—Bullion, April 16: Col. David Branson, who was in this city last week, is dumping a most excellent fluxing ore from the Humboldt Mining Company's property in the Black Range. Haase, Ott & Co., owners of the Water Canyon concentrator, have decided not to increase the capacity of their present plant. Col. E. L. Mann continues to develop the north extension of the Silver Glance, in the Limar district, with no small prospect of ultimately reaching pay rock in important quantities. W. Cook and C. A. D. Conklin have leased the Mackay, in the Pueblo district, and are raising pay dirt continuously. They are preparing to ship their product to the Billing works, in this city. Walter C. Hadley supercedes F. M. Endlich as manager of Sierra Grande Mining Company. Major J. B. McGee and F. M. Melick went to Kelly on the 10th inst., and paid off the boys working on the Graphic and Grayhound mines. At the close of this month the working shifts on these properties will be reinforced. Mr. Gustav Billing has purchased some valuable mining properties near Silver City. They will be superintended by H. Huber, superintendent of the Kelly mine. This is a guarantee that they will be explored *tout de suite comme il faut*. Abeyta Montoya and F. A. Manzanarez will, the coming month, commence extensive development of their valuable mining properties in the Socorro mountains. These claims have ore in place and it is sufficiently high grade to pay a handsome revenue, if raised in sufficient quantities; it consists of both milling and smelting ore. E. H. Patterson's Broadgauge claim in Cat Mountain district, situated 11 miles west of Magdalena, is worked in shaft No. 2. This opening is now 22 feet deep, and makes on its bottom a fine showing of silver-bearing quartz, which also contains gold. Mr. Patterson will sink without loss of time an 80-foot shaft on the west end of this claim, 800 feet distant from the former working. At this point the mineral assays so well that he feels encouraged to prosecute systematic developments. The Sierra Grande Co.'s lixiviating works at Lake Valley, are running smoothly, and are saving 87 per cent of the value of their mineral. This value has increased to date about one per cent on every hundred tons of ore handled, and the enterprise, as a whole, is a complete success, aside from the failure of the machinery to do its work, which is due to too much economy in original construction; but a small additional expenditure on the machinery will increase the capacity of the plant to 100 tons per day, at a total cost not exceeding \$4 per ton.

OREGON.

GOLD HILL.—Cor. Granite Pass Courier, April 16: Boyd & Johnson, our persevering prospectors, are developing a valuable piece of mining property three miles south of here, in the Blackwell hills. G. F. Dyer, the mining expert, has gone to Portland for the purpose of purchasing a quartz mill, which he intends to have running in a short time. Thos. Chavner has agreed to donate land for a mill site and water privilege free. John Swinden has the best quartz ledge in Jackson county. The rock will speak for itself; there is gold in all of it, and in places it will yield from two to three hundred dollars to the ton.

UTAH.

REVIEW.—Salt Lake Tribune, April 17: The receipts in this city for the week ending April 14th, inclusive, were \$183,920.48, of which \$123,510.87 was bullion and \$50,409.61 was ore. For the previous week the receipts were \$77,868.87 in bullion and \$21,579 in ore, a total of \$99,447.87. But part of the ore receipts reported this week properly belonged to the report of last week, and would have been included in it had the returns been received in time. The Ontario output for the week was, fine bullion, 2,775,970 ounces; bullion slags, \$1,408.31. No ore sales, the roads being impassable for shipments. The daily product for the week was 892,936 ounces of fine bullion. No ore shipped because of bad roads. Nothing is heard from the Horn Silver. The reports of the speedy reopening of the smelters of that company are probably premature, as the ore so far developed is not understood to justify it. Fine bar receipts here for the week were valued at \$55,242; base bullion, \$25,015. The product of the Hanauer smelter for the week was \$20,965; of the Pascoe, \$2,020. The Germania smelter, after a stoppage of two weeks for the annual cleanup and repairs, began shipments again on the 9th. It has enough ore on hand to supply the capacity of the furnaces till the roads get in condition for regular shipments. Its product since the recent starting up has been three cars of bullion, valued at \$8,423.38. Ore receipts here for the week were \$516; Queen of the Hills ore, \$3,710; silver and lead, \$5,090; lead and silver, \$41,093.61.

IMPORTERS AND DEALERS IN

ASSAYERS' MATERIALS, MINE
AND MILL SUPPLIES,

CHEMICAL APPARATUS AND CHEMICALS, DRUGGISTS' GLASSWARE AND SUNDRIES, ETC.

114-118 Pine Street, - San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price. Our New Illustrated Catalogue, with prices, will be sent on application.

Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England. Also for E. G. DENNISTON'S Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dswey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dswey & Co.'s Patent Office Library, 252 Market St., S. F.

FOR WEEK ENDING APRIL 13, 1886.

- 339,865.—RIVING MACHINE—I. A. Davis, Englewood, Cal.
 339,911.—SELF REGULATING LAMP—V. Di Marzo, Benicia, Cal.
 339,761.—HARVESTER—Gillman, Frost & Foster, Santa Rosa, Cal.
 339,763.—HARROW, ETC.—O. Gravelle, Garfield, Nev.
 339,646.—WIRE ROPE AND CABLE—A. S. Hallidie, S. F.
 339,767.—FRUIT DRIER—A. J. Hatch, S. F.
 339,776.—TURNING JOWALS OF CRANK SHAFTS—W. J. Hogan, S. F.
 339,652.—SLATE WASHER—P. D. Horton, S. F.
 339,681.—TREATING CRUDE ALKALINE—R. G. Neuschwander, S. F.
 339,685.—FLY TRAP—J. Monroe Perry, Oakland, Cal.
 339,707.—MOLE TRAP—F. Stanke, S. F.
 339,950.—STEAM BOILER—A. W. Van Dorston, Portland, Or.

NOTE.—Copies of U. S. and Foreign patents furnished by Dswey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Mining Share Market.

There is nothing new to report concerning the mining share business. It continues exceedingly dull. The usual progress of exploration and development is being made in all the principal working mines. On the Comstock the re-opening of the old 600 level of Gould & Curry progresses favorably, and something good is very liable to be found there before long. The water is being fast reduced in the Osborn shaft, and bottom will soon be reached, after which sinking deeper will be the proposition. The low-grade ore resources of Consolidated California and Virginia, as well as at the south end in Yellow Jacket, Kentuck, Crown Point and Belcher, are being utilized for all they are worth, or to the full extent of the milling capacities. There are no idle mills now, and more stamps could be employed to good advantage. The outlook for a prosperous mining and milling run during the coming season was never better, and most certainly the winter and spring weather thus far betokens no scarcity of water, as was the case last fall.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Lapanta, April 17, \$10,000; Hanauer, 14, \$7290; Queen of the Hills, 13, \$1269; Hanauer, 15, \$5340; Pascoe, 15, \$2020; Alice, 16, \$12,131; Fitzhugh, 16, \$6743; Hanauer, 16, \$3145; Pascoe, 16, \$2030; Queen of the Hills, 16, \$1250; Hanauer, 17, \$3445; Queen of the Hills, 17, \$1280; Wells, Fargo & Co., Salt Lake, received for week ending April 16, \$81,773 in bullion; McCormick & Co., \$37,785; T. R. Jones & Co., \$49,516; Union National Bank, \$20,845; Oro Grande, 11, \$3164; Odessa Mill, 11, \$7800; Barber's Mill, 11, \$3500; Calico Mining Co., 18, \$5000; Oro Grande Mill, 18, \$5608; Odessa Mill, 18, \$4400; Barber's Mill, 18, \$3500.

New York Metal Market.

Telegraphic advices dated April 22d give the following New York prices:

ANTIMONY—Hallet's, 8½; Cookson's, 9½; in London, £34.10.
 BORAX—Silver—Fine is quoted at \$1.07½ per ounce. BORAX—California is selling at 6½ and 7½. The action of Congress on the duty on borate materials is anxiously noted by makers. A protest against any change of tariff has been forwarded by California manufacturers.

COPPER—Lake is quoted at \$11.50@11.62½. The market is quiet, with no changes of price. Lake stocks are light and set at 15,000,000 to 18,000,000 pounds, a large part of which is sold to manufacturers. There are numerous unfilled European orders in the market.

IRON—No. 1 American, \$17@18; No. 2, \$16@16.50. Market quiet and depressed, with product increasing. The weekly capacity of furnaces in blast is about 100,000 tons of all kinds per week.

LEAD—\$4.85@4.95. Market very quiet, with heavy offerings of both common and refined. Buyers seem to expect a decline in prices and are holding off.

NICKEL—Prices are nominal—70c.
 QUICKSILVER—Quoted at 43@43½.
 TIN—Quoted at \$20.70@20.80. Prices remain about the same, though the market is dull.

MR. J. F. Daly, whose business card appears in another column is a practical expert machinist who makes a specialty of perfecting experimental machines for inventors and constructing or manufacturing complicated or fine machinery. Mr. Daly's experience in this line makes him efficient and quick of conception to devise and originate needed parts and ways to proceed. At his shop may always be seen various newly completed inventions and many others in process of being worked out. He also furnishes estimates for building all kinds of machinery in quantities, and builds and repairs machinery of all descriptions.

THE Lake Superior copper mines are said to have very little copper on hand.

OPERA glasses for the Panama at Muller's optical depot, 135 Montgomery street, x

T PACIFIC ELECTRIC PAD
THE GREATEST DISCOVERY OF THE AGE!
Patented Jan. 16, 1886.
Best Retainer in Existence!
Gives perfect ease and comfort in all positions. Does not interfere with work or business. We guarantee a perfect cure of Rupture in all cases which we accept both of adults and children. Now, reader, if you are ruptured, this is worthy of your investigation. We especially desire all extreme cases, those difficult to retain and those considered incurable. If other treatment has failed you, come and see us. EVIDENCE UNLIMITED!
Our Terms: NO CURE, NO PAY.
CURES RUPTURE IN FROM 60 TO 90 DAYS.
Single Truss with solution, \$25. Double Truss with solution, \$45. Consultation and Advice Free. Write for full information and circulars. Office open every day.
WE GUARANTEE TO RETAIN ANY CASE!

CALIFORNIA ARTIFICIAL STONE PAVING CO.

(SCHILLINGER'S PATENT.)

—FOR—

**SIDEWALKS, GARDEN WALKS, CORRIDORS, OFFICES, CARRIAGE
DRIVES, STABLES and CELLAR FLOORS, KITCHENS, Etc.**

The Courts here and in the East have decided that Artificial Stone Pavements with plastic concrete and in detached blocks, are infringements on the Schillinger Patent; and also, that when the plastic material is hocked off with a trowel and cut through far enough to control the cracking caused by shrinkage, that such pavement is in law the same as if laid in detached blocks, and is an infringement of the patent. All property-owners having such pavements laid without the license of the above Company, will be prosecuted.

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be disconnected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.**

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS.
(\$575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco. As the result of a suit East against an End-Shake machine (the Eubrey), similar to the Triumph, the Frue Vanning Machine Company owns the Eubrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 13, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of \$1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Room 7—No. 109 California Street,

SAN FRANCISCO, CAL.

\$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

**THE
"TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "Triumph" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFLE TABLE, placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, hearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 Fremont St.,

San Francisco, Cal.

1850. 1885.
RANKIN, BRAYTON & CO.,
MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER OF INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY OF CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

THE JENKINS STANDARD PACKING

IS ACKNOWLEDGED BY USERS AS THE BEST in the world. Unlike all other Packings, the Jenkins Standard Packing can be made any thickness desired in a joint by placing two or as many thicknesses together as desired, and following up joint, it vulcanizes in place and becomes a metal of itself (it is frequently called Jenkins Metal), and will last for years, as it does not rot or burn out. Avoid all imitations, as a good article is always subject to cheap imitations. The genuine has stamped on every sheet "Jenkins Standard Packing," and is for sale by the Trade generally.

The Waring Pulverator.

We illustrate on this page a form of ore pulverizer which employs the principle of centrifugal force in an entirely new way. It is called the "Waring Pulverator," and its general construction and operation will be understood by reference to the drawings and the following description:

The material to be pulverized, previously broken to suitable size, passes into the mill at the openings to the left of chamber, Fig. 3, an automatic feed regulating and accurately measuring the amount. As soon as it enters the hollow bearing of the rotating chamber it is thrown outward by centrifugal force, and then by plows (not shown in the drawing) is delivered within the steel ring that forms the inner periphery of this chamber; here it is speedily reduced to powder by the centrifugal force of three steel rollers, *B*, pushed in a direct path around this steel ring by three other rollers, *C*, loosely journaled to the circular carrier, *D*, (keyed to the shaft *E*), so that in pushing the crushing rollers they revolve on their own axes.

Water is admitted through the center shaft and radial passage-ways in the carrier, *d*⁴, (Figs. 1 and 3) to these axes, *c*, thus constantly lubricating them and keeping them free from gritty matter. Additional water may be admitted through the pipe *E*³.

The discharge is by means of an adjustable scoop, *M* (Figs. 2 and 3), pointing in a direction opposite to that in which the chamber rotates. The degree of fineness of product may be regulated by changing the number of rotations of the chamber and by the distance at which the discharge scoop is moved from the center of the mill. The material removed from the mill through the scoop may be discharged at either the front or back—the gangue at one side and the concentrates, when they have accumulated, at the other.

In Fig. 1 *BBB* are the crushing rollers; *CCC* the pushing rollers; *D* carrier, keyed to the main shaft; *A*⁵ steel ring; *E* main shaft; *H* retarding pulley; *H*² driving pulley.

In Fig. 2 *M* is an adjustable discharge scoop; *M*² the handle for directing the discharge to either *N* or *N*².

Fig. 3 shows the machine used for the wet process. In the *I I* are the pulleys driving the shaft and carrier *D*; *B* is the crushing roller; *C* shows pushing rollers, loosely journaled; *M* is the adjustable discharge scoop.

As the material being pulverized offers a constant resistance to the forward motion of the rollers, whatever power is required to overcome this resistance is returned to the main shaft by the belt which passes over the chamber. This, the makers claim, amounts to a saving of about one-third of the applied power.

The centrifugal force generated by the rotation of the chamber, being much greater than gravity, causes the material to be evenly held against the entire inner periphery. This not only insures a constant and uniform action of the rollers and accounts for the enormous output of the mill, but also prevents unequal wear of the ring.

The manufacturers claim that the pushing rollers do not do any crushing except of the particles which trail between them and the free rollers—an amount just sufficient to prevent metallic contact. No iron, therefore, can possibly get into the product, as the pulverizing

FIG. 1.—SECTION OF WARING PULVERATOR SHOWING CRUSHING AND PUSHING ROLLERS.

FIG. 2.—SECTION OF PULVERATOR SHOWING DISCHARGE SCOOP.

FIG. 3.—WARING PULVERATOR ARRANGED FOR WET PROCESS.

is done altogether by impact, and the tendency is for the material to become imbedded into the rollers, merely causing them, though very gradually, to spread at the surface. The steel does not wear off any more than it would if rollers weighing from 1500 to 2000 pounds (the cen-

trifugal weight of each of the free rollers in the pulverator) were made to roll over the same material on a flat surface.

The dry mill is the same in principle as the one just described, the only difference being in the discharge arrangement. An exhaust fan induces a current of air through the machine, passing into the rotating chamber around the edges of the carrier disc. The current of air, after passing into an apartment wherein the great bulk of the material is separated from it, is returned to the chamber and used over and over again, avoiding waste of the very finely pulverized material and the annoyance and inconvenience from dust. It will be noted that no screens are used in either the wet or dry process.

The pulverators, both wet and dry, are made in three sizes, having crushing surfaces of 12, 24 and 36 inches in diameter, pulverizing from 500 to 6000 pounds an hour. Ingredients of different specific gravity may be discharged separately from different sides of the mill, and the fineness of product is readily regulated. Expensive foundations are not required, and one man can attend several machines. This pulverator is the invention of J. B. Waring, 26 Church street, and is manufactured at the well known Delamater Iron Works, foot of West Thirteenth street, New York.

Altitude of Placer Mines.

The secondary nature of gravel deposits in itself implies a lower average altitude than that of quartz veins, from which they are derived, though exceptions are met with in the case of veins unrelated to the drift matter or whose croppings have been largely cut down by erosion, possibly also where the conditions have been reversed by earth movements. The placer veins generally are at an average elevation of over 3400 feet above sea level, and those of the State are above an elevation of 2400 feet. The large number of shallow alluvial placers on the foothills and on the edges of the Sacramento and San Joaquin valleys, not on the lines of ancient river channels but redeposits from the latter, are at less altitude than the average stated, while the beach sands form the lowest group. The great drifts of the ancient rivers are in places from 1500 to 2000 feet above the present drainage system.

The order of succession of the deposits in point of time as well as in altitude is, first: the original quartz veins; second: the drift accumulated in the ancient river channels; third: the shallow alluvial placers, a redeposit or second concentration from the earlier drifts. Above the zone of the ancient rivers, in places, are found deposits of wash from the quartz croppings of recent origin; and, on the other hand, below the old river beds occasional accumulations of gravel are found, which are not redeposits from the latter, but are formed from the disintegration of veins which reach the surface at less elevation than that of the ancient channels. Placers are sometimes left on the summit of hills or mountains but this is the exception, not the rule. In this State some very important deposits occur on the crests of the foothills, and in Alaska the placers are nearly all found on the tops of hills—the result of glacial action. The highest placer in this country is in Alina Township, Park County, Colorado, which is at an elevation of 10,000 feet above sea level.

Mines About Smoky Valleys.—Park and Ophir Canyons.—No. 9.

[From Our Special Correspondent J. B. P.]

Park and Ophir canyons lie some 45 miles southeast of Austin, across a range of mountains, on the west side of Smoky valley. These are conspicuous and promising mining camps in this part of the State.

The ten-stamp mill in Park canyon, under the management of Mr. Trueman was not in active operation when we were in the camp, but was all in trim condition to start up in a few days. Large quantities of ore are now in readiness for the stamps, and the setting of a new roaster in addition to the one already in use, would render the appointments of this mill most complete. There has been a display of much honest, economical and ingenious enterprise on the part of Mr. J. B. Trueman to transplant this mill property to this point and to work it up into its present admirable condition. The husky thrift about this camp was very pleasant to witness and the outlook is of the most hopeful nature for the future. The property is operated by a company from Oswego, N. Y., some of the officers of which are among the writer's old intimates of college days of more than 30 years since, and are filling their places most nobly in the work of life.

At Ophir canyon some eight miles further south, on this same range, we found a very lively state of affairs. On the day previous to our arrival a new and rare discovery had been made in the principal mine on the third level, about 180 feet from the surface. This consisted of a solid and uniform sheet of ore, about two and one-half feet thick that heretofore in the old working of this mine had been left as a hanging wall, which it so completely resembled in its dark granite complexion.

An Accidental Discovery.

The nature of the discovery was purely accidental, rather than intentional. A large shore put for a support against a long stretch of this hanging wall, in an extensive cut-out, where ore in former years had been removed, was seen to be loose and serving no useful purpose and was ordered to be removed. In the removal a piece of this hanging wall fell in, and on inspection was found to be freighted with silver in large proportions, running, as afterwards proved, all the way up from \$800 to \$3000 per ton. The singularity, the richness and extent of the new find was reasonably calculated to arrest the attention of the whole camp, and when we arrived, the depth of feeling and excitement was of no ordinary cast. Mr. Oliver, the foreman, exhibited some of the samples of this new find, and the sight was sufficiently impressive to convince the most casual observer of the great wealth that was ensconced in those large masses of fresh ore. On the arrival of Mr. Jackson, superintendent and quarter owner of this mine on the same evening, we were urgently solicited by him to remain over until the next day, and go down into the mine for a general inspection.

Underground.

The next day, in company with Mr. Jackson, Mr. Oliver and several others, we had the pleasure of going through quite an accurate review of the mine. On the 31 level we came upon the new discovery, which fully corresponded to the description given, and in the center of which hanging wall (some 15 feet square), a miner on his scaffold, with drill in hand, was hard at work sinking a hole, preparatory to blasting off a few tons of this magnificent sheet of mineral. The blast was set off before we left the camp, we understand, but we did not have the pleasure of inspecting a great mass of solid ore which was brought to the surface by the aid of four or five miners. The dip of this hanging wall was in accordance with the other sections of the lode, in the mine, having a bearing of about 45°. A strong force was at work on the 5th level taking out some very fine ore. In fact, this mine which in former years has yielded several millions, has manifestly entered upon a new era of activity under the present management, and is now on the threshold of one of the husiest and most productive mining seasons of any mine in the State for this year. This mine has a twenty-stamp mill in constant activity, and another of ten stamps has been purchased to be set up immediately, to crush low grade ore.

Concentration.

The pulp of this low-grade ore is to be put through the Golden Gate Concentrator, such as is now used on the Brunswick and other mills on the Carson river. This Golden Gate machine, that separates the metal without the use of quicksilver, is bound to occupy a very conspicuous place in all the mining industries of this State, hereafter. In all intelligent mining circles it is the general subject of discussion, and several delegations from this part of the State have been sent West to look up its marvelous merits, and to introduce these machines here as soon as possible.

Fuel in abundance is obtainable at Ophir and Park canyons, whilst an extensive salt marsh lies directly opposite in the valley, furnishing

an ample supply of this material for all reduction purposes. The principal proprietors of this property are a Chicago company whilst a large share of the stock is owned by parties resident upon the ground. It is intended to push forward the works here with the greatest skill and energy, and to render this one of the best paying mines of the West. Mr. Graham, an old miner, and a very careful critic of mining interests in general, and who owns himself a mill property at the Tintic mines, Western Utah, was here on a visit, in behalf of the Chicago interest in the mine, and expressed himself in very encouraging terms respecting the future outcome of this plant.

The two miles of grand canyon leading up to this mine furnishes one of the most romantic pieces of scenery to be found in all the West, and Nature appears to have, indeed, furnished a royal gateway of access to some of her equally wonderful treasures. One of the most imperative needs felt here is speedy railway communication with the outer world, and the rapid growth of this and other adjoining camps will tend to hasten the time for the speedy consummation of such facilities.

Parallel End Lines.

EDITORS PRESS:—The Placer county Republican, referring to that portion of the U. S. mining laws, Sec. 388, directing that "the end lines of each claim (lode claim) shall be parallel to each other," apprehends that the directing law is insufficient and "may occasion an absurd combination of circumstances." The editor gives an explanatory diagram as follows:

The dotted lines, extending from the adjoining corners of the representative claims, denote the locus of a possible conflict and consequently the lode or lodes of both locations must dip towards that locality, outside of their respective surface side lines.

The proposition is certainly interesting and I shall endeavor to demonstrate briefly that the law as quoted is eminently proper; in fact, a faultless requisite for the location and equitable limitation of lode claims.

The rather unusual, relative position of the two locations, owned by different parties, suggests the preliminary question, whether either or both claims are located upon the same vein; or upon intersecting veins. The United States law wisely do not recognize the old time "spurs and angles"—so it may be also asked, whether the vein of one location abuts that of the other?

Assuming that the two owners of the above claims endeavored to locate the same vein—the diversity of the respective end lines is not in accord with: "A location of a mining claim upon a lode or vein of ore, should be laid along the same lengthwise of the course of its apex at or near the surface, as well under the mining act of 1866, as under that of 1872. If located otherwise, the location will only secure so much of the lode or vein as it actually covers." And again, "Each locator is entitled to follow the dip of the lode or vein to an indefinite depth, though it carries him outside of the side lines of the location; but this right is based on the hypothesis that the side lines substantially correspond with the course of the lode or vein at the surface." (Mineral Lands, p. 335.) But it may have been caused by misleading peculiarities of surface deposits; ignorance or error of either owner; correction of error or speculative intent.

U. S. Law, Sec. 390, directs: "But their right of possession to such outside parts of such veins or ledges shall be confined to such portions thereof as lie between vertical planes drawn downward, through the end lines of their locations so continued in their own direction that such planes will intersect such exterior parts of such veins or ledges." The law is comprehensive and does not permit the subsequent locator to encroach upon the plainly conferred rights, conveyed by legally established surface lines to the prior location.

If either or both owners intended to or did locate different or intersecting vein or veins, which may or may not abut the neighbors' lode or lodes, U. S. Law, Sec. 404, would be decisive: "Where two or more veins intersect or cross each other, priority of title shall govern, and such prior location shall be entitled to all ore or mineral contained within the space of intersection; but the subsequent location shall have the right of way through the space of intersection for the purposes of the convenient working of the mine. And where two or more veins unite, the oldest or prior location shall take the vein below the point of union, including all the space of intersection."

Through the hypothesis of the diagram, variegated and intricate complications are suggested, and more so if the locations are intended to cover the same vein, but non-compliance only with the U. S. mining laws and instructions thereunder will originate possible contention. The side lines of either or both claims may be

diagonal to the course of the vein claimed, and it may occur also that the prior location even would have to yield proportional precedence again to a still prior location whose surface lines may embrace a portion of the apex of the vein in controversy. Absolute compliance with the laws and priority are evidently sufficient, however, to determine contention that can arise only through the ignorance, error or perversity of one or both owners.

The diagram also suggests considerable depth of expensive explorations before the presumed cause for dispute can be reached. The law properly directs that lode locations shall be entitled to the vein located throughout its entire depth. The end lines constitute the necessary linear boundaries. If the end lines were not prescribed to be parallel to each other, what should they be? The locator must be aware, more or less, of the dip of his vein. If the law did not confine him to end lines parallel to each other the surface lines of the prior locator would resemble likely:

The longest side line would of course indicate the dip of the vein, and depth would spread his linear boundaries indefinitely. Equity would demand at least that outside parts of the vein, the apex of which lies inside of the surface lines, should be limited by lines drawn rectangular to the direction of the parallel surface lines. Will it obviate complications apprehended through surface and lines being parallel to each other?

F. SLECHER.

Placer Co., April 20, 1886.

Hints for Lubricating.

EDITORS PRESS:—Many who buy mineral lubricating oil in quantity do not like to keep them on their premises because of fear from fire. It is not generally known that mineral oil, even in small proportion, quenches fire, and so far from causing, arrests spontaneous combustion.

There is absolutely no record of fires caused by mineral lubricating oils.

But a late quarterly report of the Associated Fire Insurance Co. of Boston mentions among the list of fires one to which I would respectfully direct the attention of the oil-consumers of the coast. It was a fire in a cotton mill, caused by the spontaneous combustion of some cotton waste which had been saturated with a compounded neat's-foot oil! This fire led to tests at the Institute of Technology as follows:

Test No. 1: Two balls cotton waste, one saturated with pure lard oil, the other with pure neat's-foot oil. In four hours the first ball became so fiery with heat that it was withdrawn; the second ball stood the heat two hours longer. At the end of this time it was literally a fire-ball.

Test No. 2: On the principle of the "survival of the fittest," the lard oil was dropped from the series of experiments and a comparison of the neat's-foot oil with an equal mixture of mineral and neat's-foot was made. In this test the pure neat's-foot acted just as it had before, flaming at about 500° Fah. At this time (viz., after six hours' exposure to the generative heat of the apparatus) the waste, saturated with mineral oil, had but slightly changed its temperature. And even at the end of seven hours it had risen only to 214° Fah.

In test No. 3 the proportion of mineral oil was decreased to only 33 per cent of the mixture. This proportion, 33 per cent of mineral oil, kept the temperature of the ball of waste down to 214° Fah. for 6½ hours, and then showed no signs of char. It was regarded as absolutely safe. But in my next I will try to show the inutility of all mixtures of animal with mineral oil, having demonstrated in this, I think, the superior resisting power to heat of mineral lubricating oil and its perfect safety.

CHARLES J. WOODBURY.

AMERICAN MACHINERY IN MEXICO.—A letter from the city of Mexico encourages great expectations on the part of American manufacturers of machinery and implements. The writer says: "Labor-saving machinery has only begun to make itself known here, and there is plenty of room in that direction for American manufacturers. There is no such hostility to labor-saving machinery as is alleged to exist by misinformed people. The planters welcome any good machine which saves labor, but the drummer system of introducing such machinery should be abandoned. For example, an agricultural concern sends an agent here, who persuades planters to buy his machines. He goes out to the hacienda, sets up the machine and then goes away. The machine, being new, perhaps does not work well, or a part breaks, and it is impossible to get a duplicate part near at hand, and the planter becomes disgusted, and refuses to buy the next time an agent comes around. Local agencies serve better, for then the planter buys new machines in confidence that he can any time get some one to show how to repair it or furnish him with

new parts. All the established agricultural implement dealers here testify to the universal desire for labor-saving implements. Mexico is a big country, with a very inadequate population. Immigration comes here only to an insignificant extent. The solution of the labor difficulty is either the coolie or the machine, and patriotic Mexicans prefer the latter."

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FLY TRAP.—J. Monroe Perry, Oakland. No. 339,685. Dated April 13, 1886. This is a cylindrical wire gauze trap, bent inwardly at the lower end to form a cone, with a narrow slit for the passage of the flies. It is hung by hooks against a window, with the opening at the lower end. Flies crawling up the window will, on reaching the inclined angular part of the network crawl up on it until they reach the opening between the two edges, and then pass into the opening of the trap. It can also be set upon a table. The patent covers certain details of construction.

COMBINED HARROW, SEEDER AND ROLLER.—Octave Grevelle, Garfield, Esmeralda Co., Nev. No. 339,763. Dated, April 13, 1886. This combined implement consists in a wheeled frame, to which is pivoted arms which carry a harrow extending transversely under the frame. On top of the frame is a seed box which communicates with suitably arranged drills. Behind the harrow and under the rear of the frame is mounted a roller. The invention further consists in the mechanism by which the rotation is imparted to the harrow, and by which it is vertically adjusted; in the mechanism by which the seeding device is regulated and by which its drills are adjusted; in peculiar mechanism of which the harrow, the drills and the roller, are all elevated, so that the machine will travel on its three wheels, and in various details of construction.

FOLDING BEDSTEAD.—B. F. Farrar, S. F. No. 339,283. Dated April 6, 1886. This is one of that class of folding or wardrobe bedsteads in which a sectional bed-frame is adapted to be folded into and extended or opened out from a head casing, and the invention consists in a novel double or changeable fulcrum-connection and limiting stops between the bed frame and the head-casing, adapting the former to be easily handled; in peculiar plates or pieces hinged to the sections of the bed-frame and to each other, and arranged in such a manner as to form the top of the device when folded as a wardrobe and to form the support or transverse leg for the bed-frame when extended; in pieces on the top-plates serving as end guards when the bed is folded and as supports when the bed is extended; in plates covering and protecting the joint of the sections of the bed-frame and various details of construction.

HARVESTERS.—L. J. Gilman, C. W. Frost and C. H. Foster, Santa Rosa, Sonoma Co. No. 339,761. Dated, April 13, 1886. This harvester or header consists in the novel construction and mounting of the draper frame or platform and its connection with the main frame, whereby it may be kept always level for any cut, high or low, its limits of motion defined and regulated, and the whole frame evenly balanced; in the novel power-transmitting connection, by which the work of the machine is divided between the two wheels in substantially equal proportions; in the novel manner of adjusting the reel and in the inclination of its cross-bars; and finally, in the means by which the speed of the reel and the draper is regulated. The general object of the invention is to provide an easy working and readily-handled header, adapted to do its work without waste of material or loss of power.

WIRE ROPE OR CABLE.—Andrew S. Hallidie, S. F., No. 334,646. Dated April 13, 1886. This invention relates to wire ropes or cables composed of strands, which strands are themselves composed of wires. The object of the invention is to diminish or avoid altogether the wear upon the wires, due to their frictional contact with sheaves or other supports, or to the internal frictional contact of the strands with each other. The invention consists, first, of a wire rope or cable composed of strands, each strand formed of wires and covered with strips of flat metal wound about the completed strand. It consists further, of a rope or cable composed of strands formed of wires, so as to form a complete and smooth cylindrical strand, said strand being covered with strips of flat metal wound thereon. It consists further in interposing a thread or wire between the coils of the flat metallic strips wound upon the strands, to prevent chafing of the edges. It will be seen that each strand has a flat covering strip, as well as the complete rope formed of the strands. A covering thus applied to a finished rope protects the outer surfaces, and by applying the flat covering to the strands Mr. Hallidie protects the entire body of the individual wires, not only from internal wear, or wear by frictional contact, but also protects them from external wear.

MECHANICAL PROGRESS.

Lightly Loaded Engines.

The question of large or small engines, in proportion to the work required of them, has been much discussed of late in technical journals. The *Industrial Review* remarks that steam users, when erecting new power plants, are not uncommonly told that if only their engines are large enough, everything will be satisfactory, and that there will be a margin of power for future extensions. As this quite often accords with their ideas, they follow this advice, and are thus doubly unfortunate, as they not only lay out a much larger amount of money than is really necessary to begin with, but pay more money continually in running the engines afterward. A sufficiency of power is, of course, the first consideration; but it cannot be too widely known among those interested in the economical use of steam, that wherever the load to be driven by an engine tolerably constant, there is one size of engine, and one only, which will give the best result. For every engine, also, there is one definite load, whether the engine be condensing, non-condensing or compound, which will give a maximum of economy in working. Any deviation from this, in either direction, either by underloading or overloading, will result in a greater consumption of steam, and consequently of fuel. Another contemporary in commenting upon the above says:

"There are two principal reasons for the conditions stated above, one being mechanical, the other thermo-dynamic. The initial friction (friction without load) of a steam engine, when in good condition and well lubricated, is a fixed quantity, proportional to the size of the engine, but independent of the load, and the friction due to the load, be the latter ever so light, will also be to a certain degree proportional to the size of the engine, hence, in a large engine, doing little work, both frictions will be large in proportion to the work. Regarding the thermo-dynamical question, a certain rate of expansion is generally fixed as the most economical for a certain engine, and a deviation from it will cause an increased consumption of steam. It is well known that either throttling or an excessive rate of expansion, which would have to be adopted for a light load, will cause excessive cylinder condensation, and this has been especially experienced in compound engines, sometimes to such an extent as to make them more wasteful than the common single cylinder engine."

Heat Without Fire.

Inventors and experimenters have been busy for several years in efforts to devise some practical method of producing heat without fire—by chemical action or by the mechanical action of friction. Such a device would be of great value for heating railroad cars, especially for the reason that many frightful accidents from the burning of cars by the heating stoves which they now carry might thereby be obviated. A contemporary says: "Of course if people could get along without fire there would be no conflagrations and no use for insurance companies. Nevertheless, underwriters will be interested in a recent invention which claims to generate heat without fire and is said to have been successfully experimented with in the Hookett mills, N. H. The inventor is Prof. Webster Willis, of the Boston Institute of Technology, and he describes his 'friction heater' as simple in construction, consisting only of an iron cylinder one foot long and one foot in diameter, having a fixed plate of hardened iron in one end and a second plate attached to a revolving shaft, and pressed lightly or tightly against the fixed plate as circumstances require. The cylinder is filled with water, the shaft revolves, and from the friction of the plates the water in an incredibly short time is heated, and by means of pipes can be carried to great distances for heating purposes. The machine has been in practical operation for some months, and it is demonstrated that a machine with thirty-six square inches of friction surface will heat a room of 10,000 cubic feet better and quicker than coal, wood or steam can do it, and absolutely without expense, save the wear of the friction plates, and the pittance for extra coal under the boiler. By this apparatus there is no danger from fire or explosion, and wherever there is waste power which can be utilized in this way the heat is obtained almost for nothing. It is claimed that a heater requiring two horse power to run it will amply heat a room containing 60,000 cubic feet, the heater costing \$100. Of course, time and further experiment will determine how useful the invention will prove practically; but there are those who now believe in it, and a company has been organized in Boston with a capital of half a million to manufacture and introduce the apparatus. For cotton mills, steam cars and a variety of other purposes the security against fire will be a great consideration in favor of the invention."

AMERICAN BOILERS FOR SWEDEN.—Sweden is about to try two American locomotive boilers, which are being built by the Jackson Manufacturing Company, Scranton, Pa. Though made to Swedish drawings, the boilers will be of essentially American design, with iron flues, steel fire-box, Richardson pop safety valves and Monitor injectors. We understand that the

two boilers are to be delivered at Gothenburg for \$3500. As the boilers are smaller, this price is probably higher than that of a boiler made of similar materials in Sweden, but is lower than a boiler fitted with copper fire-box and brass tubes. The results of this experiment with steel fire-boxes will be awaited with much interest.

Heavy Crucible Steel Castings.

The English correspondent of the *American Manufacturer* says that soft steel castings are coming more and more into favor in the English Admiralty, and at private ship-yards. It is thought by many English iron masters that steadily but surely cast steel will, and must, take the place of both iron and steel forgings for marine purposes, and the orders seem to justify the expectations.

Mechanical devices for accomplishing the current and even heavier work are being set up, especially by Messrs. Jessop & Sons, who make such castings a specialty. They are now able to produce monster steel castings up to 60 tons in weight. They have two Siemens-Jessop furnaces whose producing capacity is 30 tons; and a third is nearing completion which alone will yield 20 tons; while in the old foundry steel as heretofore is melted in pots of about 80 pounds. The principle of combination is thoroughly understood at these works, and every advantage is taken of it.

The correspondent above alluded to asks if this country is doing all that it should do in this direction, and says: "I am tempted to inquire if United States steel-masters are laying themselves out with the alacrity which the occasion seems to demand for the production of machinery and marine castings? The Sheffield men, who have spent hundreds of thousands of pounds sterling in the business, evidently believe that there is money in it."

Speaking of the recent failure of English-made hayonets the correspondent says that \$200 per ton has been paid for "hayonet steel." This was the price paid by the English Government authorities for the crucible cast steel supplied by Sheffield firms for the hayonets which under test are proving so wretchedly incapable of rough work. The figure is from \$50 to \$75 per ton less than the Government paid some 12 years ago. Still it is a figure at which a thoroughly reliable cast steel can be obtained.

SIZE OF STONES IN MASONRY.—In many edifices, both ancient and modern, it has been observed that the stones used were too thin—i. e., that they had not sufficient thickness in proportion to their length, and that in consequence they broke under the weight. This accident arose from the stones not resting equally throughout the whole surface of their beds, either because these surfaces were not exactly dressed or levelled, or because some unequal settlement took place which deranged the lower stones. The greater the thickness given to stones relative to their length, the greater is the power of resisting this effect, which is very often difficult to foresee or prevent. For works which have very great weights to carry, such as walls and points of support, cubes are the strongest, but they have less ability and do not form sufficient bond; those in which the length is much greater than the height have more bond but less strength to carry the weight. According to the experimenter's made on stone, the length may be fixed at from twice to thrice their height, and their width from once to twice, supposing the stone of moderate hardness. When stones are very hard, more than a foot thick, and wrought on all sides, their length may be from four to five times their height, and their width from two to three times. Larger dimensions increase the expense without adding to the utility.

ENGLISH AUTHORITY ON AMERICAN LOCOMOTIVES IN BRAZIL.—A letter in *Engineering* (London) states that American locomotives have of late years been rapidly gaining favor in Brazil. A few years ago we hardly had an American locomotive in Brazil. Now most of the Brazilian companies prefer the Baldwin to any other. In the Government railway, the Don Pedro II., there are 118 locomotives. Of these only 18 are English, 1 Belgian and 1 French; 98 are American. In the next largest railway line, the Leopoldina, out of 25 locomotives in traffic only 9 are not American. And yet no political or other influence of the kind has determined the preference. The agent of the Baldwin works was an obscure American commission merchant, and at present the Philadelphia house is represented in Brazil by a most respectable English firm, that of Messrs. Norton & Megaw, who also represent Messrs. Lamport & Holt, the celebrated ship owners.

NEW POLISHING DEVICE.—S. W. Adams, of Chicago, Ill., is the patentee of a machine for polishing the interior of metal tubes. The machine contains a revolving shaft carrying a polishing head or disk at one end, and used in connection with a clamp composed of a sleeve having a split end and of a nut for clamping the split end of the sleeve on the tube to be polished. The emery-head is revolved rapidly within the tube, while the latter is being gradually carried forward. The shaft and the tube are rotated in opposite directions. Hot water is supplied to the tube by a hose nozzle which is being carried forward with the tube. The inventor states that long pieces of tubing may be nicely polished by this machine.

SCIENTIFIC PROGRESS.

An Interesting Scientific Discovery.

To Prof. Osborne Reynolds is due the credit of making a discovery which promises to be of some importance. The discovery appears to have resulted from experiment, guided as much by inductive reasoning as pure curiosity. It is, says the *Engineer*, a remarkable discovery, in that it was quite unanticipated, and is, indeed, apparently opposed to past experiences. Of course, it is not really opposed, for nature does not contradict herself; but the precise conditions necessary have never before been secured properly by a philosopher, though, no doubt, they have been present scores of times when the philosopher was absent. The discovery was referred to and described at a late meeting of the British Association. More full reference was made to it at a subsequent meeting held February 12th last.

A special word had to be coined to give a name to the discovery, and it will hereafter be known as "Dilatancy." The paper read by Prof. Reynolds was entitled, "Experiments Showing Dilatancy, a Property of Granular Material, Possibly Connected with Gravitation."

The Nature of the Discovery.

If we ask anyone what will occur if an India rubber bag containing sand and water, and communicating with a bucket of water by means of a tube, be pressed between two flat boards, the answer will be that the water in the bag will be squeezed out into the bucket. Broadly stated, Professor Reynolds' discovery is that this is not what will happen, but that, on the contrary, water will at once rise up the pipe from the bucket, and enter the bag. Paradoxical as it may seem, the bag becomes larger, up to a certain limit, the more it is squeezed.

Professor Reynolds began his discourse by telling his hearers something about the mysterious ether by which light is transmitted to us from the sun; by shearing which in two, according to Dr. Lodge, we get electricity; the possible cause of cohesion and gravitation; an elastic, homogeneous jelly pervading all space, more rigid, in one sense, a million times, than cast steel, and yet so tenuous that it does not sensibly retard the motion of planets moving through it. Whenever a phenomenon presents itself which cannot be otherwise explained, it is referred to the ether, and there are nearly as many ethers as there are philosophers. It has been said, indeed, that no less than six different ethers are needed to satisfy the predicates of the vibratory theory of light. Maxwell found no comfort in the ethers; on the contrary he maintained that they were like the glasses of the dram drinker—one always led to another necessary to explain the existence of the first. "As a result," says Professor Reynolds, "of a long-continued effort to conceive a mechanical system possessing the properties assigned by Maxwell, and further, which would account for the cohesion of the molecules of matter, it became apparent that the simplest conceivable medium—a mass of rigid granules in contact with each other—would answer, not one, but all the known requirements, provided the shape and mutual fit of the grains were such that, while the grains rigidly preserved their shape, the medium should possess the apparently paradoxical or anti-sponge property of swelling in bulk as its shape was altered."

No one ever dreamed that the cubic content of sand in a sack was affected by the shape given to the sack. Yet, now that we are told all about it, we wonder that we did not see the truth before. If the grains interlock, their alteration of form must, under given conditions, augment the space occupied. For, example, if we shake or disturb a brick wall, it is evident that we increase its dimensions, because the bricks are no longer so close to each other as they were. In an ordinary mass of brickwork or masonry well bonded without mortar, the blocks fit so as to have no interstices; but if the pile be in any way distorted, interstices appear, which shows that the space occupied by the entire mass has increased, as was shown by a model. Prof. Reynolds obtained the necessary conditions by using a thin India rubber bag holding six pints. This bag he filled with clean, dry sand, such as is used for hour-glasses, served for many experiments. The bag was coupled to one leg of a mercury pressure gauge, and it was only necessary to flatten the bag to make the mercury rise seven inches in the leg next the bag; in other words, a partial vacuum was established by squeezing the bag.

Without a knowledge of the property of dilatancy, such a method of producing a vacuum would sound somewhat paradoxical. Opening the neck to allow the entrance of water, the bag at once yields to a slight pressure, changing shape, but this change at once stops when the supply is cut off, preventing further dilatation.

Professor Reynolds has, as yet, drawn but few deductions. He prefers to continue his experimental researches, and some of the results are very curious. "Putting a bag filled with sand and water between two flat boards, vertically, and slightly shaking while squeezing so as to keep the sand at its densest, while it still has a free surface, it can be pressed out until it is a broad, flat plate. It is still soft as long as it is squeezed. But the moment the pressure is removed, the elasticity of the bag tends to draw it back to its rounded form,

changing its shape, enlarging the interstices and absorbing the excess of water; this is soon gone and the bag remains a flat cake with peculiar properties. The pressures on its sides it at once yields, such pressures having nothing to overcome but the elasticity of the bag, for change of shape in that direction causes the sand to contract. To radial pressures on its rim, however, it is perfectly rigid, as such pressures tend further to dilate the sand; when placed on its edges it bears 1 cwt. without flinching. If, however, while supporting the weight it is pressed sufficiently on the sides, all strength vanishes, and it is again a rounded bag of loose sand and water." By shaking the bag into a mold, it can be made to take any shape; then, by drawing off the excess of water and closing the bag, the sand becomes perfectly rigid, and will not change its shape unless the envelope be torn; no amount of shaking will effect a change.

In this way bricks can be made of sand or fine shot full of water, and the thinnest India rubber envelope, which will stand as much pressure as ordinary bricks without change of shape; also permanent casts of figures may be taken.

When we walk along a wet beach, around each foot-print the sand is seen to change color for some distance. This is because the pressure of the foot has changed the shape of the mass under it, and the water is sucked in, drying the sand all around. It seems a paradox that instead of squeezing the water out of that portion of beach rigid under foot, it is sucked in."

Possible Useful Applications of the Discovery.

The following has been suggested as the possible useful applications of this interesting discovery: "Although Prof. Reynolds has not drawn deductions, we cannot resist calling attention to one or two which suggest themselves. May we not find here the cause of rigidity? The bag of sand is stable, because to change its form would augment its bulk. May not a bar of steel be stable for the same reason? Our readers will not be slow, we think, to see that Prof. Reynolds has left a good deal to be explained. For example, to state that a cake of sand and water is stable because a change of form would augment its dimensions, is only to reason in a circle. We naturally ask, well, why should it not increase its dimensions, and to this Prof. Reynolds supplies no answer. It is true that an increase in volume would lead to the production of a partial vacuum inside, and that in so far the pressure of the air outside would tend to promote stability; but this stability ought to be elastic or dynamic stability, not static. Concerning this, no doubt, Prof. Reynolds will have more to say. The apparatus required is extremely inexpensive, and there is no reason why a whole army of workers should not attack this subject with excellent results. Meanwhile, we may say that it has long been known to engineers that sand, unlike water, exerts under suitable conditions no lateral pressure. For example, bags of dry sand have been employed instead of wedges to carry the centering of bridges. The loads may be very heavy, yet these canvas bags will not burst. If the sand behaved like a liquid, they would be rent in a moment by a hundredth part of the load. To strike the centers it is only necessary to open a small hole in a bag, and let as much or as little sand run out as may be needed. A paper plug will suffice to stop the flow."

EFFECT OF AIR AND WATER ON METALS.—Some researches of a valuable nature have been made by a French metallurgist into the comparative oxidizability of cast iron, steel and soft iron under the influences of moist air, sea water and acidulated water. With moist air it was found that in 20 days the steel plates lost from three grammes to four grammes for every two square decimeters of surface; chrome steel rusted more and tungstated steel less than the ordinary carburized steel; cast iron lost only about half as much as the steel and spiegeleisen less than grey iron. Sea water dissolves iron rapidly and acts upon it more powerfully than on steel; most powerfully of all upon spiegeleisen. In nine days the steel plates with two square decimeters of surface lost from one gramme to two grammes, while phosphorized iron lost five grammes and spiegeleisen seven. Tempered steel was less affected than the same steel twice annealed; soft steel less than chrome steel, and tungstated steel less than the ordinary steel with the same proportion of carbon. Acidulated water dissolves cast iron much more rapidly than steel.

A NEW ORDER OF METALLIC SPECTRA.—When, in observing the spark spectra of solutions of metals of the didymium and yttrium families, the liquid itself is made the positive pole, the upper surface of the liquid becomes luminous and gives a spectrum consisting of several nebulous but sometimes brilliant bands lying between 6205 and 4765. Boissaudran could not trace this spectrum to any of the known cerite metals, and he was unable to obtain it with solutions of the yttrium compounds. It is, however, identical with the bands given by the phosphorescence of pure yttrium compounds, as observed by Crookes, in high vacuum. The direct contradiction between these observations will be made the subject of further experiments. —*Journal of Chem.*

Passing Events.

The era of cheap railroad fares between California and the East has been closed for the present, but while it lasted it was of benefit to this State in bringing large numbers of desirable immigrants to our shores. The southern portion of the State has derived the greatest advantage, large sales of land in that region having been made.

As etated elsewhere in the PRESS, there is now a very good demand for gold mines in California. It must be borne in mind, however, that the capitalists who desire to purchase are not in the market for prospects, but rather desire developed mines, and preferably those which are paying a profit. They seem to want the miners to get them in this condition first and then they are willing to pay pretty good prices.

The water season this year will be a very good one, as the supply will last later than usual, owing to the large storage of snow in the mountains.

Drift mining is gradually growing in favor in this State, somewhat under compulsion, it must be confessed, hydraulic mining, in all except the extreme north, being prevented.

The decision of the Supreme Court enforcing the legality of riparian rights on streams, is looked upon with much disfavor by the majority of Californians, who do not believe that the principles of water rights adapted to English conditions, are fitted for a comparatively dry country like this, where, in order to carry on irrigation and mining operations, the water must be diverted from the natural streams.

The California Gold Region.

More attention is now being paid to the development of the gold quartz interests of California than ever before. The low prices of silver, lead and copper, the working out of placer deposits, and the cessation of hydraulic mining, have combined to turn more favorable attention to our gold quartz interests. There is an increasing demand on the part of capitalists for paying gold properties, this demand, however, being mainly confined to developed mines. Our gold regions are in a country where the climate is favorable and where means of transportation of material, etc., are at hand. The country is settled, centers of supplies are near at hand, labor is plentiful, and all the conditions are favorable, for a much more rapid development of the quartz industry than they have been in the past.

The great auriferous belt of California extends from the mountains bordering the Colorado desert on the south to the Trinity mountains on the extreme north, where it terminates at the gold bluffs on the Pacific ocean beaches. The gold bearing region of California is not exclusively confined to the western slope of the Sierra Nevadas, nor can any exact line of division be drawn separating the silver-bearing districts from those which produce gold, but by far the large proportion of the gold has come, and is still being produced from the lower portion of the flanks of the Sierras. In the Coast range mountains very little has been done. The principal auriferous territory and that which comprises a large proportion of the population and the greater portion of the mineral wealth of the State, occupies the western portion of the counties of Mariposa, Calaveras, Amador, El Dorado, Placer, Yuba, Butte, Nevada, Sierra and Plumas, all of which are situated on the eastern side of the two great drainage rivers of the State, the San Joaquin and Sacramento.

Whitney states that in the extreme southern portion of this gold region beyond Mariposa county, the slates almost cease to form the continuous belt, and they are more encroached on by the granites going southward. In fact, there is a gradual decrease in the width of the auriferous formation proper from the north toward the south, and a constant increase in the amount of metamorphism displayed, the granite occupying a large portion of the mass of the Sierra, and descending lower down on its flanks, while the crest of the mountain becomes more and more elevated, its culminating points being in about the latitude of Owens lake, in Inyo county.

The quartz veins are found throughout the State, but are worked to the greatest extent in Tuolumne, Calaveras, El Dorado, Nevada and Sierra counties, on the western slope of the Sierra Nevadas. To the east of the mother lode there exists in the higher regions a belt of veins in the granite formation, which though not continuous are connected, have produced several groups of rich quartz veins, as at West Point and Sheep Ranch, in Calaveras county, Confidence and Enterprise, in Tuolumne, and Volcano, in Amador. In the Bodie district, Mono county, is a group of veins which have produced largely. There are several comparatively isolated groups of mines which have been worked for years. The center of the gold quartz industry remains, as has been the case for years, in Nevada county.

Of late years the general results that have attended the business of quartz mining in this State have been satisfactory. Notable progress has been achieved under the stimulus of capital. Work in many new mines has been commenced and old ones have been worked with more energy. Important economies have been perfected, bringing the business within more fixed and scientific principles. Moreover, with increase of depth, has come increase of richness, and some of our very best mines are our deepest ones.

The Anaconda company, M. T., according to the Review, is getting tired of the high prices paid for Rock Springs coal and will, it is rumored, use coal for mines along the Northern Pacific as soon as the Northern Pacific reaches the town of Anaconda.

The Victor mine has been sold to the English company which recently erected a 30 stamp mill at Candelaria, Nevada. It is expected that the sale will place the camp on its old prosperous footing.

Mining and Milling in California.

It is a noteworthy fact that among those gold quartz mines which have been longest worked in California, are those which are to-day the most profitable, and also that our very deep gold mines—the deepest in the world—are still paying large profits. These facts argue well for a continuance of gold quartz mining in this State, and show that this class of property furnishes as good investment for capital as can be desired.

It is not necessarily the richest ore per ton that brings the largest profit in the end. Low-grade ore in large quantities pays well in this State, when properly worked. For instance, the Plumas-Eureka and Sierra Butte mines may be considered typical low-grade quartz mines, as manifested by their production, the magnitude of their operations, and their permanence both in depth and length. These mines have been continuously worked with profit for over 30 years. They are over 7000 feet above sea level; they have water power for milling, and their wide veins are opened by tunnels on the mountain side. It will be interesting to show, as can be done from the Mint Director's statistics, what it costs to work this ore.

In the Plumas-Eureka mine, Plumas county, where the company own their own 60-stamp mill, the following record of operations for a year may be noted:

MINES.	
Average number of miners.....	per day 225
Miner's wages.....	per month \$65.00
Mining (including dead work).....	per ton 3.52
Milling.....	per ton 0.494
Amount extracted and worked in year.....	tons 55,783
Average yield.....	per ton \$8.72
Sulphurets.....	per cent 1

MILL.	
No. of stamps.....	60
Weight in pounds.....	750
Drop per inch.....	84
Drops per minute.....	80-85
Capacity per 24 hours (tons).....	153
Cost of treatment per ton.....	\$9.494
Crushed in year (tons).....	55,768

Both water and steam power are used. The method of treating sulphurets is by roasting, grinding and amalgamating. The cost of mining includes the sinking of two shafts below tunnel level, one engine and pump in each shaft run by compressed air and steam carried in from surface in 3½-inch pipe, one shaft being situated 3500 feet from mouth of tunnel, and the other 5000 feet. Cost of mining also includes cost of management.

The Sierra Buttes mine has one of the best appointed mills in the State; all the machinery is run by water power. For the 14 years ending in December, 1884, \$2,000,000 had been expended on the mine, and during that time it paid dividends of \$1,360,288 with no assessments. The ore is low grade, but there are immense quantities of it. The following statement shows some details of interest:

MINE.	
Average number of miners per day.....	285
Miner's wages.....	per month \$85
Mining, including dead work.....	per ton \$4.37
Milling.....	per ton \$0.53
Amount extracted and worked.....	tons 47,616
Average yield.....	per ton \$8.18
Sulphurets.....	per cent 1

MILL.	
No. of stamps.....	90
Weight in pounds.....	750
Drop in inches.....	74
Drops per minute.....	84
Capacity in 24 hours.....	tons 70
Cost of treatment.....	per ton \$9.53
Crushed during year.....	tons 47,581

This is a water-power mill, and the sulphurets saved in Frue concentrators, are roasted, ground and amalgamated. The cost of mining includes between 70 and 80 cents per ton; cost of management and office expenses is included. During the period covered by these statistics, for three months fifty stamps were running, for three months 70 stamps, and for the other six months 90 stamps were at work.

These are both low grade mines, but are very profitable. Now let us take a higher grade mine, and take the figures for the same year as those given for the other mines. The Idaho, at Grass Valley, Nevada county, which produced \$364,599 in 1883, and paid \$34,100 in dividends; and produced \$561,895 in 1884, with \$271,250 in dividends.

MINE.	
Average number of miners.....	159
Miner's wages, per day.....	\$3.00
Sinking, per foot, depth 1,100 and 1,200 ft. levels.....	\$25 to \$32
Drafting, per foot, lower levels.....	\$9.00
Mining and milling.....	per ton \$7.86
Tons extracted in year.....	31,143
Average yield per ton.....	\$18.04
Percentage of sulphurets.....	1
Total bullion product.....	\$550,061

MILL.	
No. of stamps.....	35
Weight of stamps (lbs.).....	850

Drop in inches.....	94
Drops per minute.....	72
Cost of mill.....	\$40,000
Capacity in 24 hours (tons).....	100
Tons milled in year.....	\$1,143

In this statement the costs of mining and milling are not segregated.

Of course these three large mines cited are well equipped and outfitted and there has been plenty of money for all things necessary. But they are old mines and deep ones and ought to serve as examples to gold miners to prove that gold mining pays with depth and that \$100 per ton rock is not the only thing to look for. There are many other mines in this State with good futures before them which are just beginning to pay, like the Alaska, Young America, Delhi, and hundreds of others that might be named.

Practical Hydraulics.

This week we publish the concluding article of this series on "Practical Hydraulics" by P. M. Randall, and give his preface to the forthcoming work, as summarizing its contents. A perusal of this preface will show to those who have not followed the details from week to week, what a valuable work of reference is now available. Instead of having to work out elaborate formulae and abstruse calculations, the miner or irrigator can, by this carefully calculated tables given, find out for himself, the answer to almost any hydraulic problem. It will require no technical knowledge to do this, the rules and table simplifying this process. In order, however, to demonstrate the principles of each department, Mr. Randall has, of course, been compelled to use higher mathematics more or less; but in each case, it will be found he has also prepared simple tables and rules which will relieve the ordinary user of water from going into any elaborate calculations.

A work of this character is one which every user of water—millman, miner, irrigator, or engineer—should have at his hand. It is a work of ready reference, adapted largely to the unskilled, but also to the expert hydraulician. The rules and formulae ordinarily laid down in the common run of books are abstruse, and adapted only for engineers. Moreover, they do not have the scope or accuracy desired for the special conditions prevailing on this coast.

Mr. Randall is an old pioneer, and knows and realizes the wants of the people here. His long experience among us has given him a knowledge of our necessities, and he has put into his book just such things as are demanded for our every-day work. An accomplished and practical hydraulician, he recognizes the fact that most people have not the time or skill to go into abstruse mathematical calculations, and hence his many carefully-prepared rules and tables, each representing a vast amount of calculation and verification. No such work as this has heretofore been attempted. Writers have generally contented themselves with a few examples on the various branches, leaving the reader to work out his own results from the formula. But here in Mr. Randall's book, we have the results given in tabular form, to cover every possible case, with all the conditions expressed.

"Practical Hydraulics," in convenient book form, will be ready for delivery in a few days, by the publishers, Dewey & Co. 252 Market street, S. F.

THE Bannock Mining Co. who own the Horn Silver mine at Era, Idaho, have closed a contract with Fraser & Chalmers of Chicago, for a complete twenty-stamp silver mill with power for forty stamps, in order that it may be increased to that number whenever the company deem best to do so. The mill is to be completed by the last of September or the first of October. J. K. Owens will have charge of the construction of this mill. He erected the General Custer, the Sawtooth and the Vienna mills in Idaho. This mill will cost in the neighborhood of \$65,000. John A. Groesbeck, president of the Bannock company, says they propose to have the mill as perfect as possible to do the work they require.

In Denver, Colorado, during 1885, the largest sum paid out for labor in any one class of manufacture, was that by the foundry and machine shops, \$237,062. The newspapers came next, having paid their employees in 1885 the sum of \$227,982. It costs money to run newspapers, as well as foundries.

Chrome.

There is more going on at present in chrome mining in this State than ever before, an impetus having been given to the business by the low freight rates by rail admitting of shipments being made to the East at remunerative prices. California is one of the two important districts of the United States in chrome mining, the other being on the borders of Maryland and Pennsylvania and running into both States. It is found in irregular deposits also in several widely separated districts in the United States, usually in serpentine rock. The Eastern mines of Maryland and Pennsylvania are now practically abandoned, all the ore now coming from the deposits in this State. It is mined here in Del Norte, Sonoma, San Luis Obispo and Placer counties, and lately in Alameda county. The last three mentioned now furnish the bulk of the ore. It has been found, however, in half the counties of the State, and California has been shipping about 3000 tons per year to the East, though this year it is probable this amount will be largely exceeded. Placer and San Luis Obispo have been the largest shippers until within the past few months, but now Alameda county has come to the front with its deposits near Livermore and is doing a large business in mining and shipping. Nearly all the ore goes to Baltimore, but a small amount is exported abroad.
